REPORT

FROM THE

SELECT COMMITTEE

ON

BRITISH MUSEUM;

TOGETHER WITH THE

MINUTES OF EVIDENCE,

APPENDIX AND INDEX.

Ordered, by The House of Commons, *to be Printed*,
14 *July* 1836.

Jovis, 11° die *Februarii*, 1836.

Ordered, That a Select Committee be appointed to inquire into the Condition, Management and Affairs of the British Museum.

And a Committee was appointed of,—

Mr. Estcourt.
Mr. Hawes.
Mr. Ridley Colborne.
Mr. John Parker.
Sir Robert Inglis.
Mr. Thornely.
Sir Philip Egerton.
Mr. Evelyn Denison.
Mr. Compton.
Mr. Clay.
Lord Stanley.
Mr. Elphinstone.
Mr. Bingham Baring.
Mr. Pease.
Lord Viscount Sandon.

Ordered, That the Committee have power to send for Persons, Papers and Records.

Ordered, That Five be the Quorum of the Committee.

Ordered, That the Report which, upon the 6th day of August, in the last Session of Parliament, was made from the Select Committee appointed to inquire into the Condition, Management and Affairs of the British Museum, be referred to the Committee.

Lunæ, 7° die *Martii*, 1836.

Ordered, That Mr. Clay be discharged from further attendance; and that Mr. Marshall be added to the Committee.

Jovis, 14° die *Julii*, 1836.

Ordered, That the Committee have power to report their Opinion, together with the Minutes of Evidence taken before them, to The House.

THE REPORT - - - - - - - - - - - - p. iii
MINUTES OF EVIDENCE - - - - - - - - - - - p. 1
APPENDIX - - - - - - - - - - - - - p. 501
INDEX - - - - - - - - - - - - - - p. [1
PLANS.

REPORT.

THE SELECT COMMITTEE appointed to inquire into the Condition, Management, and Affairs of the BRITISH MUSEUM, and to whom was referred the Report, which, upon the 6th day of August, in the last Session of Parliament, was made from the Select Committee appointed to inquire into the Condition, Management and Affairs of the British Museum; and who were empowered to Report their Opinion thereupon, together with the MINUTES OF THE EVIDENCE taken before them, to The House;——HAVE agreed to the following REPORT:

YOUR Committee have proceeded, during two Sessions, in the discharge of the duty confided to them; and, having now completed a full examination of the several Departments of that Institution, regret to find that their investigation has been necessarily protracted to a period so late as to preclude a reasonable hope of their being able to lay before The House, previous to the conclusion of the present Session, all the opinions and all the grounds on which those opinions rest, so fully as the materials contained in the Evidence, and Documents adduced before them, might, under other circumstances, have enabled them to furnish.

Being however aware that their inquiry has been viewed with considerable interest, they consider that they best discharge their duty by submitting to The House forthwith those opinions to which upon "Resolution" they have come, together with the Evidence and Documents from which those opinions have been deduced.

They therefore beg to Report the following RESOLUTIONS, resulting from the information which they have obtained in the prosecution of their lengthened Inquiry; and to express their earnest hope that The House will give its early and favourable consideration to the suggestions therein contained.

Resolved 1. THAT the great accessions which have been made of late to the Collections of the British Museum, and the increasing interest taken in them by the public, render it expedient to revise the establishment of the Institution, with a view to place it upon a scale more commensurate with, and better adapted to, the present state and future prospects of the Museum.

2. THAT this Committee do not recommend any interference with the Family Trustees, who hold their offices under Acts of Parliament, being of the nature of national compacts.

3. THAT though the number of Official Trustees may appear unnecessarily large, and though practically most of them rarely if ever attend, yet no inconvenience has been alleged to have arisen from the number: and the Committee are aware that there may be some advantage in retaining in the hands of the Government a certain influence over the affairs of the Museum, which may be exercised on special occasions; yet, if any act of the Legislature should ultimately be found necessary, a reduction in the number of this class of Trustees might not be unadvisable.

4. That with regard to the existing elected Trustees, the Committee think it very desirable that the Trustees should take steps to ascertain whether some of those whose attendance has been the most infrequent, might not be willing to resign their Trusteeships. That, in future, it be understood that any Trustee hereafter to be elected not giving personal attendance at the Museum for a period to be fixed, is expected to resign his trusteeship, being, however, re-eligible upon any future vacancy.

5. That in filling up vacancies, it would be desirable that the electing Trustees should not in future lose sight of the fact, that an opportunity is thus afforded them of occasionally conferring a mark of distinction upon men of eminence in literature, science and art.

6. That the extension of the Collections which has taken place, and the still greater extension which may be looked for, render a further division of Departments necessary; and that at the head of each Department there be placed a Keeper, who shall be responsible for the arrangement, proper condition, and safe custody of the collection committed to his care.

7. That it is desirable that the heads of each Department shall meet once in three months, for the purpose of consulting with reference to any matters of detail relating to the internal arrangements of the Museum, which they may desire jointly to submit to the Trustees in writing.

8. That whenever there may be a vacancy in the office of Principal Librarian, or in that of Secretary, it is desirable that the distribution of the Duties now discharged by those Officers respectively, including the Expenditorship, be reconsidered, and that the Office of Secretary be not combined with the Keepership of any Department.

9. That it is desirable that the Hours during which the Museum shall be open on Public Days be hereafter from Ten o'clock until Seven throughout the months of May, June, July and August; and that the Reading-Room be opened throughout the Year at Nine o'clock in the morning.

10. That it is desirable that the Museum be hereafter opened during the Easter, Whitsun and Christmas weeks, except Sundays and Christmas-Day.

11. That it is expedient that the Trustees should revise the Salaries of the Establishment, with the view of ascertaining what increase may be required for the purpose of carrying into effect the foregoing Resolutions, as well as of obtaining the whole time and services of the ablest men, independently of any remuneration from other sources: and that when such Scale of Salary shall have been fixed, it shall not be competent to any Officer of the Museum paid thereunder, to hold any other situation conferring emolument or entailing duties.

12. That it is desirable that the Heads of Departments do consult together as to the best method of preparing, on a combined system, an improved edition of the Synopsis of the Museum: that each Officer be responsible for that part which is under his immediate control, and attach his signature to such part: and that the Work be prepared in such a manner as to enable each part to be sold separately, which should be done at the lowest price which will cover the expenses of the publication.

13. That it is expedient that every exertion should be made to complete, within the shortest time consistent with the due execution of the Work, full and accurate Catalogues of all the Collections in the Museum, with a view

to

to print and publish such portions of them as would hold out expectations of even a partial sale.

14. That it be recommended to the Trustees that every new Accession to the Museum be forthwith registered in detail, by the Officer at the head of the Department, in a book to be kept for that purpose: and that each Head of a Department do make an Annual Report to the Trustees of the Accessions within the Year, vouched by the signature of the Principal Librarian, of Desiderata, and of the state and condition of his own Department.

15. That it be recommended to the Trustees to take into consideration the best means of giving to the Public a facility of obtaining Casts from the Statues, Bronzes and Coins, under competent superintendence, and at as low a price as possible.

16. That the Committee are well aware that many of the alterations which they have suggested cannot be carried into effect except by increased liberality on the part of Parliament, both with respect to the Establishment of the Museum, and also, to a much greater extent, for the augmentation of the Collections in the different Departments: but they confidently rely on the readiness of the Representatives of the People to make full and ample provision for the improvement of an Establishment which already enjoys a high reputation in the world of science, and is an object of daily increasing interest to the People of this Country.

17. That the Committee, in the alterations which they have suggested, do not mean to convey any charge against the Trustees, or against the Officers of the Museum, whose talents, good conduct, and general and scientific acquirements, are universally admitted; and they are aware that where imperfections exist in the Collections those imperfections are mainly attributable to the very inadequate space hitherto available for their Exhibition, and to the limited Pecuniary Means at the disposal of the Trustees; and they are of opinion that the present state of the British Museum, compared with the increasing interest taken in it by all classes of the People, justifies them in the recommendations contained in the above Resolutions.

18. That the Committee, having taken into consideration the Petition presented to The House by Mr. Charles Tilt, and referred to the Committee (which Petition prayed for Public Assistance in the preparation of a Work from the Medals in the British Museum), and having taken Evidence on the said subject, consider that in no way can they more satisfactorily discharge the duty confided to them by the reference in question, than by simply laying before The House the Minutes of Evidence so taken; and ordering the Petition of Mr. Charles Tilt to be placed as an Appendix to that Evidence, and to these Resolutions.

14 *July* 1836.

PROCEEDINGS OF THE COMMITTEE.

Jovis, 18° die Februarii, 1836.

Mr. Ridley Colborne.	Sir Philip Egerton.
Mr. Thornely.	Lord Stanley.
Mr. Hawes.	Mr. Elphinstone.
Mr. John Parker.	Mr. Compton.
Mr. Bingham Baring.	Mr. Pease.

Mr. Estcourt called to the Chair.

DIVISIONS.

Jovis, 7° die Julii, 1836.

Present, Mr. Estcourt, in the Chair,

Lord Stanley.	Mr. Bingham Baring.
Lord Viscount Sandon.	Mr. Compton.
Mr. Marshall.	Sir Philip Egerton.
Mr. Hawes.	Mr. Thornely.
Sir Robert Inglis.	Mr. Elphinstone.

Motion made, and question proposed, by Lord Stanley, That with regard to the existing elected Trustees, the Committee think it very desirable that the Trustees should take steps to ascertain whether some of those whose attendance has been the most infrequent, might not be willing to resign their Trusteeships. That in future it be understood that any Trustee hereafter to be elected, not giving personal attendance at the Museum for a period to be fixed, is expected to resign his Trusteeship, being, however, re-eligible upon any future vacancy. Amendment proposed by Mr. Hawes, to leave out words after "that," for the purpose of inserting, "of Trustees to be elected by the following learned societies; viz. the Royal Society, Antiquarian, Linnean, Astronomical, Geological, Zoological, Statistical, The Royal Academy, College of Physicians, College of Surgeons, and two Universities of Oxford and Cambridge—12," instead thereof.

Question put, That the words proposed to be left out stand part of resolution.

Ayes, 7.	Noes, 4.
Lord Stanley.	Mr. Hawes.
Sir Robert Inglis.	Mr. Marshall.
Mr. Ridley Colborne.	Mr. Thornely.
Sir Philip Egerton.	Mr. Elphinstone.
Lord Viscount Sandon.	
Mr. Compton.	
Mr. Bingham Baring.	

So it was resolved in the affirmative.

Original question put, and agreed to.

Motion made by Mr. Ridley Colborne, That without under-rating the value of rank, wealth, and high station in the character of a Trustee, it is to be regretted that selections are not more frequently made from those men who are distinguished by their knowledge in science and literature, and it is hoped that these considerations will, in future, have their due weight. Amendment proposed by Lord Stanley, to leave out words after "that," for the purpose of inserting "in filling up vacancies, it would be desirable that the electing Trustees should not lose sight of the fact that an opportunity is thus afforded them of occasionally conferring a mark of distinction upon men of eminence in literature, science, and art."

Question put, That the words proposed to be left out stand part.

The

The Committee divided.

Ayes, 5.	Noes, 6.
Mr. Ridley Colborne.	Lord Stanley.
Mr. Thornely.	Mr. Compton.
Mr. Hawes.	Sir Robert Inglis.
Mr. Elphinstone.	Sir Philip Egerton.
Mr. Marshall.	Lord Viscount Sandon.
	Mr. Bingham Baring.

So it passed in the negative.

Question proposed, " That in filling up vacancies, &c." Amendment proposed by Mr. Hawes, after " not," to insert " in future."

Question put, That those words be there inserted.

Ayes 7,	Noes, 4.
Mr. Hawes.	Lord Stanley.
Mr. Marshall.	Sir Robert Inglis.
Mr. Elphinstone.	Mr. Compton.
Lord Viscount Sandon.	Mr. Bingham Baring.
Mr. Thornely.	
Sir Philip Egerton.	
Mr. Ridley Colborne.	

So it was resolved in the affirmative.

Question proposed by Lord Stanley, That the word " occasionally " stand part of resolution.

Question put. The Committee divided.

Ayes, 6.	Noes, 5.
Lord Stanley.	Mr. Hawes.
Mr. Compton.	Lord Viscount Sandon.
Sir Robert Inglis.	Mr. Marshall.
Sir Philip Egerton.	Mr. Elphinstone.
Mr. Bingham Baring.	Mr. Thornely.
Mr. Ridley Colborne.	

So it was resolved in the affirmative.

Resolved, That in filling up vacancies it would be desirable that the electing Trustees should not in future lose sight of the fact that an opportunity is thus afforded them of occasionally conferring a mark of distinction upon men of eminence in literature, science, and art.

MEMBERS PRESENT.

Mr. Estcourt.	Mr. Ridley Colborne.
Lord Stanley.	Sir Robert Inglis.
Mr. Hawes.	Mr. Pease.
Mr. Thornley.	Lord Viscount Sandon.
Mr. Compton.	

MR. ESTCOURT, IN THE CHAIR.

Mr. *James De Carle Sowerby*, called in; and Examined.

1. Mr. *Hawes.*] YOU have published some works on mineralogical subjects?—My father published a work on British mineralogy, and he also published a work on fossil shells; the work on fossil shells I continued, and described the shells and executed the plates for about half of it, after his death.

2. Have you very long turned your attention to subjects connected with natural history?—I have all my lifetime been connected with natural history; my father was collecting when I was quite a child.

3. Are you at all acquainted with the present state of the Natural History department in the British Museum?—I have seen it occasionally, and when I have had to make drawings from any particular subjects that are there, I have gone to consult the specimens.

4. Have you any general opinions to state to the Committee upon the present arrangement of that department?—In relation to the state of the Museum, it certainly would be desirable that it was so arranged that it would be more generally intelligible; that any one that went round might be able to know what the things were that he was examining. A great part of them are not named, and of course a person looking at them would not know where to find any further account of them, nor learn anything more than merely what he saw of the things themselves.

5. Can you give the Committee any instances of specimens that are unnamed?—There are a great many; I hardly know what to pick out. The otter, the bats, the common lobster, are without scientific names. A great number of the birds are without names.

6. Such as are named, are they correctly named?—I believe they are; there may be a little error in spelling, or something of that kind.

7. Are there instances of errors in spelling?—One was pointed out to me the other day by a gentleman who took some shells to the Museum to name them; I looked at the Synopsis, and I found that the name was correctly spelt there, it is the common perriwinkle, and the genus with which it is connected, littorina, is spelt with a single *t* at least 12 times.

8. Sir *Robert Inglis.*] Do you understand it to be a clerical error, or one of ignorance, having stated that on referring to the Synopsis you found it right there?—I think it is a clerical error.

9. Is that the single instance which you can state to the Committee?—I saw another error, which I can hardly think clerical; it is the instance of the euryale, and the genus euryale is named in pencil, and the Latin specific names are put in the neuter gender.

10. Did you compare it in that instance with the Synopsis?—The Synopsis is correct in that instance also.

Mr. *James De Carle Sowerby.*

23 February 1836.

11. Mr. *Hawes.*] Can you state anything to the Committee in reference to the general condition of the objects in the Museum?—I think the general condition is pretty good; there are certainly exceptions; I should say that they are in a much better condition than they were two or three years ago.

12. Are you individually satisfied with the classification and nomenclature?—As far as it goes I am very well satisfied with it; there are of course different systems which different philosophers will pursue, and we must not quarrel upon those subjects; we are not always able to judge which is the best. I would always recommend that a system that is published should generally be the one exposed to public view, because it can be understood, and reference can be had to books for further information.

13. Are you expressing your own individual opinion, or the opinion of scientific men generally?—I should say my own opinion; but I dare say it would coincide with that of most scientific men.

14. Do you think that the departmental divisions of the Natural History department in the Museum are good?—I think they are very much too limited in number; giving the whole responsibility to one person, as I understand is the case, seems to me throwing too much of the different branches into one person's management, so that he can hardly be expected to understand or to execute all that is necessary in them.

15. Are you at all acquainted with the subdivisions in the Natural History department in the Jardin des Plantes at Paris?—Not very minutely. I understand that they have more professors there than we have curators here; I think they have 12 or 13; but then they have departments that are not in the British Museum; we have no garden in the British Museum, no menagerie, no anatomical department.

16. In your opinion, therefore, there should be a further division, with a view to the beneficial exhibition of the objects in natural history generally?—I think it very desirable that the zoologist, the botanist, and the mineralogist, should be perfectly distinct; and even mineralogy should be divided as far as relates to the classes embraced by that department; geology might perhaps go along with it, but organic remains should be under quite another manager. The study of organic remains requires a considerable knowledge of comparative anatomy, conchology, and botany; and therefore it is incompatible with a minute knowledge of mineralogy, which requires chemistry, and even mathematics.

17. Speaking now of the collections in the subdivision which exists in the Natural History department, are they themselves perfect and well arranged?—They are very far from perfect; the mineral collection I should think the most perfect. The birds I can only judge of by there being very great numbers. In the Conchological department I have noticed that there are many deficiencies. The number of species of which there are specimens is not at all equal to the number that is known.

18. As to the arrangement and the nomenclature of the shells in the British Museum, is that satisfactory?—I believe it is as far as it goes; it is the modern nomenclature; it seems to me to be in a state of progress that is very favourable.

19. Are all the specimens named?—No; far from it.

20. Are a large proportion unnamed?—I should say a large proportion. I have not examined them minutely lately.

21. When did you last visit the Museum?—One day last week, but it was for the purpose of looking at Mr. Hawkins's fossils, and therefore I was not above half an hour in the Museum.

22. Sir *Robert Inglis.*] In the opinions you have given, are the Committee to understand that you have compared the collections in the Museum with any abstract standard of perfection, or with other collections in this or other countries?—I cannot say that I have compared them directly with any collections, but I am aware there are collections of shells in this country which contain a larger number of species.

23. Will you state to what collection you allude?—I should think Lord Mountnorris's collection of shells, and the Rev. Dr. Goodall's collection.

24. With respect to the mineral collection, are you aware of any collection in Europe which you would place above the mineral collection in the British Museum?—No, I am not.

25. Are you personally cognizant of the collection at Vienna or Berlin, or at

at any other capital?—I have not seen any other foreign collection than that of the Jardin des Plantes.

26. You have stated that in the collection of birds the species were very numerous; are the Committee to understand that, in your judgment, the collection fails in arrangement either from want of knowledge on the part of the curator, or from want of space in respect to the building?—Ornithology is a subject I have not studied, and therefore I can say very little upon the arrangement of that, but, as far as I have seen of it, it appears to me very fair; the birds are rather crowded.

27. Does that crowded state of the birds arise in whole or in part from the present state of the buildings of the Museum, or from any indisposition, so far as you could ascertain the fact, on the part of those to whose care the collection may be entrusted to provide adequate accommodation?—I think it arises from the deficiency of space in the rooms. There are intermediate spaces between cases that might be filled up in some of the rooms; but I think the bird rooms are quite full.

28. Are you aware of the intention to remove into the new building on the north of the existing building, the zoological collections, as soon as that building shall be prepared for their reception?—No, I was not aware of it.

29. Were you aware of the new building erecting to the north of the existing building, and intended for natural history?—I knew there was a building erecting, but I did not know the purpose of it.

30. Mr. *Hawes.*] Do not you think it possible so to arrange the collections of natural history that they shall be instructive to the general observer, as well as useful to the man of science?—Certainly.

31. Do you think that object is sufficiently attended to in the British Museum?—That object is not effected, because, unless every specimen were so named that some further account might be obtained by reference to books or otherwise, it is impossible that it can be of service to the general student.

32. Is not it also important that, in addition to the names of specimens, there should be some notice of the locality from whence they are obtained?—Certainly, every information of that kind is very useful; the locality particularly so, especially in the Mineral department.

33. As well in reference to the ornithological specimens as the mineralogical specimens?—Certainly.

34. Is that at all attended to in the Museum?—In some instances, but very few.

35. Is it more attended to in private museums than in the British Museum?—Certainly it is.

36. Sir *Robert Inglis.*] Will you state to what collections you refer the Committee as having a preferable arrangement, or a preferable mode of description?—Private collections in the hands of the members of different societies. I should say my father's collection was better named at one time, but it has been broken up.

37. Does the deficiency to which you have referred the Committee arise in any degree from the cause to which your attention was last called, viz. the crowded state of the existing buildings?—Not entirely; I think that labels might be attached to specimens whenever they come under the hands of the curator. I think many years ago that part of the business might have been executed, and the labels might have still remained with the specimens, however they were moved about.

38. Are you aware that in the existing collections the cases are occasionally forced to receive specimens of classes which are distinct, arising solely from the impossibility of displaying them in the existing accommodation?—That may be the case. We find two or three genera, and so on, arranged nearly together; but if they were named, though they were not in a very good order, still they would be useful to any person that should visit the Museum.

39. Lord *Stanley.*] Do you desire that every specimen in the Ornithological department should have appended to it a label, which should give not only the name but the place from which the specimen came, and a general description of it?—It would be sufficient to have the name and reference to some author in which the bird is described, and the place whence it came.

40. Do you conceive it would be possible to effect that, with reference to a great

Mr. *James De Carle Sowerby.*

13 February 1836.

great number of small specimens crowded together, in such a manner that the public would be able to read the labels and descriptions?—I think so.

41. Do you think so, looking at the extent of accommodation which the British Museum now affords?—I recollect very few instances of birds so placed but that a label might be appended and be visible.

42. Sir *Robert Inglis.*] Does your answer refer to the larger specimens in the collection, or are the Committee to understand that it is meant to refer to every specimen even in the entomological division?—I would be understood to refer to every specimen. As an instance of the practicability of the thing, some of the small specimens of shells and the cirrhipedes are named in that way; I think in Dr. Leach's hand-writing; many of them are minute objects.

43. Are you aware of the general division of the Natural History department actually existing in the British Museum?—I find it correspond with the Synopsis, and I believe that is the division which is very commonly followed by naturalists at present.

44. The question refers rather to the administration of the department in the Museum, as under one keeper who superintends the collection of natural history generally, subdivided into zoology and mineralogy; the department of Botany being at present a distinct department, under the title of the Banksonian collection?—Yes, I understand there is that division, and it appears to be sufficient. It would be desirable that the botanical collection were exhibited to the public in some way or other. I do not know how it could be managed.

45. Do you consider that such subdivision is sufficient?—No, I would recommend further subdivision than that; zoology should be more divided, certainly; there are known 150,000 insects, and for these to be practically arranged and made serviceable to the public generally, would require the whole time of one individual with at least one assistant.

46. Are you at all acquainted with the provision about to be made in the new buildings for the collections of the Museum?—No.

47. Have you ever heard any opinion as to the probable accommodation to be afforded?—No, I have not. I stated before that I was not aware that any considerable part, if any, of those buildings were to be applied to natural history.

48. Mr. *Hawes.*] Looking at the Museum as an institution which has long existed and long enjoyed considerable public grants, do you think the want of accommodation is any sufficient excuse for the want of better arrangement and more complete classification?—It may be an excuse for the want of classification, but not, I think, for the whole of the present condition of the Museum; some things might have been preserved better probably. Several of the animals are not well stuffed, and the names have been lost or neglected; but I should think that the former curators might have appended names to the objects, which might have remained with them, such names as could be found in books, and therefore might give some information on the subjects.

49. Lord *Stanley.*] You state that former curators might have attended more especially to their duties; how long have you been acquainted with the officers of the Museum?—I remember the Museum slightly when Dr. Shaw used to go round with the visitors, and then you could hardly understand anything but what he pointed out to you.

50. Then, during the time you have known the Museum, there has been a gradual and progressive improvement in the classification and arrangement to a very great extent?—Yes; more particularly within the last few years.

51. Mr. *Hawes.*] But you still consider it very imperfect?—Still very imperfect; there are immense arrears of business to be done.

52. Can you assign any reason for that imperfection, arising out of the want of sufficient officers, or a better subdivision of labour?—I think there may be three reasons; a better subdivision of labour would require a greater number of officers, and I think some of the officers are too minute in their studies; they spend too much time in the details to give that general attention that would be serviceable in the larger masses, and even the more generally known subjects, attending to things that are very interesting to very scientific persons, but not to persons of merely general knowledge: a third reason is the want of space.

53. Lord *Stanley.*] Will you state to what departments you refer?—The department that has come most under my knowledge has been that of the smaller objects

objects of the Zoological department, such as those that Dr. Leach particularly paid attention to, such as the cirrhipedes.

54. Do you mean in the Entomological department?—Not entirely the Entomological, because there are some others that are equally minute.

55. Will you specify them?—The cirripedes were attended to by Dr. Leach very particularly; they are carefully named; I think it would have been more useful if the higher classes and more common subjects had been named, instead of naming the more rare specimens or the lower classes.

56. What is the length of time since Dr. Leach was at the Museum?—Eight or ten years, I think.

57. These pursuits, to which you state the principal officers have devoted so much of their time, are eminently interesting to very scientific men, and calculated to promote the ends of science?—Certainly.

58. Your complaint then is, that the most scientific officers at the head of the department have devoted their time too much to the higher branches, and too little to the popular uses of the Museum?—Exactly so; so that if I were to recommend any addition to the officers, it would be such as should attend to the more popular branches.

59. As a national institution, do not you conceive that it is desirable that those who have the charge of the departments should devote their attention to the higher branches of the science to which they belong?—There can be no objection to that; in a public institution it would be a good thing to encourage that.

60. You will not recommend that less attention should be paid to those subjects, but that greater assistance should be afforded to those departments, for the purpose of the more general accommodation of the public?—Certainly I think that would be preferable to diminishing the attention that has been paid to the more scientific branches; but if it should be found impossible to do both, then I think that a greater attention should be paid to the larger mass, that is those subjects that come more immediately under the public eye, than to the smaller and more inconspicuous subjects; the former should rather have increased attention, of the two.

61. But if the increase of expense on account of an increased number of attendants in the inferior line were not considered an objection, you think that would be preferable to any alteration of the system, according to which the heads of the department now devote their time to the higher branches?—I think men of science should not be fettered at all in their pursuits; and therefore the heads of the departments should be quite free, I would say independent of one another, to pursue their own studies, and have sufficient attendants under them to enter into the manual details of the labelling and so on.

62. You would recommend then, not an alteration of the system on which the departments are carried on, but an increase of the strength in the subordinate departments?—An increase of strength, and so far an alteration as to render one department independent of another.

63. Mr. *Hawes.*] What do you understand to be the system by which the departments are carried on?—I understand that the head of the Natural History department has another under him, to whom devolves a certain portion of the Natural History department; that under him there are still one or two others; so that there is a gradation downwards, and that they all depend therefore upon one person.

64. You do not understand that the head of the department appoints those who are subordinate to him in that department?—I have understood that he does not; that at least one or two are appointed by the Trustees.

65. Do you think it desirable that that system should continue, that the head of the department should have no control over the officers subordinate to him in that department?—If by "department" is understood natural history generally, I think I would divide it; but if by "department" is understood zoology or botany, or mineralogy, and so on, then I think the superior should have the management of those under him entirely.

66. Lord *Stanley.*] Into how many separate departments would you propose to divide the department of Natural History, now under the superintendence of Mr. König, so as to make each head of the subdivisions the head of a separate and independent department?—I would divide mineralogy and organic remains, now united, into two, and zoology into three; I think it would be about five.

Mr. *James De Carle Sowerby.*

23 February 1836.

67. Would you desire that the two persons placed at the head of the departments of mineralogy and organic remains, and the three persons placed at the head of the departments of zoology, should have authority independent of each other, and not combined under the management of any superior?—I have not considered much the management in that way, with respect to the authority that one should have over the other; but I would rather make them equal to one another, considering them of equal scientific attainments, and that they should act as a society or a committee, assisting one another, and so managing among themselves how the different departments should be arranged.

68. What subdivision would you recommend in the Mineralogical department?—I think mineralogy and geology might go together, but that organic remains should be a separate department.

69. The three departments of zoology; how would you arrange them?—Vertebrated animals, invertebrated animals excluding insects, and insects, which would be entomology.

70. Mr. *Hawes.*] You have visited the Jardin des Plantes?—In the year 1820 I was there.

71. Are you aware of the names of the principal officers of that institution?—I have heard them spoken of.

72. Are they not amongst the most distinguished naturalists of France?—They are the working naturalists, and very active.

73. Are the popular objects of the Museum in France attended to equally with the scientific objects?—I think they are, to a great extent. I observed the effects of that attention in going in and out of the garden; I frequently noticed that even the lowest classes of persons were using scientific names. Latin is perhaps more easily followed in France than in England; but I was struck with the circumstance.

74. The following is a list of the names now at the head of the Jardin des Plantes, from Monsieur Guizot's Report: Messrs. Geoffroy St. Hilaire, Chevreul, Cordier, De Blainville, Brongniart, Gay Lussac, Duméril, Flourens, De Jussieu, Valencienne, Mirbel, Audouin, Ad. Brongniart; are they not amongst the most distinguished men of France?—I believe they are.

75. Is there any scientific institution, in fact, that you would compare with it, in reference to the European reputation of those men?—I think not at present; there is no institution that has so many celebrated names.

76. And yet, in that institution at present, you find that the popular objects are equally attended to with the scientific objects?—It appears to me to be so.

77. Sir *Robert Inglis.*] Do you understand that the British Museum is founded upon the same principles, and directed to the same objects, as the institution in France to which your attention has just been called?—I suppose the objects to be nearly the same, that of diffusing knowledge, and so improving the general intellectual state of the population.

78. Do you conceive that the keepers of the departments in the Museum are, in any sense of the word, fettered (your own word is used, A. 61) in the choice of their pursuits, or limited, in any degree, by the Trustees, or by any authority?—I do not suppose that they are otherwise limited than by want of funds; I suppose that to be the principal limit there.

79. In reference to the statement which you made, as to the imperfect stuffing of certain specimens of natural history, now in the collections of the Museum, are the Committee to understand that such defect is attributable to any fault on the part of the officers of the Museum at the time, or that it arose from the defective quality of the branch of art at that time prevalent in England?—I think it has arisen from the want of taste in the persons employed to stuff the animals, in several instances. The giraffe upon the staircase is very stiff, and the neck of the lama in another place is extremely thin, very much out of proportion.

80. Mr. *Hawes.*] The heads of departments in the French Museum are independent of each other, are they not?—I believe they are.

81. Do they form a board for the management and direction of the affairs of the Museum?—I understand that they do; they act as a society of learned men directing the Museum, each taking his own department, but combining their arrangements together.

82. And they are responsible only to the Minister of the Interior?—So I understand.

83. You have already stated that it is an institution of very high scientific reputation?—Very high; I believe the highest in Europe.

84. With reference to some such board for the direction and management of the Museum in England, are you of opinion that a board so constituted is better than the constitution of the British Museum?—The constitution of the British Museum I understand to be, a number of Trustees, who appoint certain officers. Now, if the Trustees were to appoint a larger number of officers, and give them such powers that they might act in the same way, or nearly so, as the professors do at Paris, I think the constitution of the British Museum would be in that way improved, and that the two systems would be combined very effectually.

85. Would it not be more satisfactory to men of science in general, if they possessed that sort of independence, not only with reference to the particular department but in reference to the board for the general direction of the affairs of the Museum, though still responsible to the Trustees?—I think it would; and I think you would then have men of scientific attainments, who would take the situations more as marks of honourable consideration than merely for the money; they would be considered posts of scientific honour.

86. Mr. *Colborne.*] Do you know anything as to the amount of grants made by the government of France for the support of the Jardin des Plantes?—I know very little of it; I saw the Report of this Committee last week, and there I think there is 404,000 francs for the general expenses; it is about 17,000 *l.* a year.

87. To how many departments of the British Museum would that grant correspond?—I think that grant includes five or six departments, or at least five professors, whose departments are not similar to those in the British Museum.

88. It is rather of the want of larger funds, than of the misapplication of the grants made to the Museum, that you complain?—I hardly know how the grants have been applied, but certainly the sum that is applied appears to me very immense, because I should suppose that from the continual expenditure there would have been a finer collection in some departments.

89 Do you mean then to say that you think the Trustees have applied their funds injudiciously?—I can hardly say that they have done it injudiciously; but there seem to be great expenses in cabinets; perhaps it may arise from the frequent moving, and things of that kind. When I look at the sum of 700 *l.* or 800 *l.* spent in natural history for the purchase of objects, it appears to me a large sum.

90. Do you give that answer after full consideration, or merely as an off-hand opinion?—I have not entered into the minutiæ of the details.

91. Sir *Robert Inglis.*] Are you aware that the grant to the British Museum includes several departments not comprehended in the Jardin des Plantes?—I am not aware that there are any antiquities in the Jardin des Plantes.

92. Is there any library there, which can be so characterized?—I believe not.

93. Are you acquainted with any other foreign institutions besides the Jardin des Plantes?—No.

94. Mr. *Hawes.*] Are you well acquainted with the Synopsis of the British Museum?—Very little; I only looked at it a few days ago.

95. Should you call it either a work distinguished for its science or a work of great merit with regard to its popular character?—I was very well satisfied with the general arrangement when I looked over it; it did not strike me as containing anything very extraordinary in point of science, but quite sufficient for the purpose as a general guide to the Museum.

96. Assuming the officers of the Museum to be men of first-rate science, do you think that the Synopsis bears the trace of great science?—In some departments I hardly think it does, but they are departments that I know little of.

97. Do you think, on the other hand, it is a good popular description of the Museum, well arranged and simply written?—I found it better than I expected, from the reports I had heard of it.

98. Did you discover any defects?—I cannot say that I did.

99. What parts do you think the best?—I am most dissatisfied with the antiquarian department; there is the least information given in that.

100. Sir *Robert Inglis.*] Do you refer to any error, or to any deficiencies, in that part of the antiquities of which you now speak?—I should say deficiencies; I cannot say that I noticed errors. I am not much of an antiquarian, but there

Mr. *James De Carle Sowerby.*

23 February 1836.

are many subjects that I should have liked to receive information about, upon which I could not gain any from the Synopsis.

101. Your objection then is rather to the Synopsis, in that division of it, not being sufficiently popular?—Not sufficiently full.

102. Mr. *Hawes.*] You would not describe it as a scientific work, would you?—It is much superior to many catalogues that we have.

103. What catalogues would you compare it to, which you say are not so good as this?—It is superior to the catalogue of Bullock's Museum, and it is superior to the Synopsis that used to be published of the British Museum.

104. The Synopsis is improved?—Yes.

105. And so is the general information and knowledge of the public?—Yes, for it keeps pace pretty well.

106. Have you seen a catalogue of the collection at Surgeon's College?—No; I have not been there for some time; since their building was taken to pieces.

107. Have you seen any French or German catalogue of similar collections?—I cannot say that I have.

108. Therefore you only compare the Synopsis with the catalogue of Bullock's Museum?—Yes, and the catalogues of sales and of exhibitions generally.

109. Mr. *Hawes.*] In fact you compare it with auctioneers' catalogues?—There are very few others to compare it with; it had not occurred to me to compare it with any, and therefore I am only answering at the moment.

110. Is there any accurate and minute catalogue existing in the Museum, of the subjects of natural history?—I am not aware that there is.

111. Do you think such a work desirable?—I suppose that the professors have some such catalogues, but I do not know. They ought to have.

112. Supposing you, as a scientific man, went to look after some particular specimen, not wishing to trouble the head of the department, are the means obvious and the facilities great of finding it?—The facilities are not great, but to a certain extent a scientific man might find the object he wants; and I suppose if the whole of the Museum were displayed he would find anything he wants.

113. Do you not think it desirable, therefore, that there should be an accurate catalogue of the collection, for the guidance, not only of scientific men, but also the people at large who visit the Museum?—I think it is hardly a practicable thing that there should be a catalogue of all the details; they would be varying every day; but the more extensive a catalogue is, the more generally useful it will be.

114. You would not object to a catalogue being formed at all, because it is subject to variation?—No, I should form it in the same manner that a merchant keeps his accounts; if the page were full in any department, I would number that page and refer it to some other part of the catalogue, where you would find a continuation of it.

115. And then incorporate the addenda in the next edition that came out?—Yes.

116. Lord *Sandon.*] As it is, if you wish to find any particular specimen, or to ascertain whether any particular specimen exists in the Museum, you would have no difficulty, by referring to the classes, in ascertaining whether it was there or not?—If it were there perhaps I might find it, but I should not be able to ascertain that it was not there, because it probably might be in a place to which I had not access. If I want a specimen, I apply to one of the curators, and I have never found any difficulty.

117. Then there are some specimens to which the public have not access?—I believe there are.

118. And to which it is intended that the public should not have access when the whole arrangement is completed?—I cannot say that. I suppose it is intended that the whole should be opened. The insects cannot be publicly opened, because they would be spoiled, but I believe access can be had to any of those by application.

119. Ultimately, when the whole collection is displayed, of course it will be arranged in classes, so that any person knowing in what class the subject ought to be found will be able to ascertain whether it is there or not?—Certainly, if it is understood that every thing is exposed that is possessed by the Museum.

120. Will

120. Will he then be able by looking into the catalogue to ascertain whether the specimens are there or not?—I should say not; but a Synopsis, a little more enlarged than the present one, would be a sufficient guide.

121. Lord *Sandon.*] Are all the specimens shown to the public that would not be hurt by being exposed to the air?—I am not aware that all of them are; I believe there are many that are not at present; I believe they are intended to be exposed.

122. Sir *Robert Inglis.*] You have stated that some objects never can be exposed, on account of the influence of light upon their colours; as, for instance, some of the more delicate specimens of the entomological division; are you aware that duplicate specimens even of those are exhibited at this moment?—Yes, I am aware that a small number is exhibited.

123. In short, that the public may see those rarer and more delicate specimens, and that men of science, if they require it, may see the cabinets in which the great mass of them may be found?—Yes, I am aware of it.

124. Does this mode seem to you to combine the double advantage of a popular exposition of the objects, and at the same time of the preservation of others for the more immediate purposes of science?—It seems to answer it perfectly, so far as I understand it. As an instance of subjects being spoiled by exposure to light, I would refer to the French Museum, where I saw a number of insects destroyed by the exposure to light.

125. When you said, that, looking to the amount annually expended in natural history, you would have expected that a better collection should have been formed, have you analysed that expenditure to see how much has been absorbed in necessary expenses for the purposes of exhibition and arrangement in that department, and how much has been devoted to the mere acquisition of objects?—I understood that the sum of 700*l.* or 750*l.* had been devoted last year to the purchase of objects only.

126. You had in view in your answer the actual amount which had been spent in purchases?—Yes.

127. Mr. *Hawes.*] Are you of opinion that the purchases have generally been judiciously and economically made?—Very generally they have; I have seen some instances where they have not been, but I perhaps may be sorry myself for some that I have made in my own private collection.

128. Are you acquainted at all with those fossils in the Museum, which are called Hawkins's fossils?—Yes, I have seen them several times; I did know some little of them before they came to the Museum.

129. Are you prepared to give any opinion upon their value?—It always appeared to me that above 1,000*l.* was a very high price for them, because a similar specimen or specimens, not very far inferior to the best of them, have been sold for 100 or 120 guineas.

130. Are you aware that some portions of those specimens have been discovered to be artificial?—I was aware of that before they came to the Museum, that a considerable portion was manufactured in plaster. It certainly required some skill to do that, but I do not think it enhances the real value of the things.

131. Were those parts that were manufactured so skilfully done as to deceive the eye, and apparently with the intention to deceive?—I cannot speak as to the intention, the effect was certainly to deceive the eye. I certainly was deceived by them when I saw some of them in the Adelaide Gallery.

132. Certain parts of those specimens were known to be manufactured?—I know that parts were, but I cannot say which parts were, as I saw them in the cases.

133. Did you ever see the plates of those specimens, which were published by Mr. Hawkins?—Yes.

134. Are you not aware that portions in those plates were described as artificial?—Yes, in one plate in particular.

135. Were there portions, over and above those portions, that were found afterwards to be fabricated?—The tail of one has been pointed out to me as fabricated. Only a short portion is represented in the plate.

136. Have you seen the correspondence that has taken place between Mr. Hawkins and the Rev. Mr. Boyle, which was published in "The Times" very recently?—No.

137. Supposing the Trustees were in the habit of making important purchases without consulting previously, in the first stage of the purchase, their own

Mr. *James De Carle Sowerby.*

23 February 1836.

officers, should you think that a desirable course to pursue in reference to the respectability and character of the gentlemen whom they entrust with the direction of the principal departments?—Were I an officer of the Museum, I should certainly feel hurt at such conduct.

138. Do not you think it is a defective constitution which admits of such a state of things?—I can hardly imagine that the Museum could be so constituted as that any gentlemen would do so.

139. Have you any general observations to make on the state of the Museum, or the increased facilities that might be given to the public or to scientific men?—I do not know that I have any observations beyond what have been elicited by the questions.

140. Would you extend the hours of exhibition or not?—I would not; I think there is quite sufficient time for public exhibition, and I have never found any difficulty, as a scientific man, in obtaining admission, or obtaining drawings of any subjects: I have always found the officers very liberal.

141. With regard to the opening of the Museum on general public holidays, do you think it would be expedient?—There are two or three holidays upon which it might be advantageous to open the Museum, those holidays that are enjoyed by clerks in private and public offices; I have one or two friends who are very scientific, but they cannot pursue the study, because they have only two or three days in the whole year to themselves, and on such days they would be glad to go to the Museum.

142. Do you think the opening of the Museum on general public holidays might be beneficial, not only to scientific men, but to the public at large?—I think so. That the people at large would take advantage of it is evident from the circumstance of the Zoological Gardens being very much more attended on Easter Monday and Whit-Monday than on any other days.

143. Do they keep at the Museum duplicate specimens for the examination and inspection of scientific men?—I am not aware that they do.

144. Would it be, in your opinion, desirable or not?—I should think not.

145. Sir *Robert Inglis.*] Would you propose to open the Museum on Good Friday?—I should think it ought not to be opened on Good Friday; from my own principles I would not propose Good Friday.

146. Mr. *Compton.*] Do not you think the living objects in the Zoological Gardens are much more likely to attract the people than the dried and stuffed specimens in the British Museum?—The attendance is not nearly so numerous; but certainly they are more generally admired.

147. Sir *Robert Inglis.*] Will you state to the Committee what you understand, and desire them to understand, by the considerable alterations (*See* A. 130.) made in the specimens purchased from Mr. Hawkins?—I can only state what I believe has been stated before, that the paddle of one, and a considerable number of ribs and portions of the spinal processes and tail have been added to one; but the parts added to the other are not so manifest.

148. Referring to the larger specimen, what proportion does the restored part bear to the whole?—I should think somewhere between a third and fourth part, speaking from recollection at this moment, but without having examined with that view.

149. You were yourself aware of the alterations made in the specimens before they were purchased?—I was aware that Mr. Hawkins was engaged in filling up the vacancies.

150. In the actual exhibition of the larger specimen, can you state to the Committee whether any person now admitted to the Museum can or cannot be deceived as to the identity of the whole specimen, and the integrity of this or that part?—I should suppose not, because the parts are marked of a different colour; but to speak positively about that, I ought to examine the parts minutely, to know whether every part that was actually manufactured has been coloured of a lighter colour, but I suppose that has been done.

151. Are you aware of the value of the Hawkins' collection generally?—I was surprised when Dr. Buckland told me that he had valued it so high as he had.

152. You have stated (A. 129.) that there have been specimens nearly as good sold for 100 guineas; was there ever sold in England a specimen approaching to the larger specimen?—I should say approaching to it, but I do not know exactly how nearly.

153. Would

19

Mr. *James De Carle Sowerby.*

23 February 1836.

153. Would you represent to the Committee, that the specimen to which your attention is now called is or is not the finest specimen you have ever seen?—It is the finest I have seen, certainly.

154. Lord *Sandon.*] If a public body were anxious to purchase any particular collection, can you conceive that they could do better in guiding themselves, as to the desirableness of the purchase and the value of the articles to be purchased, than by referring that question to two or three persons whose names are most intimately connected with the branch of science, such as Dr. Buckland, in this instance?—No, certainly not; but I would hope that those persons would be the persons connected with the Museum.

155. Can you expect that the persons connected with the Museum should be most familiar with every new branch of study which lays hold of public attention?—They cannot certainly always be acquainted with that.

156. Is it certain that the best general mineralogist will always be the best judge of fossil geology?—Certainly not.

157. Is it necessary that every new branch of study should have, however subdivided each branch may be, its representative among the officers of the Museum?—No, because such new branch may be one of very small extent.

158. Mr. *Hawes.*] If the Museum professes to make a collection of that particular branch, should there not be a competent officer at the head of it?—I should say that that officer might be under a higher one in the same branch.

159. If the Trustees propose to make purchases in that particular branch, you think it is desirable that the head of that department should be first consulted?—Certainly.

160. Lord *Sandon.*] Does it follow that when the Trustees are going to make a purchase in any new department of science, that they should make a permanent appointment of an officer who is peculiarly skilled in that department, and best qualified to judge of the value of the articles in that particular department?—To render it necessary to create such an officer, the department ought to be a very extensive one.

161. May not a person be very well competent to classify and to keep in order the specimens of a branch of science, without being the person most competent to refer to as to the value and desirableness of particular specimens?—That may happen to a certain extent.

162. Are you at all acquainted with the ichthyological specimens of the British Museum?—To a very slight extent.

163. Sir *Robert Inglis.*] You have stated that if you were at the head of a department, you would feel hurt at not being consulted in the purchase of any objects in that department; do you mean the Committee to understand that the head of the department of natural history was not consulted in the purchase of the fossil remains collected by Mr. Hawkins?—No; I do not know whether he was or was not consulted.

164. Then the Committee are not to understand that you mean to represent any grievance in that particular case?—No.

165. Are you aware that the first proposition for the purchase of that collection was made to the Museum by a gentleman not connected directly with the establishment?—I am not aware whether it was the first application or not; I understood that an application was made to the Trustees by Dr. Buckland.

166. You have stated (A. 9.) that there was a grammatical error in the designation of the euryale; are you aware whether Lamarck has given the same designation?—No, I am not; I know that Lamarck is far from correct.

167. The designation in question is in fact a quotation from Lamarck, as indicated by the letter L. subjoined to it; are you aware of any other authority which you would represent to the Committee as higher than Lamarck?—I would refer to any grammarian rather than Lamarck; Lamarck is not an authority.

Mr. *Henry Weigall,* called in; and Examined.

Mr. *Henry Weigall.*

168. Mr. *Hawes.*] YOU have paid some attention to the fine arts generally?—I have.

169. And you are an artist by profession?—Yes.

170. Have you considered the subject of taking moulds, with a view of taking casts at a cheap rate from statues of acknowledged celebrity?—I have.

Mr. *Henry Weigall.*

23 February 1836.

171. Are you of opinion that such moulds could be made, and that a supply of casts could thence be given to the public, in the first place with reference to taking the moulds without injury to the statues, and in the next place at a low price?—I am.

172. Suppose the Committee had been informed that these statues were liable to injury from taking casts, what would be your opinion?—This is a question upon which there is very little experimental knowledge in this country; so few have had the opportunity of moulding from ancient statues. I shall therefore refer at some length to my reasons for entertaining the opinion I do on this subject. It must be admitted that a statue can only be injured by defacing its surface, by fracture, and by discolouration. The inquiry then seems to arise, what are the causes likely to produce these effects, and are they likely to occur in the process of moulding. In taking a mould from a marble statue, its surface is covered with small and separate pieces of plaster, which are so arranged and dove-tailed, that when hardened they may not only be removed with safety from the statue, but be placed together again when off the statue in their appropriate positions. This inner mould is then covered with an outer integument of plaster in larger masses, called the "mother-mould," the use of which is to prevent the slightest displacement of any of the pieces of the inner mould; and thus, when the whole is bound firmly together with cords, if the mould be properly made, its inner surface is a perfect counterpart of the surface of the statue from which it was taken. Now, if it can be shown that in this operation no injury necessarily results from the manipulation, or from the materials employed, I think the question may be considered to be decided. Where the surface of a statue is smooth, no one familiar with the subject will hazard the assertion that it will suffer abrasion from the soft and plastic material which, during the operation of moulding, is spread upon it, and which, from the necessity of the case, is put on in such separate portions as to admit of its being taken off, when hardened, without scraping on the surface of the work. It is therefore to chemical action alone, that we are left to account for the injury which by some is apprehended. Now, marble is composed of carbonate of lime and plaster; the material of the mould of sulphate of lime; a little soap is likewise used; and these with water are the only substances brought in contact with the statue during the operation; and it will be seen at once that no chemical action whatever is likely to take place between these substances. The carbonic acid contained in the water is so diluted, and is in contact for so short a time with the marble, that even if its action should be admitted as a chemical fact, its operation is too minute to be perceived, or perhaps even calculated. I may be permitted to add, that I have described the process of moulding to Dr. Turner, the professor of chemistry at the London University, who thinks no injury can, as far as chemical action is concerned, result from it, and allows me to use his name to this effect.

173. With reference to moulding from antique statues, is the operation equally safe as that of moulding from modern statues?—I apprehend that the antique statues are exposed to peculiar hazards, but to none which may not be certainly guarded against by additional care and proper expedients. The surface of some of them is found to be rough, and in some places almost cellular. Here the plaster searching and penetrating into a number of small and irregular cavities, might not be separated by an unskilful workman, without tearing away some portion, however minute, of the marble; but the very simple expedient of filling these cavities with a suitable material (soap is used sometimes, and clay; soap, I believe, is the best), which may afterwards be washed out with ease, is sufficient to prevent any injury from this cause.

174. Is there no danger of fracture, independently of the chance of injury to the surface?—When the process is properly conducted, the danger of fracture arises only from the expansive force, and from the weight of the plaster. The expansive force is generated during the process of setting, by the combination of the water with the sulphate of lime; and against this the operator should use a threefold precaution. He should never place any considerable quantity of moist plaster in such a position that its expansive force will have to be resisted by the sculpture; he must so arrange his pieces, that should the expanding force last longer than he has calculated, the tendency of it will be not to injure the sculpture, but to separate and throw off the pieces of the mould (this idea I have illustrated by a drawing); and in those remote and delicate portions

tions of the work, in which the action of plaster cannot be sufficiently watched and controlled, he must invariably use wax. To avoid the risk of fracture arising from the weight of the plaster it is only necessary to watch carefully the accumulation of the mother-mould, and, if requisite, to see that its weight is judiciously supported. With these precautions no fracture need happen; and it was from the neglect of one of them that the Townleian Venus was broken.

[*The drawing was delivered in, and is as follows:*]

Figure 1.

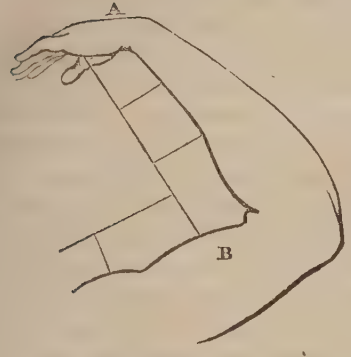

Figure 1 is an outline of an arm, with the pieces of the mould in the inner surface of it improperly arranged. Here the expansive force of the plaster being resisted by the marble at A and B, would most likely occasion a fracture at A.

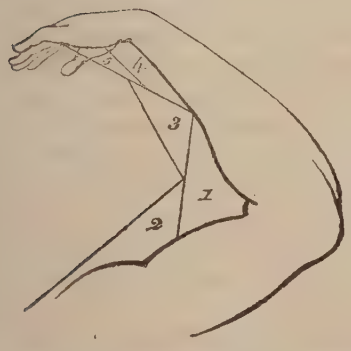
Figure 2.



By the arrangement of the pieces here shown, the expansive force, which begins at the first piece made, No. 1, would, instead of acting against the marble, lift up and throw off No. 2 and 3.

175. Confining your attention to the probable injury to the surface of ancient statues, you are distinctly of opinion that the operation of moulding would not injure the surface?—I am, for the reasons which I have given.

176. Are you aware that a different opinion has been expressed by an artist of some eminence?—I have heard of it.

177. Mr. Westmacott states, in his evidence of last year, that the polish, or what he called the circumlitio of antique statues, would be injured by frequent moulding?—I am sorry I am made to feel I am in opposition to a gentleman for whose genius and attainments I have the profoundest admiration and respect. There is frequent dispute with regard to the nature of the circumlitio, but I apprehend, that for any practical purposes it need not be considered by us; for if it consisted, as some assert, in the addition of some anointing substance to the surface of the ancient sculptures, that substance must have passed away long before they came into our possession; and if it consisted, as others affirm, merely in the surface produced by the exquisite workmanship of the artist, I think I have said enough to show that it will not be injured.

178. Sir *Robert Inglis.*] Do you conceive that the only injury would be a chemical injury to the surface; might not some alteration of the colour be made, which might, in a certain degree, diminish its value as a work of art?—The surface could only be discoloured by an injudicious selection of the material that would be employed to prevent the adhesion of the mould. The Fighting Gladiator in the Louvre was oiled to prevent the adhesion of the mould; and in consequence of that it has been so stained, that the beauty of its form is not easily perceived; the stain interferes with the shadows.

179. Are you aware that from this cause, or from others, there has been no great licence allowed in taking moulds from any of the great statues, the works of ancient art, in any of the collections on the Continent?—I have not had an opportunity of ascertaining, by any direct mode of information, whether that is the case or not; but so far as I can learn from the opinions of those artists who

Mr. *Henry Weigall.*

23 February 1836.

have been abroad, there is no great restriction imposed upon persons desirous of moulding in the Vatican.

180. Are the Committee to understand that it is your opinion, founded not upon personal knowledge, but upon inquiry, that there is no difficulty in procuring permission at Rome to mould the statues of the Vatican?—That is the opinion I form from information I have received in answer to inquiries I have made upon the subject.

181. Mr. *Hawes.*] Speaking now of the antique statues in the Louvre, are there great difficulties thrown in the way of making moulds from those statues?—I believe there is a formatore appointed there, who moulds from the ancient statues, and it is from his moulds that the casts are distributed to the public; by what process I do not know.

182. Lord *Sandon.*] You do not know whether he has a licence whenever he chooses to take a fresh mould?—I do not know.

183. Mr. *Hawes.*] In point of fact, would not all danger of any apprehended injury be very materially diminished, or entirely removed, if a competent person were appointed immediately to superintend the process?—It would be an additional precaution beyond what has ever been used, and I think a sufficient one.

184. In the moulds that have been taken from the Elgin marbles or other works of art in the Museum, do you know whether a competent person has immediately and personally superintended the process or not?—I do not.

185. Lord *Sandon.*] Has not taking the mould of a statue the effect of washing it?—It has.

186. Is it desirable that the ancient statues should be subject frequently to the process of washing?—Occasional and careful washing would not be injurious; the change of colour which takes place is merely the result of cleaning the sculpture, and the original colour is speedily resumed.

187. Sir *Robert Inglis.*] When you state that you do not know that the operation of moulding in the Museum has been performed under the personal superintendence of any artist of eminence, are the Committee to understand that you believe that Mr. Westmacott did not himself take any part in the superintendence of the moulding?—I have not taken pains to inform myself upon that subject. I was not aware that that would be the kind of information required of me in coming here.

188. Then the Committee are to understand that you do not know anything upon that subject?—Nothing.

189. Mr. *Colborne.*] These answers all refer to marble statues. How is it with bronzes?—I should think there would be less risk, if possible, in casting from bronzes.

190. Would it affect the colour?—I think they might be cast without affecting the colour; it would depend a good deal upon the nature of the bronze (I mean as respects the quality of the colour), and the surface of the bronze; the rougher bronzes would certainly require more care than the smooth bronzes.

191. Sir *Robert Inglis.*] Is there not a chemical process to which the plaster exposes the bronze?—I do not think there is any that would be injurious; but I should not mould a bronze in plaster, but in wax.

192. Mr. *Colborne.*] Are there not many casts taken from bronzes in plaster?—It can be done; but as there is a difference of opinion with regard to the expediency of moulding bronzes in plaster (whether the objections are founded in reason or not I cannot say, I believe they are not), I should select the most unobjectionable mode.

193. Lord *Sandon.*] You said that ancient statues, after having been washed by the moulding, resumed their colour; do you suppose that a constant washing would not produce ultimately the effect spoken of; if you were to expose an ancient statue once or twice a year to moulding, with a complete moistening of the surface, and a complete washing off of all that might have adhered to it, might there not ultimately be changes of colour produced by it?—I cannot say that there would not, but I do not believe there would. But the process of moulding is not necessary to be performed upon a statue so often. Once in many years would be sufficient.

194. You mean that the mother-mould would be sufficient?—The mother-mould is the outward integument of the inner mould; but as soon as the perfect

perfect mould is obtained, the cast should be taken from it, from which another mould should be made, and from this the casts should be multiplied.

195. You think there would be a risk in constantly taking moulds from the statue?—The mere attrition consequent on constantly taking moulds would be inexpedient.

196. Are there particular substances used in polishing up even modern statues, which washing would remove; did not Canova use particular substances which he rubbed into the marble, which washing would remove?—Modern statues are not frequently polished; and I am not aware that Canova assisted his surface by the use of such a substance as the question describes.

197. Alluding to modern statues, is it not the fact that Canova himself applied a substance to give it a peculiar hue?—I do not know that he did. On those of his works which I have seen there was no appearance of anything of this sort. He attended particularly to the completion of his surface, which I have heard he produced by casting a strong light upon it in such a manner as to detect the slightest imperfection, and of course removing it.

198. Mr. *Hawes.*] Looking at the risks of possible injury in moulding from the antique statues, do you conceive that they are so reduced by employing competent superintendence in making the moulds, as to make it desirable to make an effort to supply the public with casts of the finer statues at a cheap rate?—I really do; but if any doubt should appear to the Committee still to hang over this subject, might it not be expedient to make inquiries of other countries where collections possessed for a longer time, and perhaps a more liberal diffusion of casts from them, may have given rise to information which we in this country do not possess?

199. Do not you think that if the public were so supplied it would tend very much to the improvement and purification of the public taste?—I think it would, undoubtedly.

200. Is not that a general opinion among artists?—Yes, I believe it is.

201. Would it not also facilitate a knowledge of design generally amongst the working classes, where their particular avocations rendered such an acquirement necessary?—I should think it might have that effect.

202. Would provincial museums, by such an arrangement in the Museum as that of a formatore and a competent superintendent, be able to supply themselves with fine casts at a cheap rate?—Yes; at about one-third of the price at which they are at present obtained.

203. Can you inform the Committee of the price at which a large statue could be furnished to the public, supposing the Government to take upon itself the cost and superintendence of the moulding?—The expense of the Ilissus, for example, in the Museum, would be, I should think, for about six hundred weight of plaster, 36 *s.*; for labour, about 15 *s.*; and the iron inside, which might be necessary, 5 *s.*

204. And the labour of a person of some skill to superintend?—A superintendent would not be necessary in casting from a mould. The expense would be from 56 *s.* to 60 *s.*

205. What number of casts can you take from one mould?—I have never seen a mould worn out, but I have seen a cast from a mould that has had upwards of a hundred taken from it, and the joints of the mould, which are the parts that first indicate wear, were not at all impaired; but I do not mean to be understood that a mould is imperishable.

206. *Chairman.*] Then you apprehend that, if this new department of formatore was established in the Museum, there would then be a total absence of the danger you have described to arise from taking the casts?—I think so, not calculating upon the chances arising from negligence and carelessness; there is nothing necessarily in the process, I think, to produce injury.

207. Assuming that the officer so appointed by the Museum is in every respect competent to superintend that very nice and delicate work?—Yes.

208. Sir *Robert Inglis.*] Have you ever been at the gallery at Paris, and ascertained there the regulations under which the establishment of the formatore is conducted?—No, I have not.

209. Can you state to the Committee any general idea of the extent of the locale which would be required for the purposes of a formatore, if adopted in the British Museum?—There would be considerable room required. An esta-

Mr. *Henry Weigall.*

23 February 1836.

blishment of that sort should have a depository for the first casts from every mould.

210. Which first casts ought to be kept permanently in the depository, to mould from in future?—Yes.

211. Mr. *Hawes.*] Have you heard that there has been an application made by the French Government to the English Government for copies of the finer statues in the British Museum?—I have heard of it, through Sarti.

212. Are you of opinion that it might be complied with, provided the moulds were taken under the personal and immediate superintendence of competent artists?—Yes.

213. That neither the surface of the statue would be injured, nor would damage be done by breakage or otherwise?—Yes.

214. How many casts do you conceive could be taken from a mould so made under your own superintendence, for instance?—I should rather make a permanent mould from the cast, because, to ensure the enduring of a mould, the plaster should be made very hard; very little water should be mixed with it. I should mix the plaster weaker to mould from the original statue, and having got one perfect cast from it, then I should make a strong mould, from which I should think two or three hundred casts might be taken.

215. In point of fact, it would be necessary to mould from the principal statue very often, to supply the public demand?—Very seldom indeed, unless accidents should happen.

216. At all events, public institutions might be amply supplied without doing that?—Yes.

217. Do you conceive that it would require extensive premises and many hands, or an extensive establishment, to accomplish this object?—I think it would require two moulders and a superintendent. I do not know what business the demand of the public for these things might create; it might create so much as to require distinct superintendence.

218. Sir *Robert Inglis.*] From what you know of any similar establishment, can you state at all generally the extent of surface which would be required for such an establishment, and the light that would be necessary for it, and the number of furnaces?—No furnaces would be required; the plaster would, of course, be purchased of the manufacturer of the article. There would be a dry-room necessary, to keep the moulds in; and a room, no matter whether light or not, to keep the first casts in. Those things would not require tasteful arrangements, of course.

219. Looking at them merely as in a magazine or warehouse?—Yes.

220. But looking at them in that way, what area do you suppose that such a depository would require, and how far do you consider that the existing ground at the disposition of the Museum could supply such accommodation?—Really I know very little of the capacity of the Museum, or of the ground that may be at its disposal.

221. What area do you think would be required?—That is a question which I should not like to answer without further consideration.

222. Mr. *Hawes.*] With reference to the great room in which the Elgin marbles are exhibited, do you conceive that that room and the statue galleries generally are well lighted for the purpose of exhibiting the works of art contained in them?—I have heard the light in the new room objected to, but I think the objection is inconsiderately made. I think those who object to it do not sufficiently consider the difficulty of getting a sufficient body of light into such a large room without getting cross-lights. Now, I have looked at the room particularly with reference to the objection which I have heard made, and I think as much has been done as could be done to check and separate the cross-lights.

223. Therefore, speaking generally as an artist, you are satisfied with the lighting of the room?—Yes.

224. Lord *Sandon.*] As an artist, you would not desire to see the small objects of statuary, which generally compose such a collection, in places as large as those in which the Egyptian remains are exhibited?—Certainly not.

225. You think it desirable to keep a due proportion between the size of the subjects and the size of the room?—Certainly.

25

Jovis, 25° die Februarii, 1836.

MEMBERS PRESENT.

Mr. N. W. Ridley Colborne.	Mr. Compton.
Mr. Hawes.	Sir Robert Inglis.
Mr. Bingham Baring.	Mr. Elphinstone.

MR. N. W. RIDLEY COLBORNE, IN THE CHAIR.

Mr. *Henry Weigall,* called in; and further Examined.

Mr. *Henry Weigall.*

25 February 1836.

226. Mr. *Hawes.*] YOU wish to make some additional observations to the evidence you gave to the Committee at the last time of its meeting?—I do, so far as regards casting from bronzes. The chief injury that I should fear bronzes would suffer from casting would be discolouration arising from the greasy substance that is generally used to prevent the adhesion of the mould. If the bronzes would bear washing sufficiently to remove this substance, they would suffer no injury from casting in plaster, and this should be ascertained by careful experiment. The colour of the ancient bronzes differs in its quality; on some it is more durable than on others, but on all much more durable than on the modern bronzes: but I should, to prevent the possibility of risk, mould them in wax; and I will describe the process by which moulds may be made in wax, both from large and small objects; I do this in consideration of the anxiety manifested by some persons upon this subject, not that I believe it is really necessary; I believe it may be done without. The advantages of the process, if any, are, that the material has no expansive force, and brings less moisture upon the marble, and no grease upon the bronze. It has been asserted to be impossible to take a large mould in wax; and the real difficulty has been that, in moulding from large objects, the pieces cannot be made large enough; for as wax can only be brought in sufficient contact with the marble by manual pressure, the pieces thus made are necessarily so small, that they will not, when off the statue, keep their relative positions with the exactness required; but I apprehend that all difficulties may be thus surmounted: Adhesion is to be prevented by covering the surface of the statue with an impalpable powder (Venetian talc, ground fine, will do for the purpose), and then by preparing the wax properly, by taking the mould in the first instance in small pieces, and while these pieces remain on the statue (if the statue is large), joining a suitable number of them together, by backing them with plaster, the object may, if desired, be accomplished. Neither are the greater expense and less durability of the wax moulds very great objections; for after one perfect cast has been obtained, a mould in plaster, called a sopra-forma, may be taken from it, by means of which casts may be indefinitely multiplied, without operating again on the original sculpture; the wax may then be used again for another mould.

227. Then your opinion is generally, that even from the finer bronzes, such as are now in the collection of the Museum, casts might be taken without any chance of injury to the bronzes in question?—I think casts may be taken from any bronzes without injury.

228. And it is also your opinion that the circulation of the casts of such finer works of art in the Museum would be conducive generally to the improvement of the public taste?—I am not so well acquainted with the bronzes in the British Museum, for I generally go to the Sculpture Gallery; but of course the circulation of anything that is beautiful in art must be expected to have a beneficial influence on the public taste.

229. Do you believe that if such casts were obtained at a cheap rate, they would meet with a ready sale?—I should think they would.

230. Have you any additional observations that you wish to make in reference to casts from sculpture?—It has occurred to me, that the collection of casts in the British Museum is by no means so extensive as it should be, and that it would

Mr. *Henry Weigall.*

25 February 1836.

would be a very advantageous thing if a collection of casts from all the antique statues known to be in existence could be made and deposited in the Museum for the inspection of the public. Such a collection, I am persuaded, would be a source of great interest to the public; and it would be a school of instruction for our artists, perhaps the richest and the purest that it would be in the power of this Government to form. There is a great deficiency of casts in this country likewise from the works of the celebrated sculptors that lived about the 15th century. Few artists, who cannot travel, have had the opportunity of studying directly from the works of Donatello, of Michael Angelo, of John of Bologna, and Benvenuto Cellini, for our chief acquaintance with the works of these artists is from prints. I do not remember that I have seen casts from Cellini's works.

231. Are there no authentic casts in this country from the works of those artists?—With the exception of the Dead Christ, by Michael Angelo, at Somerset House, and two casts, by the same artist, at the Colosseum, I know of none that the public generally have ever the opportunity of obtaining access to.

232. You think it would be important to create a department in the Museum for the collection of casts from the statues of acknowledged celebrity in Europe?—If such a collection were made, it would be one of the finest schools of art in the world.

233. Are you at all prepared to state anything with reference to the establishment necessary, and the annual expense for such a purpose?—There would be considerable space necessary, but I would rather have them in a wooden shed with a skylight over them, than not have them at all. I am not prepared to state what the annual expense would be, but I think there would not be much expense in forming the collection, because if moulds were taken from our collection of sculpture, and casts presented to the foreign governments, I have no doubt that they would reciprocate the gift, and the collection would be made by that means.

234. In your former examination allusion was made to a request made by the French government for copies of our principal statues: supposing the Government and the Trustees should grant the request, would it not be a good opportunity to solicit copies from their more celebrated statues?—Yes, I suppose it would.

235. And thus a commencement might be made of the plan which you propose?—Yes.

236. Sir *Robert Inglis.*] In reference to the collection of casts to which you have called the attention of the Committee, do you conceive that it ought in preference to be in the Museum or in the National Gallery or in the Royal Academy?—I should say not in the Royal Academy, because restrictions would necessarily be imposed upon the public with regard to their admission to it; it might be at the British Museum or at the National Gallery, either institution being open. I should think it would be immaterial.

237. Your object then is rather to suggest to the Committee the expediency of the formation of such a collection than the precise spot in which it should be placed?—Certainly; my object is chiefly to direct the attention of the Committee to the destitution of the country in this respect.

238. Mr. *Hawes.*] You suggest this plan in fact as the foundation of a great school of design?—With that view entirely; and feeling the need of such a collection myself.

239. And the Museum being the deposit of the principal statues in the possession of the Government of the country, you think it might be connected advantageously with that Institution?—Yes, I do.

240. *Chairman.*] But at this moment there is no room or space or convenience that you are aware of for such a thing?—I know very little of the plan of the Museum, but the Elgin marbles were for a long time deposited in a very economical building, and I should think a building of the same sort would do. I should suggest, if expense is an object, a mere shed with a skylight over it.

241. Mr. *Hawes.*] In fact such a shed as now exists containing the casts presented to the Museum by Sir Thomas Lawrence?—A narrower and less lofty building would do; but I presume it would be necessary to have it much longer.

242. *Chairman.*] Has any cast been taken of that beautiful little bronze Mercury left by Mr. Payne Knight?—I am not aware of any; but I have seen a cast

a cast made by Sarti from a beautiful bronze of Hercules, in the possession of Colonel Leake; and Sarti told me it was not injured at all. Mr. *Henry Weigall.*

243. Mr. *Baring.*]—Has the Academy any collection of casts at present?—They have a collection of casts, but not one so extensive as that which I now suggest, nor can it be so open to the public as I think it would be expedient the collection I hope to see made should be. 25 February 1836.

244. Do you know of what that collection consists?—I could not pretend to give an inventory of it. I would beg leave, before I withdraw, to suggest that the collection of casts might be extended to the architectural sculpture and monumental remains of the middle ages.

245. *Chairman.*] What does that include?—Some very interesting and beautiful specimens of art, of which Mr. Flaxman, in his lectures, says, "The sculpture of Wells Church presents the noblest, most useful and interesting subjects possible to be chosen. On the south side above the west door are alto relievos of the Creation, in its different parts, the Deluge and the Important Acts of the Patriarchs;" in referring more particularly to the Creation, he says, "there are many compositions of the Almighty creating Eve, by Giotto, Buon, Amico, Buffalmaco, Ghiberti, and Michael Angelo. This is certainly the oldest and not inferior to any of the others." He further says, "the monuments of Aylmer de Valence, Earl of Pembroke, and Edmund Crouchback, in Westminster Abbey, are specimens of the magnificence of such works in the age we are speaking of. The loftiness of the work, the number of arches and pinnacles, the lightness of the spires, the richness and profusion of foliage, and crochets, the solemn repose of the principal statue representing the deceased in his last prayer for mercy to the Throne of Grace; the delicacy of thought in the group of angels bearing the soul; and the tender sentiment of concern variously expressed in the relations ranged in order round the basement; forcibly arrest the attention and carry the thoughts not only to other ages but to other states of existence."

246. Mr. *Hawes.*] Then you think it not only important that there should be a collection of casts from classical statues, but that that collection should extend to the national monumental remains?—Yes; it would undoubtedly be a source of great interest and advantage to the artists of this country, supposing that it is practicable.

247. Would it also lead to their better preservation?—I should think so, it might have that effect; it would most likely induce the public to appreciate their value.

Robert Edmond Grant, M. D., called in; and Examined.

248. Mr. *Hawes.*] YOU are Professor of Comparative Anatomy and Zoology in the University of London?—I am. *R. E. Grant*, M. D.

249. And you have held that office for eight years?—I have.

250. You are also a Fellow of the Royal Societies of London and Edinburgh?—I am.

251. Are you at all acquainted with the Natural History department in the British Museum?—During my residence in London I have taken many opportunities of looking into the natural history collections, especially those which relate to zoology, in the British Museum.

252. Do you consider the zoological collection in the British Museum so exhibited, so classed, and so named as to be most conducive to the instruction of the public, and most useful to scientific men?—The mode of exhibition of the zoological specimens, to which I shall chiefly confine myself in my evidence before this Committee, their classification and their nomenclature are not such as one would expect to find in the great National Museum of the capital of England, and in the present advanced state of zoology. But this is so comprehensive a question that it will require me to consider the clauses of it separately; first, as relates to the mode of exhibition, then the arrangement adopted, and, lastly, the nomenclature employed. The apartments of the old building, in which most of the animals are at present exhibited, are from their whole structure very ill adapted for the convenient exhibition of such objects. From their great height, their darkness, and the confined structure of the apartments in which the different zoological specimens are most inconveniently placed for their due preservation, for consultation, and for all purposes of practical

R. E. Grant, M. D.

24 February 1836.

tical utility. The lofty saloon in which the quadrupeds are placed is entirely without a gallery, and the low cases for containing the large quadrupeds do not reach to one third of the height of the apartment from the floor; the whole upper part of that saloon, unfit for the exhibition of specimens, is quite dark from the sombre character of the old paintings with which it is still covered; the cases are so small compared with the extent of the present collection of the mammalia, that they cannot possibly be contained within them, or placed in systematic order. Many of the most interesting and rare specimens of that class are exposed to destruction from dust and insects, are completely excluded from all systematic arrangement, and wanting their scientific names, are placed in the most confused manner about the lobbies, the staircase, the tops of cases, and in all parts of the house. From the inconvenient forms and the limited extent of the apartments allotted to most of the other zoological collections, or from some other causes best known to the officers, there is the greatest confusion in the manner in which they also are disposed. In passing from the quadruped room in which the specimens even contained in the cases are not placed in zoological order, we come to a second, lofty, dark and confined room, in which there are collected all kinds of specimens from the class of mammalia down to the corals, specimens of animals, dried and in spirit, belonging to almost all the classes of the animal kingdom, zoophytes, quadrupeds, annelides, mollusca, insects, amphibia, serpents and crustacea. In the next succeeding and similarly constructed room, partly likewise no doubt from the limited extent of surface adapted for exhibition, again we find grouped together animals of almost every division of the animal kingdom. For the satisfactory exhibition to the public and the man of science, of the objects at present in the possession of the British Museum, there would obviously be required a much larger space than is at present afforded. With regard to the general distribution of the materials and their classification, from what I have stated of the locale in which the specimens are now exhibited, it will be evident that the general classification of the zoological specimens is not such as becomes our great National Museum, although a more strict attention to scientific arrangement is paid in some of the classes where space permitted. With regard to the naming of the specimens, a great number of deficiencies must strike every scientific observer in the British Museum, both as to the unscientific names actually attached to many of the specimens, and in reference to the total want of specific names in the greater part of the whole zoological collection.

253. Your observations as to the imperfections of the arrangement refer rather to the want of accommodation which exists at present in the buildings of the Museum?—In so far as relates to the accommodation of the specimens, I certainly do consider the limited space for exhibition, and the unsuitable structure of the apartments in which the specimens are placed, as the principal circumstances which have so long deprived the zoological collections of the British Museum of all practical utility.

254. Supposing the Committee should be informed that new buildings are erecting and about to be erected, and that no arrangements have been made by consulting with the officers for the exhibition of the Natural History department, should you not be disposed to think that it would be desirable that some understanding upon this subject should be come to with the architect at once?—I should think that if such an omission had occurred with regard to new buildings proposed to contain the whole series of zoological collections, that the utmost confusion in the architectural arrangements would result, and that a repetition of the same inconveniences which are at present experienced in the old building would be experienced in the new, that is both with relation to the most suitable structure of the apartments for the due exhibition of each of the several classes of animals, and with regard to the extent of space necessary for their due accommodation and protection.

255. Do you conceive it possible to arrange a collection of zoological subjects in such a manner as at the same time to be useful to the student in the science of zoology, and also attractive to the public generally visiting the Museum?—From my own observations made in the museums of the Continent and those also of the British dominions, I would venture to give it as my opinion, that the most strict attention to zoological or systematic classification in the arrangement of the specimens would be calculated to render the most extensive collection

lection not only in the highest degree attractive to the public, but likewise to interest and instruct the student of zoology, by pointing out to them in the most agreeable and satisfactory manner the natural affinities of the immense series of objects belonging to the animal kingdom, by presenting to their contemplation the whole continuous chain of beings, from the lowest corals up to the highest animal forms that exist: indeed without that strict systematic classification of the objects in so vast a domain of nature as that which zoology embraces, the mind passes vacantly from one interesting object to another perhaps totally dissimilar, and there can thus result no interesting or useful reflection to the student or the uninstructed visitor, nothing indeed but a tiresome confusion of thought, from the contemplation of objects so numerous and diversified grouped together without any perceptible bond of connexion.

256. There can be no doubt then, from what you have stated, that if such a collection as that of the British Museum were arranged in scientific order, it would be highly serviceable to the zoological student?—It would, I think, not only be highly serviceable to the zoological student, but it would be in the highest degree beneficial for the improvement of the public taste, and would greatly facilitate the inquiries of the experienced naturalist.

257. Do you think it advisable that each class, order or family of a tribe should have displayed, in the case or cases allotted to it or them, the organs upon which their several divisions are founded?—In a collection which was strictly zoological the displaying of the internal parts of animals beside their mounted skins, would often be attended with great inconvenience, and would be calculated very much to impair the beauty, and to disturb the uniformity, of a natural series of mounted skins, and to create confusion in the general appearance of the collection so arranged. If I might still extend the answer to that question a little, I would endeavour to present to the minds of the Committee the kind of inconvenience which such a mixed classification of objects belonging to comparative anatomy and zoology would produce. For example, if there were exhibited a series of mounted specimens of the elephants of Africa and of India, if along with those were placed the skeletons of the different varieties of the Asiatic and the African elephants, the space occupied by those large specimens of one single genus, would be so great that the wall-surface corresponding to them would be so extensive and so obscured by their shade, that it could hardly be advantageously filled up with the small spirit preparations, the inflated and dried viscera, and the vascular preparations which would belong to that single genus; there would necessarily be great want of symmetry in a mixture of objects so heterogeneous, many minute objects would be obscured by the bulk of others, or there would be great spaces left vacant upon the walls. Or if the next genus had its parts arranged along with those, confusion to the greatest extent would be introduced. For all purposes of comparison, utility or beauty, skeleton should be placed with skeleton, skin with skin, brain with brain, heart with heart, and all zootomical preparations arranged anatomically or physiologically. I therefore think that the French, who are before us in their views of the classification and arrangement of the parts of animals, and in their whole knowledge of such subjects, have acted with great judgment and sagacity, in forming a distinct cabinet for all the structural preparations of the animal kingdom; and such a cabinet in the British Museum might be imitated by appropriating a distinct place for the zootomical specimens. As the question, however, referred more especially to those particular parts of the several animals on which the general classification was founded, I would say, with reference to that part of the question, that all the classifications of zoology are or ought to be founded on a comprehensive knowledge and comparison of the entire mechanism of animals; and the more attention zoologists pay to the internal structure of animals, the more they find it necessary to extend or to alter the general principles of their classification, and the characters upon which all the subordinate parts of that classification are founded. If you were, for example, to cut out from the elephant a piece of thick skin to show the common character of *pachyderma*, or, in order to distinguish the African from the Asiatic species of this genus, if you were to cut out the part of the frontal bone which is convex in the African and concave in the Asiatic, and to exhibit the ears, the hoofs, and the teeth, a group of most heterogeneous specimens would be exhibited, and a collection would thus be formed, which would be, I think, neither instructive nor pleasing to the general spectator, nor satisfactory

factory to the scientific zoologist. Often the zoologist in his divisions is obliged to select parts of the body for his character which could not with decency be cut off and exhibited alone, as the parts which relate to reproduction and lactation in cheiroptera and marsupialia, or he may take his zoological characters from external tegumentary parts, obvious on the entire specimens, and which are comparatively of too little importance in the economy of the animals, or in their physiological interest, to be exhibited separately. I therefore think that even a selection of such anatomical parts of the orders, genera and species, or of larger groups, as related to the classification, would not be advantageously placed in a collection purely zoological: and if the collection be not purely zoological, but a kind of mixed cabinet of zoology and comparative anatomy, it would be liable to the objections I have already mentioned.

258. Are you aware what classification is generally adopted throughout the collection of the British Museum?—I have partly answered that question in the observations which I made respecting the present confused distribution of the objects accumulated in the British Museum; that there were found collected together in the same apartment specimens of all kinds, from the highest to the lowest classes, and that this confusion is repeated throughout different apartments, as can be seen indeed by inspecting the printed catalogue of the collection.

259. You find that there is no systematic classification adopted?—With regard to the general disposition of the whole of the objects, it has not been practicable, perhaps, in the limited space, to adopt a regular systematic zoological order in the distribution of the objects; but in descending to the examination of the subordinate divisions of the animal kingdom, attention has been in part paid to approved zoological systems in the distribution of the objects belonging to the several classes, where space has permitted.

260. Is it your opinion that the classification of any one zoologist of known character should be adhered to throughout the whole collection; or do you think it would be advisable to employ in different departments the arrangement of Temminck or Cuvier, or other distinguished men, instead of adhering to any one system for the whole?—The division of labour is nowhere more advantageous and necessary than in the study of that vast field of inquiry, Zoology, and that useful division of labour has been especially observed among the continental zoologists, particularly of France. And the result has been, that those who have laboured exclusively upon one department, for example, on the *articulated* classes of animals, have been able to detect and to point out nice relations of families, and distinctions or divisions of subordinate groups, which could not have occurred to the mind of a naturalist who had not so devoted himself to the study of that vast division, or who had been more exclusively occupied with the study of the molluscous classes of animals, or who had been occupied during the greater part of his life in the study of birds or of quadrupeds, or of reptiles or of fishes. As that is the case with all the classes of animals, and as no existing system embraces the advantages and improvements of all, it is almost impossible, either in this country or on the Continent, to exhibit the objects in a great national museum, with due regard to science or with advantage to the public, according to any known general system suggested by any one individual; but such collection would be most advantageous to the public and to science when the results of the labours of all the several individuals who are eminent in their respective departments of zoology have been minutely attended to and their improvements adopted. It is quite possible, though a plan not to be recommended in a great general zoological museum, to adopt the classifications which have been adopted by some one individual. For example, there is a zoological museum at Bologne-sur-Mer which is arranged entirely upon the classification of the Regnè Animale of Baron Cuvier, and that classification, with all its advantages and all its defects, has been strictly followed in that small collection. From what I have stated regarding the absolute necessity of subdivision of labour in so vast a study as that of zoology, it will be apparent that greater advantage to a large museum must arise from its having been arranged with the strictest attention to this subdivision, and to the improvements which have been made by various individuals in different fields of inquiry. This selection of the best authorities has been observed in the arrangement of the zoological collections preserved in the British Museum, where with much judgment the keepers of the several subordinate collections have

have not strictly followed any one particular author throughout all classes of animals, but have exercised their own judgments in selecting from the numerous eminent works which have appeared on different departments of zoology classifications which they conceived best adapted to the several portions of the animal kingdom immediately under their charge.

261. Has it ever occurred to you that besides the specimens which are stuffed and publicly exhibited, it would be advantageous to have unstuffed duplicates in cabinets, for particular examination for instance?—In the present limited state of the collection preserved in the British Museum, I think that such a principle ought not to be much attended to; the limited space which is allotted for the exhibition of objects ought, I think, as much as possible to be made available for the public good, and for the common interests of science, which would be more effected by completing one series of zoological specimens than by attempting to have two imperfect series.

262. With reference to the collections which exist in the British Museum in the different branches of natural history, are they generally in a perfect or imperfect state?—There is a great difference with regard to the degree of completeness in the collections of the British Museum; few of them can be compared with the collections preserved at Paris; and none of them are in such a state of completeness as they ought to be in our great National Museum.

263. Sir *Robert Inglis.*] You state that few of the collections in the British Museum can be compared with those in Paris, and none of them are in such a state of completeness as they ought to be in our great National Museum. Will you state to the Committee what is the comparative rank of the division of Mineralogy, for instance, in the British Museum and in Paris?—I have stated in answer to previous questions, that my evidence before this Committee related especially to the zoological collections of the British Museum.

264. The last answer which you gave (A. 262.) did not so limit the evidence which you had previously given, and upon that ground the question was asked, to what departments especially you would call our attention as being in a state not such as they ought to be in our great National Museum, or as not fit to be compared with corresponding collections in Paris?—Having previously announced that my evidence before this Committee would especially refer to the zoological collections of the British Museum, I did not conceive that any answers which I might subsequently give respecting the collections in the British Museum would be considered as referring to any other department of Natural History than Zoology.

265. In reference to the collections of zoology you were understood to say, in three answers which in the course of your examination you have given, that the objections to which you have directed the attention of the Committee are, in part at least, owing to the limited extent of the surface for exhibition; that the subjects required a much larger space than is at present afforded. Have you examined the mere locale of the mineralogical rooms, so far as to see whether, in the new building, there be or be not such a space as you would think such a collection to require?—I should say that from my observation of the state of the Mineralogical collection, with regard to the means of exhibition and to the extent of the collection, that the large room in which the specimens are at present accommodated, is sufficient (the whole of the wall-surface being employed for this purpose, and when provided above with a gallery) for a collection of minerals of double the present extent, and sufficiently large for the most extensive mineralogical collection which I have any idea of existing now in the world; that is to say, availing yourselves of the whole of that immense space for minerals alone, and removing the objects foreign to the mineral kingdom that at present interfere with the mineralogical collection, that is, the specimens of fossil zoology, at present occupying a large portion of the wall-surface.

266. Do you mean that the room should have a gallery?—Yes; when the extent of the collection shall require it, a gallery, and with cases for minerals around the whole extent of the walls at present occupied with pictures, and all the other available space in the room occupied at present with fossil animals.

267. Mr. *Elphinstone.*] Are you aware that complaints have been made that the present room is not sufficiently light for an accurate examination of the minerals?—I am not aware that that has been complained of, but it does seem

R. E. Grant, M. D.

25 February 1836.

to me of a sombre appearance and rather too dark for the examination of minute mineral specimens.

268. *Chairman.*] Are you acquainted with any other great zoological collections in England?—I have visited for many years during my university studies, and while residing in Edinburgh, the zoological collection preserved in the Royal Museum of the University of that city. I have made repeated visits also to the extensive collection preserved in the Museum of the Zoological Society of Manchester. I am acquainted also from many observations with the zoological collection in the Museum of the Royal Institution of Liverpool, and with that of the Literary and Scientific Institution of Leeds. I have seen the Museums of Oxford, Dublin and Glasgow often, together with most of the collections that exist in this Metropolis.

269. Do you think there is a better arrangement, as to classification and other important points, in any of those establishments than in the British Museum?—So far as the objects are arranged in the Museum of Edinburgh, and so far as the objects are arranged in the Museum of Manchester, I think that classification, or rather the distribution of the great groups of animals, is more attended to than can be done in its present condition, or at least than is done in the British Museum.

270. Is that on account of the space, or from want of method?—Where the collections are small they are more manageable; space, consequently, of proportionate dimensions is more easily obtained for their classification. Such is the case, for example, in the large new building for the zoological collection in the city of Manchester; having ample space there for the scientific distribution of the mammalia and the birds, the objects belonging especially to those classes are placed in scientific order, and are properly named and exhibited. So it is also with the collections in the University of Edinburgh, where the quadrupeds occupy a large hall on the ground floor, and where the skeletons of animals are confined to distinct apartments.

271. Would it not require a space twice or thrice as large as we have at present at the British Museum to make the arrangement that you talk of?—For the present existing zoological collection alone, which is the most crowded part, I believe, of the contents of the British Museum, it would require at least double the present space to exhibit the specimens in such a manner as to be either advantageous to the student or the naturalist, or interesting and useful to the public.

272. Would it require also not only to double the space, but to double the staff to attend to it?—I would say that it would require more than to double the zoological staff, in consequence of the numerous accessions of specimens which might be expected to arrive from the colonies, in different parts of the globe, at a great National Museum, properly organized in the metropolis of England, for the preservation and exhibition of the objects of the animal kingdom.

273. Mr. *Hawes.*] Do you think that doubling the staff would necessarily double the expenses; is the one a necessary consequence of the other?—I think that those who are employed at present in the Zoological department of the British Museum are amply remunerated for their labours, and that possibly arrangements might be made, with reference to the whole staff employed throughout that vast establishment, which would diminish the expense incurred by the additional assistants required in the Zoological department.

274. You have heard it thrown out, as an excuse for the want of good arrangement in the Museum, that there is a great want of proper space; supposing, in the last 12 years, it should appear that nearly 300,000*l.* had been spent upon the buildings of the Museum, do you or do you not think that sum ought to have afforded more accommodation than now exists?—The question which has been proposed would require an investigation into the extent of accommodation required for the collections of various kinds; the collections relating to antiquities, to the fine arts, to the libraries, to the Mineralogical department, as well as to the Zoological, before it could be properly seen how much additional space could have been afforded for the zoological part alone out of the new buildings, obtained by that sum of money.

275. You are aware that the buildings are very far from complete?—I am aware that the building is at present in progress.

276. Sir *R. Inglis.*] The collections of zoology are at present almost entirely in the old building; have you reason to suppose that there will not be provided for

them accommodation in the building either partly finished, or hereafter to be erected?— I have seen the part of the new building which, I understand, is designed to be alone appropriated to the zoological collection of the British Museum; and I consider that, although it may accommodate the present zoological collections better than they are at present, the space there afforded is quite inadequate to the growing extent of the collections, and quite insufficient to allow of the due exhibition of the specimens and collections which, I have no doubt, will pour in upon the Museum from all parts of the globe.

277. Assuming that the north front of the buildings now in progress was appropriated, in the upper division, to the collections of zoology, can you state whether such an extent, amounting to something about 350 feet in length, be or be not equal to the probable demands of the existing collection? —In my answer to the last question, I referred to the more advantageous accommodation which would be afforded in the new building for the exhibition of the present zoological collections compared with that which they now have. But with relation to the extent of surface required for the entire and advantageous exhibition of the whole of the present zoological collections of the British Museum, and to allow ample space also for the exhibition of the specimens required to supply the immense deficiencies in the collection of the British Museum, I think the single upper floor of the buildings not at all sufficient that is designed to be appropriated to the zoological collection.

278. Comparing the collection of birds in the Museum with the collection in Paris, what is the comparative rank of the two?—The collection of birds preserved at Paris is a *general collection* of that class, and as such it appears to me more numerous and complete than the *general collection* preserved in the British Museum, especially with relation to the number of species comprehended under the different genera; for example, in the humming birds, the strutheous birds, the birds of paradise; but as the British Museum has besides a distinct *collection of British birds* spread over a large space, the whole of the two collections taken together appear to me more nearly to equal, in the number of specimens, the single general collection of that class preserved at Paris. With relation to the actual number of specimens preserved in the two collections, I could not venture to state exactly the relation of the one collection to the other, never having seen an authenticated list of either.

279. Can you favour the Committee with any opinion as to the relative value of any other two divisions of Natural History in the British Museum and in Paris, for example Entomology?—The number of specimens in the entomological collection exhibited to the public at Paris infinitely exceeds that which is exhibited to the public in the British Museum.

280. Can you state what proportion the entire collection preserved in the British Museum bears to the entire collection preserved in Paris, regard being had to the fact that the British Museum collection is understood to be open in all its parts to the inquiries of men of science, though not in all its parts exposed to public view?—I have not had occasion to consult the private entomological collection preserved from public view in the Museum at Paris, so that I would not venture, from personal observation, to make the comparison in that class of animals which the question requires; but that of the British Museum, which I have inspected, is in a very imperfect state both with regard to number and arrangement.

281. Mr. *Elphinstone.*] Do you think that, without injury to the specimens in the British Museum, a larger number might be exposed to public view than there is at present?—I think that the collection of insects at present exhibited in the British Museum must be very unsatisfactory, from its limited extent, both to the public and to the naturalist.

282. Sir *Robert Inglis.*] When you say unsatisfactory to the naturalist, are the Committee to understand that, within your own knowledge or belief, any naturalist, desirous of consulting the collections as a man of science would consult them, has failed to obtain such facility in the British Museum?—The question referred, as I understood it, to the insects at present exhibited to the public, and did not refer to the contents of the cabinets preserved in private apartments in the library of the Museum.

283. Are you aware that there has ever been any difficulty experienced by any man of science in consulting the collections in such cabinets?—I am not aware that any more difficulty exists in consulting the private collections in

R. E. Grant, M. D.

15 February 1836.

the British Museum than there exists in consulting the private collections preserved in the Museums of other countries.

284. Does not the delicacy of colour in certain specimens of entomology forbid their being exposed to the action of light?—The Entomological department is so very extensive, the collections of duplicate insects preserved in the British Museum, as in most other museums, are so numerous, that without injuring the entire collection, larger selections might be made of duplicates from the various subordinate groups of that class which would afford the student, by their being constantly exhibited, means of acquiring a knowledge of that class more extensive than is at present to be found in the British Museum.

285. Are you aware that duplicate specimens are at this moment exhibited, even of those insects the delicacy of the colour of which might perhaps have forbidden the exhibition at all?—I am well aware that there is exhibited to the public at present of the whole class of insects, comprehending more than 100,000 species, only one glazed case containing a few species selected at great distances from each other throughout the orders and families of that class of animals.

286. The question referred to duplicate specimens of insects, the delicacy of the colour of which might be injured by exposure to light; are you aware of the exhibition to the public of such duplicate specimens in the British Museum?—I understand the case of insects, to which I referred in my last answer, to contain only the duplicates of the more common species of insects preserved from light in the cabinets; and I have no doubt that those common duplicates which have thus been selected, and placed for public inspection, in that case, will suffer from exposure to light. But in order to make the collection of insects conducive to public instruction and gratification, like the collection of birds and the collection of shells, which also present delicate colours that are perishable, the public exhibition of some collection is a necessary evil to be incurred for the public good; and that evil is not great where the specimens, however delicate, that are exhibited are only duplicates of a collection carefully preserved in closed cabinets.

287. Mr. *Elphinstone.*] Can you give the Committee any idea as to what proportion of insects, in a large collection, might be exhibited without seriously injuring the remainder of the finer specimens?—I should think that there are exhibited, in the Museum of Natural History in the Jardin des Plantes, to the public view, six or seven times the number that are exhibited in the British Museum.

288. Sir *Robert Inglis.*] You mean in the Upper Gallery in the Jardin des Plantes?—Yes.

289. Can you state the number of specimens in the collection at Paris exhibited, or non-exhibited?—I have not counted either those exhibited at Paris, or those exhibited in the British Museum, though I have often perused both collections.

290. Is there any catalogue of the collection in Paris?—I am not aware that there is any catalogue published of the collection of Paris. The works published by the heads of the several zoological departments at Paris always refer more especially to the specimens immediately under their charge.

291. Mr. *Hawes.*] And therefore there is less need for an accurate descriptive catalogue, in reference to the collection at Paris, than exists for a catalogue of the collection of the Museum?—In fact, the works of the several heads of the departments at Paris are more valuable, as zoological catalogues, than catalogues exclusively drawn up with relation merely to the collections under their charge, because their works refer to the specimens that exist in all the collections with which they have been acquainted at the time of the publication of their works.

292. Sir *Robert Inglis.*] Are you aware of the number of specimens in the British collection in the Museum?—I am not aware that any one has counted the number of specimens in the British collections of the Museum.

293. Mr. *Hawes.*] Has any statement of their number been made?—I have not seen any announcement of the exact number of specimens.

294. There is no authentic statement, that you are aware of, proceeding from the Museum?—None, that I am aware of; but I observe that the published Report of this Committee gives the entire number of zoological specimens in the Paris Museum as 152,000.

35

295. You are aware that the Natural History department in the British Museum is placed under one head; would it not be desirable that it should be subdivided, and that the head of each department should be independent, and responsible for the preservation and the exhibition of the department entrusted to him?—Undoubtedly, I do consider that it would be greatly for the benefit of the collections in the British Museum, as well as highly advantageous to the public, to have that division of labour established in the zoological staff of the British Museum which is established with so much advantage in that of Paris.

296. Under how many professors are the departments of Natural History placed into which the Museum at Paris is divided?—To one professor is intrusted the division comprehending the mammalia and the birds. To another professor is intrusted that of the fishes and reptiles; to another professor the molluscous division of the animal kingdom and the radiata; to another the articulated classes of animals; and to the fifth, the collection of comparative anatomy.

297. And at present are not those departments all headed by some of the most distinguished men in Europe?—Most if not all of them are headed by the most distinguished men of Europe in their several departments.

298. The professors are from time to time elected by themselves, are they not?—I rather think that the election is made by the Academy, and merely the proposal by themselves.

299. Mr. *Elphinstone.*] Are you aware that the Royal Museums in France are placed under the direction of the Intendant-general of the Civil List?—I have understood from the published Report of this Committee, that the superintendence of the Royal Collections is so placed.

300. Are you aware that the Museum of Natural History is placed under the direction of the Minister of Public Instruction?—I believe that the general control of that museum is placed under his direction.

301. Are you aware that the regulation under which the Museum of Natural History is constituted was promulgated in June 1793?—I was not aware of the precise date.

302. Sir *Robert Inglis.*] Do you know by whom the professors in the French Jardin des Plantes are named?—It is my impression that the professors in the Jardin des Plantes name a person to the Institute, who may either adopt him or not; they select by ballot a person to recommend to the Government to be appointed, but that it first originates with the professors, who name certain candidates; then the election of one of these candidates is made by ballot in the Institute, and from that tribunal the candidate is recommended to the Government.

303. Leaving a veto on the part of the Institute in the first instance, and a veto on the part of the Government in the last instance?—I believe that there is a veto in both cases.

304. Mr. *Hawes.*] The institution of the Jardin des Plantes, however, is more immediately under the direction of scientific men?—The whole management, so far as science is concerned, in the Jardin des Plantes, I understand to be entirely under the direction of the professors, who are the most scientific men in Europe in their several departments. They appoint annually one of their own body as general director of the whole for that year.

305. Mr. *Elphinstone.*] Without entering into the question of who appoints the professors, is not the whole management and regulation of the Jardin des Plantes under the direction of 13 professors?—So far as science is concerned, I believe it is entirely under the direction of those 13 professors.

306. Mr. *Hawes.*] Have not the results to science been more important and more distinguished, from the Institution of the Jardin des Plantes than from that of the British Museum?—That liberal arrangement has undoubtedly proved most beneficial to science, and I should think it is an arrangement the most calculated to stimulate the exertions of men of science in their several departments. It is infinitely more wise than to have the scientific staff, as it is in the British Museum, placed in subordination to each other, and in subordination to men whose pursuits have no relation to their own. And the effect of that liberal system is shown in the persevering industry, and the success, with which they have laboured for so long a period in the cultivation of their several departments.

307. Are you at all acquainted with the constitution of the British Museum?—I am

R. E. Grant, M. D.

25 February 1836.

—I am partly acquainted with it from the published Reports of this Committee.

308. You are aware that the Board of Trustees has the power of electing certain persons to the office of Trustee?—Yes, I am aware of the mixed constitution of the Board of Management of the British Museum.

309. Can you state whether the more eminent or learned and scientific men at all look forward to the honour of being appointed Trustees of the Museum? —I should think from the observation of the past, that very few scientific men in Britain would ever look forward to an appointment of that nature.

310. Do you think it would be an advantage to the Museum if occasionally more learned and eminent men were selected for that honour?—If it could be made distinctly an honour to scientific men to be appointed to the trusteeship of the British Museum, I have no doubt it would be eagerly looked for by scientific men, and that their appointment would benefit the Museum.

311. Do not you think that their influence might be beneficial, and that the classification and the general utility, as well as the scientific utility of the Museum, might be increased if scientific men had more influence in the Board of Management?—I have no doubt that the deliberations of the Trustees in the management of that vast Institution would be greatly aided by the counsels of men of science, especially of such as were eminent in those departments of science most immediately connected with the affairs of that Institution.

312. Are you at all aware of the comparative numbers of men of science among the Trustees now, and at the formation of the British Museum?—I have never heard of the election of a man of science to the trusteeship of the British Museum.

313. Your attention is requested to the following passage from a work recently published by Dr. Davy, the brother of Sir Humphrey Davy, which states the opinions of Sir Humphrey Davy himself, who was an official Trustee of the Museum: "When the British Museum was first established, in consequence of the bequest of Sir Hans Sloane, President of the Royal Society, of his splendid collections to the country, the Trustees were either great officers of state, owing their situation to their office, or some persons of science, art and letters associated with them, elected by the principal Trustees. At first the leading Trustees of the elected class were either distinguished members of the Royal Society, or highly accomplished noblemen and gentlemen, possessed of refined knowledge in art, or profound knowledge in science. The last scientific Trustee elected was Mr. Henry Cavendish. Lately the elections have been almost entirely made from branches of the aristocracy, or gentlemen of some Parliamentary influence. The Archbishop of Canterbury, the Lord Chancellor and The Speaker of the House of Commons are considered as the really active members of the trust, and overpowered as those great officers must be with the religious, legal and legislative affairs of the country, it cannot be supposed that they can have much leisure or much opportunity to attend to the government or arrangement of the national collections. All the officers of the Museum, who ought to be either efficient librarians or curators of the house, used to be elected in turns by the Archbishop of Canterbury and The Speaker of the House of Commons; for the late Chancellor Lord Eldon always refused to act as Trustee, considering, probably with great propriety, that he had other duties more essential to his office to perform. It is not therefore to be wondered at, that amongst the curators, assistant librarians and sub-librarians, there should be found many persons taken from the inferior departments of the church and of the public offices, places abounding with respectable well-educated men, but not the natural seminaries of either naturalists or of persons of profound and refined taste in antiquities, collections of the works of art, and monuments of the genius of the great people of antiquity. If men of the highest distinction as to scientific character had always occupied the most exalted offices in the Museum, either as curators of the collections, or as zoologists, ornithologists, entomologists, mineralogists, botanists, and superintendents of the ancient collections of sculpture and painting, and if the salaries of such officers had been made respectable, and their rank a gratifying or enviable one, there would have been always a sufficient number of aspirants after such situations, and we should not have required the assistance of foreigners in that establishment, which ought to be the natural school of our academies in science and art." Will you state your opinion on the passage which has just been read?

—I perfectly

37

—I perfectly concur with Sir Humphrey Davy in the sentiments which are there expressed; and I also concur with him in the belief that such an arrangement as he alludes to, would be highly conducive to the general interests of science in Great Britain, and there might then be an encouragement to men of science to aspire to such an honour.

R. E. Grant, M. D.

25 February 1836.

314. Sir Humphrey Davy goes on to say, "There must be a general system of change in everything belonging to this Institution before there can be any system of radical improvement. Each department must be preserved separate and distinct from the other. The sculpture must be judged by men who have shown their knowledge of taste with regard to this branch of the fine arts. The collection and arrangement of paintings must be trusted either to artists themselves or to refined judges of the art. The geologist should have his department entirely to himself, and the mineralogist would not find even the present treasures of the British Museum too extensive for much active labour, philosophical research, and even useful discovery in the variety of their arrangements and bearings; and a good geologist, by connecting the history of the specimens of inorganic nature with those of living animals, might open to the world a number of curious and very extraordinary truths." What is your opinion upon that passage?—I also concur in the sentiments which Sir Humphrey Davy has expressed in that extract; and I would be inclined to carry the subdivision of labour to a much greater extent throughout the collections of the British Museum than Sir Humphrey Davy appears to have contemplated in the passage just read.

315. There is one other passage on which your opinion is also requested, Sir Humphrey Davy also continues thus: "It appears to me that the present is the best moment for attempting a radical and fundamental change in everything belonging to this ancient misapplied, and I may almost say useless institution. In every part of the metropolis, people are crying out for knowledge; they are searching for her even in corners and bye-ways, and such is their desire for her, that they are disposed to seize her by illegitimate means, if they cannot obtain her by fair and just ones. This then is the moment to give energy to their efforts, and for the legislature to sanction what reason has so long required." Do you concur in that opinion?—With regard to that extract, I should say that I believe that corruption generally enters first, and reform last, into scientific institutions; and there is, perhaps, no institution in the British dominions where a thorough reform would be more beneficial to the public and to science than the British Museum; and although the sentiments of indignation are expressed in very strong language in that work of Sir Humphrey Davy, I fully concur with him in the spirit of the remarks contained in the quotation that has been read. I conceive that, as compared with the corresponding institution of our Continental brethren, the zoological collection of our National Museum, and the management of that collection, and the whole management of the British Museum, are an opprobrium to the British nation and these enlightened times.

316. The government of the British Museum being principally in the hands of the three principal Trustees, the Archbishop of Canterbury, the Lord Chancellor and The Speaker of the House of Commons, should it happen that two out of these three principal Trustees should decline to act, by reason of their official duties being overwhelmingly great, does it not necessarily follow that the principal government of the Museum would fall into the hands of one of them?—It appears to me to be almost a necessary result of the present constitution of the Board of Trustees of the British Museum.

317. That being the case, must not that one principal Trustee, from his being also a person overwhelmed with great official business, necessarily delegate his power and his duty to inferior officers?—It might be expected from the circumstances that have been mentioned, that very often parts of his duty would be delegated to persons inferior to him in the management of the Museum. I have had occasion also, while I was a pupil of Dr. Metoxa, professor of comparative anatomy in the University of La Sapienza at Rome, to observe the little regard sometimes paid to the interests of physical science by gentlemen engaged with clerical avocations.

318. Do you think it desirable that the head of the church in 1836, at a time when church affairs necessarily occupy even ordinary minds, should mainly direct the government and management of a great institution like the British Museum?—

R. E. Grant, M.D.

25 February 1836.

Museum?—I think that however gifted a man of that character might be with knowledge and every good principle that could adorn the human heart, that he could not have all the qualifications that are required for the due and effective management of so vast an establishment as that of the British Museum, which embraces such a diversity of objects.

319. Would not such a constitution account for the want of good arrangement and good classification, the want of good catalogues and the absence of the association of distinguished scientific men with the Board of Trustees, which have been alluded to in the course of the examination to-day?—There are many other circumstances besides those which have been more especially referred to, which may have given rise to those defects in the subordinate details of the Museum, such as the degraded nominal rank of the useful scientific officers, and the relations of subordination of these officers to each other, to whom the chief scientific trusts are confided, and upon whom a great deal of the important management of the Museum must devolve, as well as the want of competent and effective scientific heads in the body of Trustees to direct the proper organization of the whole establishment, and to enter into all the minutiæ of details which that Institution embraces.

320. Without going so far or being so strong a radical reformer as Sir Humphrey Davy appears to have been in the passage which has just been read, might not some such constitution as this be adopted with advantage, namely, placing the executive of the Museum in the hands of a board of officers in all respects equal and similar, selecting a president according to the French law, and confining the Trustees to their duties as Trustees strictly such?—I conceive that all that relates to the scientific details, as the arrangement and distribution of the objects contained in the British Museum, and the appropriation of the funds which may be confided to each head of a department by Government for the maintenance of the collections under his immediate superintendence, might be left to such a scientific body. A board so constituted would, I think, be the best calculated to employ such a power with advantage, but in other matters such a corporation should be under the supervision of higher authorities, as at Paris.

321. Supposing then such a board to be constituted, would any injury accrue to science if the Trustees were merely confined even to seeing that the Museum was regularly repaired and painted and the rooms were well swept?—I think that a body of Trustees high in rank, and men of high occupations in the state, would never allow themselves to be occupied with such menial matters, but I think that some such body might exist with advantage to the Institution, to superintend generally the administration of justice and the preservation of harmony in the interior of the Museum, and that there might be a convenient board of appeal between the members of the British Museum and the Government. I should expect the deliberations of such men to be guided with great impartiality, if not skill, and that they would decide with judgment such questions as might then come before them.

322. Do you think that the history of the Museum, in reference to the patronage exercised by the Trustees, tends to confirm your opinion of the perfect impartiality and lofty views of such exalted individuals?—I believe that the history of the British Museum does not show that the duties of the Trustees have been so circumscribed as has now been suggested, and that in the appointments of the officers in the British Museum, they have not always exercised their judgment in selecting the most eminent scientific men in the British dominions for the several departments; indeed the degraded rank of the several offices rendered such a selection impossible, in filling up the vacant offices, or in making new appointments in the Museum.

323. The following is a list of the present elected Trustees of the Museum: Lord St. Helens, the Earl of Harrowby, Lord Farnborough, the Earl of Aberdeen, the Duke of Rutland, the Marquis Camden, the Marquis of Lansdowne, Lord Ashburton, the Right honourable Thomas Grenville, Earl of Eldon, Right honourable Sir Robert Peel, the Duke of Hamilton, Earl of Derby, Lord Fitzgerald, and Sir Robert H. Inglis. Do you think, in reference to science and literature, or knowledge generally, that that selection is the best which could be made with reference to the government of the Institution?—As elected Trustees, with reference to the due administration of a great scientific establishment, I should not think, from any knowledge

39

ledge that I have ever obtained of the scientific acquirements of those noblemen and gentlemen, that they were the most competent men in Britain to regulate the scientific affairs of such an Institution.

R. E. Grant, M. D.

25 February 1836.

324. The Committee has been informed, that the office of elected Trustee has always been considered in the literary and scientific world as the blue ribbon of literature; will you state on what man of distinction in science the honour has ever been conferred within your time?—If I am not mistaken, I have stated in my answer to a former question, that it was not within the compass of my knowledge that any man eminent in science had been appointed to the trusteeship of the British Museum.

325. Will you refer to Question 142 in the evidence before the Committee of last year, and upon reading over the names of eminent individuals contained in the question, do not you think that one of those names might have even done honour to the Board of Trustees, exalted as it may now be by its rank, such as Dalton, Ivory, Brown, Hatchett, Pond, Herschell, Babbage, Henry, Barlow, South, Faraday, Murdoch and Christie?—Some of the gentlemen enumerated in this list are, I regret to say, unknown to me as men eminent in science, from our pursuits, perhaps, being of so different a nature; but there are names in this list which I should have thought would have reflected the highest honour on any Board which had the superintendence of an institution which was a temple of science, as the British Museum ought to be. I conceive that most of the scientific men in that list would have been highly beneficial as members of the body of Trustees, and that their talents and acquirements would have often aided and directed the scientific deliberations of that body.

Jovis, 3° die Martii, 1836.

MEMBERS PRESENT.

Mr. Estcourt.	Mr. Thorneley.
Mr. Hawes.	Mr. Elphinstone.
Sir R. Inglis.	Lord Sandon.
Lord Stanley.	Mr. Baring.

MR. ESTCOURT, IN THE CHAIR.

Thomas Bell, Esq., called in; and Examined.

Thomas Bell, Esq.

3 March 1836.

326. Mr. *Hawes.*] YOU are a Surgeon and a Fellow of the Royal Society?—I am.

327. You are also lecturer on comparative anatomy at Guy's Hospital?—I am.

328. For some time have you attended generally to natural history, and more particularly to particular branches of it?—For many years.

329. Are you at all acquainted generally with the Natural History department of the British Museum?—Of late years but little. I have occasionally had opportunities of examining different departments, but I cannot say that I am much acquainted with the general arrangement of the Museum; the departments in which I have been principally interested are the reptilia and the crustacea.

330. Confining the question at present to those two branches of Natural History, will you state to the Committee your opinion of the collections in the Museum, both with reference to their classification and their nomenclature?—With regard to the reptilia, some years since I had occasion repeatedly to consult the collection in the British Museum. As I consulted them for scientific objects only, I had recourse to the gentleman who, I believe, had the charge particularly of that portion of the collection, Mr. Gray, and I always found the greatest possible facilities afforded me for the most minute examination of all the specimens that I could possibly want; and perhaps it may not be irrelevant if I add, that whenever I have gone to the British Museum for the only purpose for which I ever do go, that of examining specimens for scientific objects, I have always experienced the greatest attention on the part of the scientific officers of that establishment.

 331. With

Thomas Bell, Esq.

3 March 1836.

331. With reference to the state of the collections, more particularly the reptilia and the crustacea, will you state your opinion, considering always that they are a portion of a national collection?—I have had an opportunity very lately of comparing the state of the reptilia now, with its condition some years since, and I have not, as it happens, visited it in the interval. I should say, therefore, that although the collection of reptilia is far from being now in the state in which it ought to be, as forming part of a national collection, its improvement is so considerable with regard to nomenclature and arrangement as to afford a promise, supposing that the same progress of improvement were now going on, of its being brought into a much more creditable and proper condition in the course of similar changes. I beg to say particularly that the nomenclature of the reptilia is, generally speaking, admirable.

332. And the state and condition of the specimens in good order?—All the specimens in spirits appear to be in good order. I cannot say that that is the case with many of the dry specimens, but it is impossible that they should be, after a lapse of years, in as good order as those preserved in spirits, and I speak, especially on this point, with some confidence, as I have a very extensive collection of reptilia of my own, in which I find that it is almost impossible to keep the dry specimens in good condition.

333. Is the collection as complete as it ought to be, or as it might be?—No, it certainly is not. I think that if greater liberality were allowed in the purchase of specimens in this branch, as well as in every other of zoology that I have ever attended to in the Museum, great improvement might be made; and I speak at this moment particularly of one group of the reptilia, the tortoises, in which, though much has been done, very much still remains to be done. My impression is, that the collection of tortoises in the Museum is not half equal to my own private collection, in point of species; and I think Mr. Gray will bear me out in that statement.

334. You have stated that the nomenclature of the reptilia generally is very good?—Yes; particularly the nomenclature of the specimens in spirits. At the same time I must say that very little has yet been done in naming the dry preparations, both of the saurian reptiles and of the tortoises.

335. In the class reptilia, are they all named?—No; very few of the dry specimens.

336. What is the system of nomenclature that has been adopted?—Mr. Gray has adopted his own arrangement, for the labels are in his own handwriting; and it is but fair to state, that, I believe he understands the subject of reptilia better perhaps than any other man in Europe.

337. Do you think, in a collection like that of the Museum, that any portion of the specimens ought to be unnamed?—No, I think they all ought to be named.

338. To what would you attribute such an imperfection in the collection as the want of its being named throughout?—Not certainly to the want of activity and industry on the part of the officers; but in a great measure to this circumstance, which I have often witnessed with very great concern, that the principal zoological officers of the British Museum, at a time when they ought to be, from their duty to the public, and would be, from their own inclination, attending to the scientific objects for which they are placed there, are called away in the midst of their labours to attend parties of ladies and gentlemen round the Museum; an office which appears to me as derogatory to their character as scientific men and officers of a National Museum as it is injurious to the state of the Museum itself.

339. Are you prepared to state to the Committee that the officers generally consider it a duty imposed upon them by the Trustees to do so?—No; I have no opportunity of judging. I merely state the fact from having witnessed it myself when I have been in the Museum.

340. Can you inform the Committee whether any of the officers have complained of its being a serious interruption to their scientific pursuits?—I do not recollect any particular occasion, but my impression is, that that has been complained of.

341. Then you think that the system of nomenclature and classification, in reference to the class of reptilia, is creditable to the officer who is responsible for it, and one which you are not inclined as a scientific man to find fault with?—I should

—I should not have found considerable fault with it, except that, as I before observed, I think in the dried specimens it is sadly deficient.

342. Do you think it advisable that a system of nomenclature or of classification should be adopted on the authority of a single individual?—That brings me to a point upon which I was very anxious to make a few observations to the Committee. I think it is desirable in all cases, wherever a description has been given of a species from any individual specimen, in whatever collection, that the original name should be retained to that specimen, whatever alterations may afterwards take place; and that if in the course of improvement it is found necessary to alter the generic name of such a species, still the original name by which it was first described should be always retained affixed to that specimen. Whether that is the case with regard to the reptilia I am not at the present moment certain, but I believe not. I know that it is the case with regard to many of the crustacea, if not all, which have been described from specimens in the Museum.

343. Have any of the specimens in either of those two classes, more particularly in reference to the class reptilia, names which are not to be found in any published scientific work?—I am not at present able to answer that question. I know that many of those names which are given to reptilia in the British Museum which have been most lately added, are to be found in the published works, and especially in the papers of Mr. Gray himself, which papers are considered as authority on the Continent as well as by the naturalists of this country.

344. Have you looked at all into the Synopsis of the Museum?—Some time since; I think not for the last twelve months or two years.

345. If an officer of the Museum had the power of naming specimens according to his own fancy, should not the names be specially indicated in the Synopsis, so that the scientific men who visit the Museum may be put upon their guard?—If it were a scientific catalogue of the contents of the British Museum (a matter of the greatest possible consequence), then that would be absolutely essential: but as the Synopsis is little more than a popular indication to those who generally go to the Museum for amusement, it matters very little whether the last scientific name be or be not applied to the specimen. If I may be allowed to revert to the importance of stating the original name by which the specimen has been described as a species, I would illustrate it by mentioning that Dr. Beck, the royal naturalist of Copenhagen, has lately been in this country for a considerable period, and has now gone to different parts of the Continent; and he assures me that his principal object in making this scientific tour is to examine the identical specimens which have been described as species, in different publications. Much importance does he attach to this point; and it was always a great disappointment to him, when he visited any known collection, not to find the identical specimen named with the same name as that by which it was first published. Dr. Milne Edwards, who certainly has attended to the subject of the crustacea more than perhaps any other person in Europe at the present day, and who has published by far the best book upon the subject, told me when he was in England last that it was a very great treat to him to look over the collection of crustacea in the British Museum, because he found that those specimens which have been described by Dr. Leach still retained the name which Dr. Leach had given to them, appended to the specimens so described.

346. With regard to the class crustacea, do you think that the system of classification and nomenclature in the Museum is satisfactory?—The crustacea in the Museum are arranged in three separate parts: there is the general collection which is exposed to view; there is the general collection which is contained in drawers; and there is the British collection, also contained in drawers. The collection which is exposed to view contains a great number of very valuable specimens, which are either not named at all, or named only by a nomenclature which is now obsolete; and in the few instances in which the modern generic terms are placed in the cases, they are thrown in in an irregular manner.

347. These imperfections you account for, from the officers generally not having the whole of their time sufficiently at their disposal for the general purposes of the Museum?—I presume that that is in a great measure the cause; and I judge so, because whenever I have had occasion to speak to any of the

Thomas Bell, Esq.

3 March 1836.

zoological officers of the Museum, I have always found them at work, unless they were so called away. When I say at work, I mean labouring at their legitimate objects.

348. In this class, are the names of highly distinguished writers on zoological subjects, or the names of Dr. Leach, or the popular as well as the scientific names, appended to the specimens?—In that portion of the collection which is exposed, I observed that the popular names are very generally placed with either Linnæan names or the names of old writers; but in very few instances are the names placed that are now generally received by zoologists. It is necessary to say, that the class crustacea has undergone very great improvements, perhaps as great as any other class in the animal kingdom; and that those improvements have not been kept up within that portion of the collection which is exposed to view.

349. You have stated that there are many specimens in drawers?—There are two distinct collections in drawers; one, the general collection, and the other the British collection. They remain in nearly the same condition in which they were left by Dr. Leach. The British collection is one of the most perfect I have ever seen in any department of zoology. Its arrangement is exceedingly good; its nomenclature the best that existed before some very recent publications, that of Dr. Leach himself, who has always been considered as a great authority in the class crustacea. All Dr. Leach's names have been retained in the British drawers; and I believe also, without exception, in the drawers containing the general collection.

350. Is it expedient that the collections should be retained in drawers, or is it from necessity that that plan is adopted in the collection?—The crustacea would bear being exposed better than insects; but there are many, even of the former, that could not be exposed without danger of injury from the action of light; at the same time colour is of less consequence than in insects. I imagine that the greater part of the collection may be exposed without material injury; at the same time, it appears to me the better plan to expose duplicate specimens only.

351. Then are the Committee to infer that you think it is desirable that there should be a collection of duplicates of certain specimens, either for inspection or for popular instruction?—It is highly desirable in all those cases where exposure would injure the specimens, that only duplicates should be exposed. If it be desirable to expose specimens of those classes, it is desirable to have duplicates for the purpose of exposure.

352. Considering that a national collection must always be for popular instruction, as well as for the advancement of science, would it be absolutely necessary, in order to attain those objects, that there should be a certain number of duplicates possessed by the Museum?—I think it is very desirable.

353. Do you consider that in a collection of zoological specimens, speaking generally, it would be advisable that each class, order, family or tribe should have displayed in the cases the organs upon which their several divisions are founded?—I think it would be highly desirable in the exposed part of the collection.

354. Would you make that a separate collection, or would you unite it with the collection itself?—Where it is practicable, I think it would be better to unite it with the general exposed collection.

355. In looking over the names given to the various specimens, have you ever observed any that have been erroneously spelled or illegibly written, or any written in pencil?—In pencil, repeatedly; but I do not remember any that have been illegible or improperly spelled. But in pencil, and very badly written.

356. Do you think it desirable that the keeper of a collection, supposing him always to be a scientific man, should undergo the drudgery of actually writing with his own hand all the names?—Certainly not.

357. Do not you think that the body managing so important a collection ought to prevent such labour being imposed upon a scientific man?—Certainly; I think the objects of the zoological officers ought to be strictly scientific, and that they may have clerks or other persons appointed for writing and matters of that kind.

358. You were well acquainted with Dr. Leach?—Intimately.

359. Are you in possession of his valuable manuscripts?—I have a considerable portion of his manuscripts in my possession.

360. You have stated that a portion of the names given by Dr. Leach are retained?—In the crustacea all of them.

361. Does your observation lead you to know whether the names have been retained generally throughout the departments of Natural History, or more or less in one part than in another?—The department to which I attended principally while Dr. Leach was an officer of the British Museum, was conchology, especially British conchology; but I have for many years ceased to pay any considerable attention to that subject; and I confess that I have not gone over the British collection of shells of late years. At the same time I remember, in casually passing through the rooms, that I have painfully received the impression that Dr. Leach's names have been either removed entirely or altered; but my personal information upon this point amounts to nothing more than that.

362. It is stated in an article which appeared in the Edinburgh Review, that the arrangement of the British zoological collection is due mainly to Dr. Leach. This article is written in 1823. "It is about four years," says the Review, "since Dr. Leach was occupied in the Museum, and all that appears to have been done since his retirement from its duties is the restoration of some of the British birds to their old appellations." Are you able to state whether that is correct?—I am not; because it refers to subjects to which I have never attended in the British Museum.

363. What is your opinion of the expediency of each keeper of a collection having at his disposal, apart from the general library, such books as are absolutely necessary to him, either in arranging his collection, or in giving him the last and best scientific information?—I should think it must be of the greatest utility to the keepers of any museum to have all the essential works on their particular departments at hand; and I presume that that could hardly be the case, if they were obliged to take them out of the general library, because of course they would then be removed from being consulted by others who visited the library for that purpose.

364. Do you feel it of importance that each keeper of a collection should have a separate apartment, that he might pursue his speculations uninterruptedly?—It certainly would be most desirable; that is the case, I believe, in the Paris Museum.

365. Suppose the Committee should be informed that no arrangements for such a purpose are making in the new buildings, do not you think it of importance that that point should be considered?—I think it is desirable that such an arrangement should be made as speedily as possible.

366. Do you deem it of importance that the specific name, together with the English, German and French trivial names should be attached to the specimens, so that the collection might be equally useful to the foreigner as to the Englishman?—Generally speaking, the names which are given to scientific objects in the language of the country are too vague to be applied with any degree of certainty; although it may be well to apply the English trivial name to every English species, it appears to me to be of little consequence to attach foreign names. The scientific language is so universally known to all naturalists, that it can scarcely be necessary to load the label with more than the scientific and the English name.

367. Are you aware of the annual sum expended by the Museum in improving the Natural History collection?—Not at all.

368. Can you inform the Committee what sum, if annually expended, would, within a reasonable period, complete the collection?—I feel totally incompetent to give an opinion upon that subject.

369. Sir *R. Inglis*.] With respect to the specific names, is there or is there not a want of specific names in the greater part of the zoological collection?—I do not feel competent to give an opinion upon any other branches than those I have now mentioned, for I have not consulted for scientific objects any other branches in the Museum. But with regard to the reptilia, I should say that the spirit preparations are all well named; but the dry preparations are very deficient in that respect.

370. Lord *Stanley*.] It has been stated by a witness who has been examined, "that as compared with the corresponding institution of our Continental brethren, the zoological collection of our National Museum and the management of that collection, and the whole management of the British Museum, are an opprobrium to the British nation and these enlightened times." Do you conceive that

Thomas Bell, Esq.

3 March 1836.

that an observation to that extent is justified by the state of the collection, so far as you are acquainted with it?—With regard to any comparison with the Continental museums, I have no means of judging, for I never was out of England in my life; but as a positive question I should say, that that statement goes much further than I should choose to go, and certainly differs very much from my own opinion of the state of the British Museum.

371. Mr. *Hawes*.] The remark to which your attention has been drawn is founded upon a comparison of the British collection with collections abroad; are you acquainted with collections abroad?—Not at all.

372. Then that remark, as founded upon a comparison of this collection with collections abroad, stands uncontradicted by you?—Yes; I guarded my answer with that observation.

373. Is there any scientific catalogue of the specimens of the Museum existing?—There is a scientific catalogue of a portion of the specimens; there is a scientific catalogue, which I believe was formed by Dr. Leach, of the crustacea and of the insects, and I have reason to believe that that is still kept up by Mr. Samouelle. I am not aware that there is any other.

374. Has that ever been printed?—Never, I believe.

375. Is it kept up generally, do you know?—I do not know; I have only seen that part of the catalogue.

376. Are you aware that Mr. Samouelle is confined to entomology?—Entomology and the crustacea in drawers.

377. And so far as you know, there is no other scientific catalogue existing in manuscript?—I have never had occasion to inquire for any.

378. Do you think the Synopsis of the Museum a sufficient catalogue?—I think it may be sufficient for the mass of the population that go to visit the British Museum, but it is not sufficient for scientific objects.

379. Do you think it expedient in that Synopsis, in reference to the mass of the population, to inform them that salmon is digestible, that cod breaks into white flakes and is an agreeable food?—It does not strike me as necessary; trivial observations of that kind appear to be hardly called for, even in a popular catalogue of a scientific collection. I should say that there ought to be two distinct catalogues of the British Museum; the one a synoptical one, adapted for general visitors, and the other a strictly scientific one, which should contain every species in the collection.

380. Do you think that if such a catalogue were made, it would meet with general sale, both at home and abroad?—I think it is extremely probable that scarcely a scientific library would be without it, either private or public.

381. You deem it a matter of essential importance?—Of first-rate importance.

382. Do not you think it should be made an object of attention on the part of the Trustees?—I have always wished that it might be so.

383. Are you acquainted with the catalogue of the collection of the College of Surgeons?—Yes, quite well.

384. Is not that deemed an interesting catalogue?—It is highly so.

385. Can you at all state the extent of its sale or circulation?—I have not the least idea.

386. Do you know the price at which it is sold?—I do not, for a copy has been presented to me by a friend; I have not seen the whole; the only part which I have examined is that which has been done by Mr. Owen.

387. Do you know the number of specimens in the collection of the College of Surgeons?—No.

388. Do you know the time that the formation of that catalogue occupied the maker of it?—I do not know how many years, but many years.

389. Lord *Sandon*.] Do you conceive that the collections of Natural History in the British Museum are in a sufficiently perfect state to make it desirable to publish a catalogue?—I think it would be impossible in their present state to publish a perfect catalogue.

390. Do you think it desirable not to publish a catalogue till the collection is in that state not to be exposed to very frequent alterations?—I think so. It is desirable that the catalogue should be made as complete as possible, and that at certain intervals there should be an appendix published to that catalogue; and that when the appendixes became so numerous as to render it desirable, then a new catalogue should be printed, embodying the whole.

391. Lord

45

391. Lord *Stanley*.] You were asked, whether you think it should have been made an object on the part of the Trustees to have had such a catalogue formed; do you think it would have been desirable that the Trustees should have taken such a step till the collection was in such a state as to give a perfect catalogue?—Not till the collection was in such a state as to afford the means of having a very extensive and well-arranged catalogue; and I think, that in the present moveable state of some portion of the collection, that would be impossible.

392. Then the Committee are not to understand you as casting any censure upon the conduct of the Trustees, in not having had such a catalogue prepared?—I feel that I am not competent to judge of what has been done, or what could have been done, by the Trustees; but from what I see of the collection, I think the first thing would be to bring the collection into a state that would form a good basis for a catalogue.

393. Mr. *Elphinstone*.] Might it not be desirable, in printing a scientific catalogue of what there is in the Museum, to name also the objects that are wanting?—That would be very desirable. A list of *desiderata*, in fact.

394. Mr. *Hawes*.] Do you think the present state of the collections of the British Museum, keeping in mind also their extent, is such as not to call for the formation of a catalogue?—I think I am scarcely sufficiently acquainted with the greater part of the collection in the British Museum to give a decided opinion upon that subject; at the same time I think that a catalogue is of such importance, that as soon as the zoological officers of the Museum consider that it can be done with any approach to perfection, it ought to be set about.

395. As you have stated that these officers are sometimes occupied in attending parties of ladies and gentlemen, and as you have also stated that they have actually to write the names of the specimens; do you think it possible that they could devote sufficient time, and abstract themselves sufficiently from their other duties, to be able to form a catalogue?—I think it is impossible that the zoological officers of the British Museum, under existing circumstances, could form such a catalogue as the British Museum ought to have.

396. Is it not then a fair inference from what you have stated, that the Trustees, who have the management of the institution, are indifferent to the formation of a catalogue?—I do not think I am competent to answer that question.

397. If the Trustees deemed the formation of a catalogue of the essential importance which you have stated it to be, do not you think that they would have taken some steps to form a complete catalogue before this time?—If the Trustees of the Museum viewed it in the light that I do, they certainly would.

398. Lord *Stanley*.] Are you quite certain that no such steps have been taken?—I am not.

399. Mr. *Hawes*.] Do you know any man of science who has ever seen or known of the existence of such a catalogue?—I have no means of judging, for I have never asked the question; nor have I ever heard an observation made, importing that there was no progress made in forming a catalogue.

400. You being particularly acquainted with two branches of the Natural History Museum, have you ever seen or heard of such a catalogue?—The last time I visited the Museum I had occasion to consult the catalogue of the crustacea, and I found immediately what I wanted; and with regard to reptilia, I heard this morning, for the first time, that there is a catalogue of that department, and I would explain my not being aware of it before by the circumstance that when I have been at the collection, for the purpose of consulting the reptilia, I have had much better assistance than a catalogue in Mr. Gray being ready to show them to me himself. I have but once had occasion to ask for a catalogue, and in that instance it was forthcoming.

401. Fully acknowledging the industry and ability of Mr. Gray, the object of the question is to ascertain whether, if a stranger visited the Museum, he could have obtained, knowing nothing of Mr. Gray, access to that catalogue, and consequently derived the advantages from it that you did?—The catalogue which I allude to is under Mr. Samouelle's care, because it refers to crustacea; and I have no hesitation in saying that, I believe, any stranger applying to Mr. Samouelle would immediately have had the catalogue opened to him.

402. Do you think a stranger would be likely to apply to the keeper of the entomological collection respecting the catalogue of crustacea?—I think so; indeed I have no doubt of it, because I know Dr. Milne Edwards went to the British Museum for the purpose of consulting the crustacea; and he afterwards

Thomas Bell, Esq.

3 March 1836.

spoke with great pleasure of the facilities which had been afforded him in consulting the collection, and added how much pleasure it gave him to see in the catalogue Dr. Leach's names and observations, which he particularly wished to consult.

403. Is that manuscript catalogue accessible generally to men of science?—On speaking to Mr. Samouelle, I believe, immediately.

404. Are the crustacea under the care of Mr. Samouelle?—Yes, with the exception of that part which is exposed to the public, and I do not know under whose care that is placed.

405. Is the catalogue of the reptilia open generally to the public?—I do not know, because I never asked to see it myself, nor was I aware that it existed till this morning; but I heard Mr. Gray state just now that such a catalogue is in progress, as well as catalogues of other parts of the collection.

406. Are you able to inform the Committee when such catalogues were commenced?—No, for the reason I before assigned, that I never had occasion to ask for the catalogue, except with relation to a few crustacea, and then I found it forthcoming.

407. With regard to the powers and responsibilities of the keepers of departments, do you think the present subdivision of departments, without each keeper being independent of the other, and responsible for his collection, a good system?—I think it would be desirable to make the keeper of each department much more independent than he is now. The powers which are given to the keepers of the different departments in Paris, I believe, are very extensive. I do not know that it would be desirable to give them so much power here, or whether it is desirable even there. But, if I may be permitted, I will just mention a single circumstance which occurred to myself, which shows the influence possessed by the keepers of departments in the Paris collection. I am at present writing a work on the subject of tortoises. When the naturalist who has the care of that part of the collection in the Paris Museum was in England, on seeing my collection he noted how many species they had in their collection which I had not in my own; and, unasked by me, in the course of a very short time, there came over from the Paris collection a large case filled with their rarest specimens of tortoises, committed to my care, for my use, to have them figured, and to describe from them, without even a time being specified when I was to return them. Amongst them were several duplicates, of which they requested my acceptance; but the majority of them were unique specimens. I have them now in my own house, and I have never had any intimation whatever as to the time when they are expected to be returned.

408. At all events, that must indicate a very generous desire on the part of the individual or individuals who sent it to promote the general objects of science?—Highly so.

409. And almost a singular instance of generosity?—I have never met with a similar instance, nor heard of one. I do not mention it as an example to be followed, but I mention it as an instance of almost unheard-of liberality on the part of a public body.

410. Lord *Sandon*.] Are you aware whether it was done on the responsibility of the professors, or whether there was a communication with the Minister of the Interior upon the subject?—I have no means of judging, for in fact there was no statement whatever sent with them, excepting that I was given to understand by a private communication that certain duplicates were at my service. I had previously given them duplicates from my own collection, and this sort of interchange is, I believe, not uncommon with them.

411. You would not recommend that specimens should be taken from the collection of the Museum, and so lent?—No; it appears to me a stretch of liberality which is next to impossible generally.

412. And for a time the collection from which they are taken must be imperfect?—Yes; and in the present case it must be for many months, because it would take that time to figure them.

413. Mr. *Elphinstone*.] Do you know whether this exercise of liberality was on the responsibility of the curator, or on the responsibility of the board who form the committee of management?—I do not know; no intimation was conveyed to me upon that subject; it was in consequence of the curator of that department making notes of my desiderata that I received them, unasked by me.

me. I should never, of course, have thought of asking for such an indulgence.

414. Do you recollect a somewhat similar act of generosity on the part of Mr. Owen and the Zoological Society, with reference to ornithorynchus?—I cannot at this moment charge my memory with the particulars, though I have some recollection of the circumstance.

415. Mr. *Hawes.*] Can you inform the Committee whether there are any number of specimens unexhibited, that is inaccessible to the public?—At present I have no means of judging that there are any at all, because I have visited the Museum very little of late.

416. Were you in town when Cuvier visited the Museum?—Yes, I met him there.

417. Have you ever heard a complaint that certain specimens were not shown to him?—Never.

418. And in your opinion it would not be likely that the officers of the Museum would withhold from so eminent a naturalist the sight of any specimens?—I should think it impossible. I had several conversations with Cuvier; when he was here he visited me twice at my own house, and he expressed himself generally in such terms of gratification at the manner in which he had been received both at the Museum and elsewhere, that I think, if there had been any ground for such a complaint, it is impossible he could have felt as he appeared to do.

419. What is your opinion as to the expediency of allowing officers having the charge of particular collections to make private collections in the same department?—It appears to me that it would be hard to prevent them from forming any private collection. It was done to a considerable extent by Dr. Leach, but I believe he gave the whole of them ultimately to the British Museum.

420. May not the two objects of collecting specimens for the private and for the public collection conflict the one with the other?—I can conceive it barely possible that that may be the case.

421. Then, generally speaking, you do not think it expedient to forbid the keepers of collections to make similar private collections at the same time?—It strikes me that it would be almost an act of injustice to interdict them from forming a private collection.

422. In the purchase of either single specimens or collections, do you think that, before such purchases are made, the Trustees should consult the keeper of the collection under whom they are to be placed, or not?—I think it would be essential in all cases, before purchases are made, that the keeper of the collection should be consulted as to whether the collection requires such and such specimens to be added to it.

423. And also as to their value?—And also as to their value.

424. Do not you think the contrary system, of taking opinions out of the Museum without consulting the officers of the Museum in reference to such purchases, tends to lower the standing of the gentlemen employed in the Museum?—I think so.

425. Lord *Sandon.*] Cannot you conceive a case in which the opinion of persons who have paid particular attention to a particular branch of science may be still more desirable to have as to the value of the objects than that of the officers of the Museum?—I can conceive a case in which reference may with advantage be made to an individual not an officer of the Museum; but as a general rule, I think the officers of the Museum should be consulted in the first instance.

426. Sir *R. Inglis.*] And that no purchase should be made against the recommendation of an officer of the Museum, in whose charge the department may be?—I confess I should be favourable to the general principle of giving the officers of the Museum considerable latitude upon that subject.

427. Mr. *Hawes.*] And you would be disposed to consider that a previous consultation with them would be desirable?—Highly desirable.

428. Sir *R. Inglis.*] Are you aware of any instance in which such previous consultation has not been had?—Not at all.

429. Lord *Sandon.*] Has reference ever been made to yourself as to the value of specimens to be purchased for the Museum?—Yes, reference has been made

Thomas Bell, Esq.

3 March 1836.

made to me in one instance recently; it was with respect to a fossil turtle, the finest specimen of the kind, I believe, in existence.

430. Is not that just an instance of the desirableness now and then of consulting gentlemen who have paid particular attention to particular branches of study, when a purchase is in contemplation?—Yes, and I beg to add, that in that case I addressed my letter to Mr. König, the principal of that department.

431. Lord *Stanley*.] If you happened to be the head officer of that department, and you were asked should such a collection be purchased, and you answered yes, should you consider that you had given a recommendation by that answer to purchase it?—Yes.

432. Mr. *Hawes*.] Might not that general answer be founded upon the general reputation of the collection, without a particular and minute knowledge of it?—If I were asked the question whether such a collection ought to be purchased, if I wished to recommend it as strongly as I could, I should say yes, and I should understand by saying yes, that I did recommend that collection to be purchased.

433. That would be founded upon the assumption, that you were intimately acquainted with the collection?—Unless I were, I should not have said yes.

434. Lord *Stanley*.] That reference having been made to you, would you think that you were entitled, as head of the department, to complain that you had not been consulted with reference to the purchase?—Certainly not.

435. Mr. *Hawes*.] Are you aware what collection is alluded to in the preceding questions?—Not in the least.

436. You are not aware that it alluded to certain fossil remains?—I now am, but I was not aware of it, because I have avoided reading the Report of the last Session. I beg to state, though I have had the Report in my possession I have avoided reading it, as I wished to come here wholly unbiassed; and though I was in the Museum when Mr. Gray was there, Mr. Gray knows that I have not seen him; at least he did not know that I saw him; and although I spoke to Mr. Samouelle, I would not converse with him on any subject that could have reference to my examination here.

437. And perhaps you may state to the Committee also, that you have never had any communication with any member of the Committee before you came into this room to-day?—Never.

438. Might not a collection of fossil remains be in very general high repute, and desirable for the British Museum, and might not that reputation induce an officer to say that such a collection ought to be obtained?—Yes; and I should consider that a recommendation that they be obtained.

439. Are you aware that of this particular collection of fossil remains plates, with a letter-press explanation, had been previously published?—Yes, I have the plates; I saw many of them before they were taken to the Museum.

440. Are you aware that those plates indicated certain parts that had been fabricated, leaving it to be inferred that other parts not so indicated were natural?—I have been so informed; but I did not examine it with that view myself.

441. Are you aware that fossil remains are admitted generally to be repaired or added to?—Frequently.

442. But in all such cases such repairs and additions are indicated?—They ought to be so.

443. Then if the opinion which was formed on those remains was founded upon an accurate knowledge of a published work, might not the officer, upon such previous knowledge, be fully entitled to say that such a collection ought to be obtained?—Yes; but in reference to the former question, I should say that such an answer was a distinct recommendation of the purchase.

444. Founded upon an accurate description in a published work?—Whatever it may be founded upon.

445. Mr. *Elphinstone*.] In order that the public may have some guarantee that the curators are well acquainted with the leading improvements in science, would it not, in your opinion, be desirable that the curators should be occasionally obliged to give public lectures upon that branch of science to which the collection under their charge relates?—That is a subject to which I have not devoted sufficient attention to give a distinct answer. I think that there are many arguments that may be used on both sides, in favour of and against public lectures at the British Museum; and unless I had considered the subject very maturely,

maturely, it is one of so much importance that I should rather not give an answer to that question.

446. You have given your opinion that the curators should not be taken off from their legitimate occupation for the purpose of attending visitors; do not you think that they may also be taken off from their legitimate occupation in the Museum, if it should turn out that they are secretaries of learned bodies in the metropolis?—I do not see an objection to their holding office in learned bodies, provided the time which is occupied by such duties do not trench upon that which ought to be devoted to the British Museum.

447. Mr. *Hawes.*] What is your opinion of the propriety of an officer at the head of a very important branch of the Museum being also secretary to the Museum?—That is a subject upon which I have never thought.

448. Do you think any one officer should hold two appointments in the Museum, both having considerable duties attached to them?—I do not feel myself competent to give an answer to that question.

449. What is your opinion of the expediency of pressing upon the Government the giving greater facilities and assistance in extending and improving the Natural History department of the Museum through their ministers abroad, through officers employed in voyages of discovery, and through such other channels as a government like that of this country must possess?—I think, considering the British Museum in the light of a national collection, that every possible aid should be given to its extension in the way now mentioned.

450. Do not you think that the influence of the Trustees, looking at their station in society, might be very beneficially used with the Government in that respect?—An humble individual like myself can have no means of judging what the influence of the Trustees would be with the Government.

451. Are you at all acquainted with the constitution of the Museum?—I have not attended to that considerably.

452. Are you acquainted with the constitution of any museum abroad?—Not at all.

453. Do you think the constitution of the Museum at present one favourable to the encouragement of science?—I think that many considerable improvements may be made with regard to the duties and powers of the officers, with respect to which I have already given some evidence; beyond that I do not think I am competent to form an opinion.

454. Are you aware that amongst the elected Trustees about the time that the Museum was founded there was a much larger proportion of scientific men than is now to be found amongst them?—I was not aware of that.

455. Do you or do you not think it desirable that distinguished scientific men, distinguished naturalists for example, should at all times have the Trusteeship open to them as an object of ambition and reward?—I can conceive that the existence of a scientific person or two in the body of the Trustees may be of great advantage to science.

456. The Committee has been informed that it is an object of ambition on the part of scientific men the attaining the distinction of a Trusteeship of the Museum. Are you aware of any very distinguished naturalist, for instance, in your day who has attained that distinction?—No; I do not remember any instance.

457. Mr. *Elphinstone.*] Would it or would it not be desirable that each of the scientific bodies in London should have the right of naming or appointing a Trustee, such as the Royal Society, the Zoological, the Astronomical, and other learned bodies of London?—That is a subject which involves so many considerations that I do not feel myself competent to give an answer without very mature consideration.

458. Mr. *Hawes.*] Generally speaking, you think the intermixture of men of science among the Trustees would be beneficial to the Museum?—I think it cannot but be beneficial.

459. With regard to the hours of opening the Museum, and with reference to opening the Museum on great public holidays, are you prepared to offer to the Committee any opinion upon that subject?—With reference to opening the Museum in the afternoon, I mean later than four o'clock, that would be very useful, I think, for the sake of affording an opportunity to those who are engaged in professional pursuits during the day, to consult the Museum, and I will instance my own case; I am professionally engaged every day till four o'clock. It is only by forcing a holiday that I can ever visit the British Museum

Thomas Bell, Esq.

3 March 1836.

at all, and that is no very easy matter. Were it open for two or three hours in the evening, I should have an opportunity of consulting the British Museum upon all occasions, and I believe that is the case with many thousands besides myself, scientific persons as well as others.

460. When you speak of opening the Museum in the evening, would you confine the opening to the hours of daylight, or do you contemplate an exhibition by artificial light?—I imagine that if it were open during the summer months of the year by daylight, that might be sufficient, and it certainly would be a very great advantage; but I am not prepared to say that it would be desirable to open it by artificial light.

461. Are you aware that many years ago the hours of exhibition were much more extended than they now are?—I was not aware of that.

462. There is before the Committee the first printed statutes and rules relating to the inspection and conduct of the British Museum, in which there appears the following regulation: that between the months of September and April inclusive, from Monday to Friday inclusive, the Museum be open from nine o'clock in the morning to three in the afternoon, and likewise at the same hours on Tuesday, Wednesday and Thursday in May, June, July and August; but on Monday and Friday only, from four o'clock to eight in the afternoon, during those four months, except at the times above excepted. Would that extension of the hours meet your general views, and facilitate the visiting the Museum by men engaged in professional pursuits?—It appears to me that there is considerable advantage in the present regulation of having the Museum open to the public only on alternate days, because on the intermediate days the officers have an opportunity of making their arrangements, and of doing other matters to the collection in the Museum. Scientific men also have an opportunity of consulting the collections in company with the officers. I have found it myself of great value, and I believe every other person who has consulted the collections for scientific objects has found it also. But it appears to me that some arrangement might be made by which on certain evenings the Museum might be opened, not only for scientific men but for the public also during the time before mentioned.

463. You think the opening of the Museum from four to eight in the summer months would be of great benefit to the public, and also of great service to scientific men?—Yes.

464. Mr. *Elphinstone*.] Assuming that the public are only to be admitted on alternate days, would it not be desirable that they should be admitted on public festivals and holidays?—I think it would be highly desirable, provided we may not anticipate that the influx would be so great upon the holidays as to occasion inconvenience in the rooms.

465. Mr. *Hawes*.] You would, however, wish, speaking yourself as a professional man, and one engaged in investigating subjects connected with natural history, that the hours of exhibition should be extended during the hours of daylight during the summer months of the year?—Decidedly. I would instance my own case again, that I never think of devoting a single minute to objects of a scientific nature, I mean independent of my profession, till the evening. It is impossible that I ever can do so, and I believe that is the case with so many, that it would be a very desirable thing on that account always to have it open until the time mentioned, till eight o'clock.

466. Mr. *Elphinstone*.] Your answer will apply *à fortiori* to the library?—Yes, but in my own case principally to the collection.

467. Lord *Sandon*.] You would not wish the Museum to be open every day to the public indiscriminately?—I think not.

468. It would be very difficult for scientific men to derive advantage from the collections in the Museum if they were bustled about with a crowd of spectators?—It would be next to impossible. I believe every scientific man would prefer visiting the Museum upon the days on which it is not open to the public, for that reason.

469. Sir *R. Inglis*.] Do you consider such reservation decidedly essential to the beneficial use of the British Museum?—Yes, and I think alternate days is perhaps the best plan.

470. Mr. *Elphinstone*.] At present the public are not admitted exactly on alternate days, because upon the great holidays they are excluded; would not it be desirable that they should be regularly admitted upon those days?—With

reference

reference to the admission of the public, I do not feel that I am more competent than any one else to give an opinion; I merely refer to scientific objects.

471. Mr. *Hawes.*] Have you any decided opinion as to the expediency of opening the Museum to the public upon the great public holidays, for instance, during the Easter week?—No, I have not formed a decided opinion upon the subject.

472. Do any objections strike your mind against giving the public access upon those holidays?—It strikes me as possible that the rooms might be so crowded as to risk injury to the cases.

473. Do not you think that might be guarded by increasing the attendants upon those days?—It appears to me to be a matter which can only be decided by experiment.

474. Looking at the Museum as a great source both of popular amusement and of popular instruction, if that could be effected without inconvenience, do not you think it desirable?—I think it is desirable that the Museum should be open to the public as often and as long as is practicable, because I think it is almost incalculable the benefit that will accrue to the public character from having such institutions made accessible to them.

475. Lord *Sandon.*] Upon public days the rooms are perfectly crowded, are they not?—Occasionally I have been there upon public days within the last twelve months or two years, and I have been very much delighted to see the great order and regularity which has been preserved even in the rooms which are most crowded.

476. Mr. *Hawes.*] There are two other regulations from the same "Statutes and Rules," upon which your opinion is requested. One is, "That a catalogue of the respective printed books, manuscripts, and other parts of the collection, distinguished by numbers, be deposited in some one room of each department to which the same shall respectively belong, as soon as the same can be prepared; that written numbers, answering to those in the catalogues, be affixed both to the books and other parts of the collection, as far as can conveniently be done." Do you think it desirable to enforce those regulations?—I think it highly desirable, to the utmost extent. I can hardly imagine any subject of more importance, connected with the Museum now, than the formation of a most extensive and full catalogue; and I beg to state, that with regard to the crustacea and the insects, such a plan was carried into effect by Dr. Leach, and is kept up by Mr. Samouelle to the present time.

477. What is your opinion as to exacting as a condition for the appointment of certain officers, and even of certain attendants, the ability to speak certain foreign languages?—I think it highly desirable that some of the officers should be able to speak foreign languages, perhaps all the principal continental languages; but I do not think I am prepared to give an opinion as to the feasibility of exacting it as a condition upon their appointment.

478. Is there any collection of objects of comparative anatomy in the Museum?—There are a few specimens; but I have never had occasion to consult them, and therefore I do not know to what extent.

479. You are aware that there is a skeleton of the elephant exhibited there?—There is, a very fine one.

480. Do you think it expedient that any specimen should be rendered perfect, which in itself is imperfect, by the addition of parts of other specimens?—I can imagine cases in which it may be desirable, but I think it should be only under very particular circumstances.

481. Mr. *Elphinstone.*] And they should be marked as such?—Always.

482. Lord *Sandon.*] Is that so with reference to the elephant?—Yes; it is stated that the tusks were given by another individual.

483. Sir *R. Inglis.*] Could any person seeing that specimen be deceived as to the identity?—Unless he saw the notice I think he might; but the notice is as clear as it is possible to be.

484. Mr. *Elphinstone.*] Would it not be desirable, in any collection of natural history for the benefit of the public, that there should be a collection of comparative anatomy, as far as relates to the skeletons and forms of the animals?—I think that in order to render a zoological collection as perfect as possible, those parts upon which the characters of the different groups are founded should be exhibited with the animals; such as the cranium and other portions of the

Thomas Bell, Esq.

8 March 1836.

skeleton in the vertebrata, dissections of the hard parts of crustacea, insects and mollusca, and many others; but a general collection of comparative anatomy would, I think, be out of place at the British Museum; and we have so splendid a collection at the College of Surgeons, that it appears to be unnecessary also.

Mr. *Richard Owen*, called in; and Examined.

Mr. Richard Owen.

485. YOU are a surgeon?—I am.

486. You are a member of the College of Surgeons, fellow of the Royal Society, and assistant conservator of the Museum of the College of Surgeons?—Yes.

487. You have been engaged in forming a catalogue of the museum of the College of Surgeons?—I have been so engaged, but with other duties, for the last six years.

488. Can you state to the Committee the number of specimens catalogued?—There are now upwards of 8,000 specimens described in the printed catalogues of the museum of the college.

489. Will you describe the nature of that catalogue?—As the catalogues are descriptive of different departments of the collection, their nature varies according to the subject. In the Natural History department, of which one volume or part of the catalogue, viz. that relating to the invertebrate animals, has been printed, the following is the plan which has been adopted:

Each specimen has the technical or scientific name given to it which is considered to convey the most just idea of its natural affinities.

The *synonyms* of the best authorities, such as those of Cuvier and Linnæus, are added if the first name differs, and those of any other authors who may have contributed important original information respecting the species; but the easy addition of a long string of unselected synonyms is avoided, as adding unnecessarily to the bulk and expense of the volume. The vernacular name, and a reference to the best figure of the species are given. If the species is remarkable for any peculiar properties, such as luminosity, the power of giving electric shocks, a mode or degree of locomotion differing from that of its congeners, &c., then a short notice of these peculiarities is subjoined; as also of its useful or noxious qualities, and the remedies for the latter, or else a reference is made to the work wherein an account of such is to be found. With respect to the *habitat* of the species, besides the country or clime of which it is a native, other particulars are given, such as, in the case of a quadruped, whether it frequents plains, hills, forests, &c.; if a fish, whether still water or streams, and the depth at which the species commonly resides; if a molluscous or testaceous species, whether a native of land, fresh water or the ocean, the depths at which the species is found, and the nature of the bottom, &c.

Lastly, the name of the donor, if the specimen be a donation, or the museum from which it has been purchased or otherwise obtained. I take the following as an example of the mode of describing the specimens in the catalogue alluded to:

"No. 463, A. GRYLLOTALPA VULGARIS, Latr.

"*Syn. Acheta Gryllotalpa*, Fabr. *Gryllus Gryllotalpa*, Linn.

"The Mole-cricket.

"*Fig.* Panzer, Faun. Insect. Germ. fasc. 88, tab. 5.

"*Hab.* Europe: burrowing in the soil of gardens and cultivated places. When, in these situations, the young plants are observed to droop and die without any obvious cause, they may be found, on carefully removing them from the soil, to have had their roots divided. This, which is the act of the Mole-cricket, renders it a great pest to gardens; but there is some doubt whether the roots of plants constitute its food, or are only detached when they happen to obstruct its route in quest of worms or insects.

"For the means of destroying it see Nouveau Dict. d'Hist. Nat. art. Courtillière.

"*Donor*, Mr. Clift, F.R.S." p. 121.

490. Do you think there would be any difficulty in carrying such a catalogue into effect of the specimens of the British Museum?—There would be considerable difficulty.

491. Will you explain in what that difficulty would consist?—It would consist

sist in the time which would be required to gain a knowledge of all those particulars which appear to be essential in an useful catalogue of the collection. It would require considerable scientific attainments to determine the true technical name of every specimen; or, if the species had not previously been described, to give it such a description as would render it easily recognised by other scientific men out of the Museum; the other parts of the description would be difficult from the time required to gain a knowledge of the necessary particulars. And consequently, if one individual alone had to do it, as in the case of the catalogue above quoted, it would necessarily be a very long time before the publication of such a catalogue could be accomplished. But I apprehend there is no difficulty that might not be overcome by a sufficient number of individuals, properly chosen.

492. Making allowance for all those difficulties, and the expense, do you consider that such a catalogue is of essential importance to any collection professing to be a national one?—I consider that in a national collection of natural history it is quite essential; that such a catalogue constitutes, in fact, the soul of the collection.

493. The difficulties you consider as resolving themselves into the time and expense, and the competency of the individual?—I apprehend so.

494. Looking at the constitution of the Museum, and the importance of the collection, do you think those difficulties ought to stand in the way of a complete catalogue being formed and printed, both for popular use as well as for scientific purposes?—I consider that all such difficulties should be removed as soon as practicable.

495. Are you aware of the state of any of the catalogues now existing of particular collections in the Museum?—No, I am not.

496. Have you been in the habit of frequenting the Museum much?—Not much, but I have visited the Museum occasionally.

497. And you have not become acquainted with the existence of such catalogues?—I have not. I have obtained my knowledge of individual specimens, or series of specimens, about which I visited the Museum, through the gentlemen in charge of that collection.

498. There is but one opinion amongst scientific men, or amongst the public generally, that the officers of the Museum are willing at all times to compensate for the want of such a catalogue by their personal attention and superintendence?—There is, I believe, but one experience upon that subject.

499. Nevertheless, you are of opinion that a catalogue, accessible to the public, without applying to the officers, should be at all times at the command of any one who visits the Museum?—Undoubtedly, and not only accessible to visitors in manuscript, but attainable as a printed book. If I were possessed of such a catalogue of the different classes of animals in the Museum, I should then know whether the specimen I was desirous of consulting was in the Museum or not, and I should go or not accordingly; but at present, from the want of that catalogue, I go to a certain degree in doubt; and it has happened that I have not found the specimen that I wished to see, and therefore this occasions a loss of time which the possession of such a catalogue would prevent: besides, I should see that there existed many specimens which it would be desirable to study, and for which I have now to make special inquiry or search. Such a catalogue would, therefore, be to the Museum what a classed catalogue is to a library, which not only conveys to the visitor the particular information which he wants to receive, but points out to him the sources of other information of the same nature; and therefore till a museum has such a catalogue, it is not of that benefit to the public and to the scientific world that it would otherwise and ought to be. But, above all, I have suffered most loss of time and paid the greatest number of fruitless visits in the expectation of finding the Banksian Library of natural history maintained in the spirit of its formation. Nine out of ten of the recent works in zoology I have inquired for in vain; yet they were such as related to the highest and most interesting branches of that science, viz. zootomy and physiology; they were the productions of the best continental writers on those subjects, and would undoubtedly, had they appeared in the lifetime of the illustrious founder of that library, have been promptly added to it, and their existence and nature made publicly known in Dryander's excellent catalogue. And in adducing loss of individual time as one of the evils thus occasioned by the defects in the national collection, I beg to observe

Mr. *Richard Owen.*

3 March 1836.

observe that in my case that loss of time affects the improvement of another museum, the useful application of which to the advancement of science is thus retarded by the defective state of the natural history collections and library in the British Museum.

500. Are you acquainted with the Synopsis published by the Trustees?—Only by the extracts I have read in the printed evidence of this Committee.

501. Sir *R. Inglis.*] What is the extent of the catalogue of the Hunterian collection, that is to say, how many volumes, and of what shape and size?—All the volumes hitherto published are in the quarto form. They are published in parts, according to the subjects to which they relate, and are now submitted to the Committee; viz.

Part I. A catalogue of the Pathological Preparations, in spirit.

Part II. Catalogue of the Pathological Specimens, in a dry state.

Part III. Catalogue of the Human and Comparative Osteology.

Part IV. Catalogue of the Preparations of Natural History, in spirit. [This as yet includes the Invertebrata only.]

Part V. Catalogue of the Monsters and Malformations.

Part VI. Catalogue of the Vascular and Miscellaneous Preparations, in a dried state.

Part VII. Descriptive and illustrated catalogue of the Physiological Series of Comparative Anatomy.

As the subject of this catalogue is a very extensive series of preparations, and the descriptions are copious, it is published in separate volumes, of which the following have appeared:

Vol. 1. Organs of Motion and Digestion.

Vol. 2. Organs of Circulation, Respiration, &c.

Vol. 3. Nervous System and Organs of Sense.

Besides these catalogues, express memoirs or monographs are published on any specimen or series of specimens which are of more than ordinary interest; and no expense is spared to render these monographs adequate to convey to scientific men a full knowledge of the subject. Of these the "Memoir on the Pearly Nautilus" is an example; and I may observe generally, that expense has never, since I have been attached to the museum of the College of Surgeons, been allowed to weigh against the desire of the Council to render that museum as generally and extensively useful as possible.

502. How many volumes are already published?—Nine quarto volumes or parts.

503. What proportion does the collection therein described bear to the collection in the British Museum?—That I am unable to say; I am not aware of the extent of the collection in the British Museum.

504. What proportion does the portion therein described bear to the whole collection in the Hunterian Museum?—The published catalogues include a description of about two-thirds of the collection in the museum of the college.

505. The catalogue has been six years in preparation?—It has.

506. And will be completed in how many?—I apprehend in two years more.

507. Mr. *Hawes.*] How many persons have been employed in that labour?—Three individuals only. Mr. Clift has made the catalogue of the pathological preparations, both in the wet and in the dry state; Mr. William Home Clift made the catalogue of the osteological and miscellaneous collection and malformations; and the catalogues of natural history and comparative anatomy have been confided to my care. At present I am working at the catalogue of comparative anatomy, and Mr. Clift is proceeding with the catalogue of the calculi and other concretions, of which there is a large collection in the college museum.

508. Lord *Sandon.*] Was not Mr. Clift engaged upon it many years before?—Not effectively, with reference to a published catalogue, but in collecting materials during a part of the time. As, however, the care of the collection devolved almost wholly upon him, he could devote but a small part of his time to that work.

509. Sir *R. Inglis.*] What proportion of the catalogue already printed of the Hunterian Museum can be considered analogous to the catalogue which might be formed of the British Museum. In other words, what departments have

you

you in the Hunterian Museum to which they have no correspondent department in the British Museum?—They have, I believe, no departments in the collection of Natural History in the British Museum which correspond to the departments of Comparative Anatomy, Pathological Anatomy, Malformations Calculi and Concretions, or the Series of Human and Comparative Osteology in the Museum of the College. The part of our published catalogue which has, with one exception, the nearest resemblance in its plan to that which I conceive would be most useful for the natural history in the British Museum is the catalogue of the invertebrated animals in spirit. The exception to which I allude is, that it is, like the Synopsis of the British Museum, an anonymous publication. The catalogues of the natural history of the British Museum should bear the names of the responsible authors on the title-page.

510. What should you recommend as a pattern catalogue of natural history if there be one, looking at European literature generally?—There unfortunately exist but few modern works of this description. I know of none that so nearly approaches in its nature to the catalogue which should be published of the natural history in the British Museum, as the above-mentioned catalogue of the invertebrated collection in the College of Surgeons; in which, however, there are defects which will be remedied in another edition. I have seen the catalogue of the Cuvierian collection, but that is a mere numerical list or index, published since Cuvier's death.

511. How many specimens does that volume describe?—It contains descriptions of 870 specimens.

512. Can you state to the Committee how many specimens in any one department of Natural History in the British Museum would have to be described in such a catalogue as you contemplate?—I should imagine that the whole of the specimens in every department of Natural History ought to be described in that way, and that the descriptions should be published in separate volumes, as, *e. g.* a volume of the catalogue of the Entomological department, another of the department of the Crustacea, and so on, according to the classes of animals. This being consummated, a naturalist devoting himself to the study of any particular class would be enabled by these catalogues, and by the annual supplements, containing an account of all the additions in the previous year, to see at once what materials existed in the British Museum for reference, in order to study or compare with any specimens which he might happen to have in his own collection.

513. You do not know how many specimens of the Entomological department exist in the British Museum, and consequently you cannot tell the Committee what number of volumes a description of that department would require as compared with that description of 1,000 specimens forming one quarto volume in your own Hunterian Museum?—I should imagine that if the catalogue of any one class of animals were printed in moderately small type, in quarto, with that care to compress a quantity of information in a small space which is characteristic of many of the publications of the present day, such catalogue might be contained in one quarto volume.

514. Lord *Sandon.*] In your opinion is any of the different collections in Natural History in the British Museum in such a state of completeness as to make it yet desirable to go to the expense of publishing a catalogue?—The catalogue of every portion of each class of animals that is exhibited and accessible to the public, and to scientific visitors, might be so printed, without reference to the rest of the collection, which was not so exhibited; and other portions of the catalogue might appear in succession as the remainder of the collection was brought into a condition to be exhibited to the public.

515. Lord *Stanley.*] As very great increase takes place in particular classes, might not the effect be, that the catalogue, before it was a quarter finished, would require in particular places appendices?—Undoubtedly it would always require very considerable appendices and additions.

516. Is not it then desirable to postpone the formation of a catalogue until the collection is in a tolerable state of completeness?—I should say not; for as nature is inexhaustible, if the catalogue be postponed till any certain supposed degree of completeness may be obtained, the delay will be more detrimental than the incomplete state of the catalogue first printed.

517. Can you give the Committee any idea how much of the six years has been occupied by the preparation of the catalogue of 1,000 specimens of

Mr. *Richard Owen.*

3 March 1836.

natural history?—The formation of the natural history catalogue occupied one individual during one year, working at it on the average three days in the week.

518. Lord *Sandon.*] Do you conceive the zoological collection in the British Museum to be in a condition at present worthy of a catalogue?—All that part which is submitted to the public I conceive to be in a state worthy of a catalogue; all that part which a scientific man can see without reference to those gentlemen who have the charge of the collections, I conceive should immediately form the subject of a printed catalogue, that he might consult and study such part of the zoological collection without taking up the time of the officers.

519. Should you not think it sufficient, till the collections are in a greater state of completeness, to have manuscript catalogues affixed in some part of the room to a desk, which any person upon entering the Museum might consult, without reference to the officer?—That would be, to a great extent, advantageous; but it would by no means give to the scientific man the advantages which I apprehend a printed catalogue in his own possession would give him.

520. Mr. *Elphinstone.*] In printing a catalogue, would it not be desirable to mention the desiderata and wants of the collection?—They are naturally deduced from perusing such a printed catalogue, and therefore a museum derives considerable advantage by having as much as possible of its catalogue printed, however incomplete it may be supposed to be; because then a scientific man is enabled to see what the desiderata are, and he may have both the disposition and power to supply those desiderata. The printed catalogues of the museum of the College of Surgeons have had that effect to a great degree. But in reference more immediately to the question, I have to state, that a list of the desiderata of a collection is of great utility. Such a list I was directed by the board of curators of the college to prepare not long ago, of which a copy is laid before the Committee.

521. Mr. *Hawes.*] Do not you think that in proportion to the extent of a collection, a catalogue is more necessary?—Undoubtedly.

522. And that in proportion as the collection is likely to extend, it is the more necessary it should be immediately begun?—Certainly.

523. Do not you think that if a catalogue were published from time to time of parts of those collections, that it would meet with purchasers engaged in making collections similar to those of which the catalogue gave an account?—I am not able to speak of the advantages of a printed catalogue in a commercial point of view.

524. Do not you think it probable, amongst scientific men, both here and abroad, that such portions would be purchased?—I have little doubt but that they would eagerly embrace the opportunity of purchasing such a catalogue; but the extent to which it would meet with a sale would yet, perhaps, be but slight.

525. If you were to wait till the collection of Natural History were complete, would not you then, in point of fact, postpone the formation of a catalogue altogether?—Undoubtedly.

526. According to some regulations of the British Museum, that were printed by the House of Commons in 1807, it appears that under the head of Natural History a report was made to the Trustees to this effect, that a general inventory of the contents of those departments, for the purpose of the annual visitation, should be made; that a new catalogue of Sir Hans Sloane's collection, the original catalogue of 20 volumes folio being very inaccurate, should be made; that a catalogue of insects, zoophytes, lithophytes, &c. should be made; that the general mass of botanical collections should be arranged, which had been postponed by former officers. Do not you think it very desirable that those regulations should be carried into effect?—I am not aware how far the carrying those regulations into effect might interfere with the completion of such a catalogue as I have contemplated, and therefore I am unable to answer that question.

527. Those recommendations are generally for the formation of a complete catalogue; do not you think the Trustees should have enforced the making of such a catalogue, pursuant to their own officer's report?—If there were no insuperable obstacles to the pursuance of such a work, I should think so.

528. Sir *R. Inglis.*] Can you state to the Committee what is the relative rank of the collections in different departments of the British Museum as compared with

with the corresponding departments in any museum in this country, or in any other country, beginning with the Jardin des Plantes?—My acquaintance with the British Museum does not enable me to make any such comparisons; I have only a general idea of its very great magnitude and extent.

529. Mr. *Elphinstone.*] In your opinion would it be advisable to have a department of Comparative Anatomy in the British Museum?—Not as a distinct collection. The extent to which comparative anatomy might be advantageously introduced in the British Museum would be to illustrate those characters upon which the orders and divisions of classes of animals are founded. Thus at the commencement of each order of mammalia there might be preparations showing those modifications of the teeth and organs of progression, on which the characters of such orders were founded, and to that extent comparative anatomy might be introduced as a part of the zoological collection, but not to form a separate collection, whilst another public collection like that at the college is in existence.

530. Mr. *Hawes.*] Are you acquainted with any particular collection in the Museum more than another?—My acquaintance is very slight with any department; it has been the molluscous classes almost exclusively that I have had occasion to consult.

531. Is that in a complete state?—The collection of shells I have always thought to be in the most complete state, and to be most easy of access and consultation in their present arrangement.

532. Are they generally named?—I have not observed any deficiency in that respect in recent visits to the collection.

533. Is the system of nomenclature adopted generally that which is most useful?—It has struck me that it is; it has been perfectly satisfactory to my own individual wants.

534. Is the system one known and acknowledged generally, or is it one adopted by the head of the department?—I have not studied the whole collection sufficiently to be able to say according to what arrangement it is now disposed, or whether one uniform system is adopted and adhered to; but, with reference to this important subject, I beg to submit that the system of arrangement of the specimens should correspond with the *Systema Naturæ* or classification of the animal kingdom most generally adopted by zoologists; that it should accord with the principles laid down in the work that has received the sanction of the majority of naturalists throughout Europe, and which is most generally recommended to the students of the science as their best and safest guide. The new species or genera resulting from the continual accession of specimens should be intercalated with those of the adopted system to which they have the nearest affinity, but the arrangement of any part or subdivision of the collection ought not to be altered on account of such partial additions. If, however, the adopted system of arrangement be too long adhered to, the collection, I am aware, will be liable in this respect to fall behind those of other countries in its character and utility: When, therefore, it may be asked, is a change to be made? The time for the alteration of the general arrangement will, in my opinion, have arrived when a superior mind shall have surveyed the whole known system of animated beings, and shall have proposed such an harmonious disposition of the old and new subjects of classification as shall receive the sanction of the majority of men of science, and be approved as (in comparison with other systems) the truest expression of the state of zoological knowledge at the time being. In the meanwhile the student of zoology ought to derive from the national collection that advantage and aid which an arrangement of its objects according to the text-book of the day will afford; and until a curator shall have achieved such a mastery over his science as will enable him to confer the benefit of a general revision and improvement of the entire system, founded on researches as extensive and profound as those of Linnæus and Cuvier, he ought not to be at liberty to break up the arrangement of a part of the national collection, on account of some limited views of partial improvement which he may entertain; such a practice I regard as little better than making a plaything of the collection. New views, of the nature and extent just alluded to, may be submitted to the scientific world in appropriate publications; there they will effect their legitimate purposes. The specimens on which they are founded, being catalogued and numbered, may be referred to and consulted by the scientific visitor with equal advantage, whether they retain the Cuvierian

Mr. *Richard Owen.*

3 March 1836.

juxta-position or not; while the student continues to derive the assistance which an adherence to the system of the acknowledged text-book of the day affords.

Thus, supposing a national collection of zoology to have existed in the time of RAY, and that the specimens had been arranged and catalogued according to his system, I apprehend that the student of zoology would have been most benefited by an adherence to that system in reference to that collection, until the publication and general acknowledgment of the *Systema Naturæ* of LINNÆUS had taken place. Such a work, so acknowledged, justified a general change of arrangement of the national collection to correspond: and I apprehend that the appearance and reception of the *Règne Animal* of Cuvier bespoke the arrival of a period for a similar change. The system of arrangement of the national collection adopted, according to this view, may then advantageously remain until the advent of a corresponding epoch in zoological science. Had our national collections been arranged, catalogued and accessible to students in that state during the periods alluded to, we might not perhaps have had to receive from foreign authorities the improvements in the system of arrangement, due in the first instance to our immortal countryman.

535. Do you think that such a system of nomenclature might be adopted with advantage both to the man of science and to the popular visitor?—In my last answer I was speaking of the arrangement of the specimens. With respect to the nomenclature, that I apprehend ought always to be regulated by the opinion and judgment of the head of the department of Natural History; and if the synonymes, in cases of alterations, are added, then I apprehend no great inconvenience can result.

536. What is your opinion as to the completeness of the collections generally?—I have looked over the collection of mammalia, and it appears to me to be not such a collection as a National Museum should possess, for the purpose of giving the inhabitants of an enlightened country an opportunity of seeing the various modifications by which the mammiferous type of structure is adapted to different climates, soils, media of existence, kinds of food, &c.; it is not adequate to convey so extensive and complete a knowledge of this important class as a national collection of mammalia might be expected to do.

537. With reference to the general improvement of the Natural History department, are you able to suggest anything that would tend to render it more valuable and more useful?—From the experience of our own collection at the Surgeon's College, it appears to me that it would be most benefited by the curators of the different departments of Natural History having the advantage of a direct, speedy and personal communication with the governing board, in case of opportunities of making acquisitions to the collection occurring. For example, in our own museum our governing board consists of men who are well acquainted with physiology and comparative anatomy, and who have themselves advanced those sciences; and in case of any collection which it may be thought desirable to add to the museum, coming into the market or being in a condition to be purchased, we are then enabled, without reference to a non-scientific individual as a medium of communication, to go at once to those gentlemen who form our governing board, and we find that they sympathize with our wants, and aid towards their fulfilment. That the chairman, for example, of the governing board does, and has repeatedly gone with us to visit himself collections we have wished to purchase; that he has listened to our suggestions, has given suggestions of his own, and the end has generally been that we have made large and speedy additions to the museum. We are also allowed the privilege of making small purchases to a certain extent, without the delay of a meeting of the board, and in that way we are frequently enabled to acquire valuable specimens which we should otherwise have lost. And therefore I have thought that if the heads of the different departments of Natural History in the British Museum had similar facilities, they would be enabled greatly to increase the value of their respective collections.

538. Lord *Stanley.*] When you speak of the heads of the departments of Natural History, do you mean that your recommendation would be, that each of the gentlemen superintending a particular branch of the Natural History department should communicate to the Trustees, without going through the hands of the officer who is at the head of the whole department?—Exactly so.

539. You would wish that the officers at the head of the different departments should act independently, each having the care and being responsible for that department

department that he presides over?—In the particular case before alluded to, that is to say, as to the addition of specimens to their respective collections.

540. And in the formation of an estimate to be laid before Parliament, which is necessary in the case of the Museum, would you recommend that each of those gentlemen should upon his responsibility state the amount which he would require for that particular branch, so far as he can do so, for the service of the year?—Undoubtedly.

541. Will you describe what is the constitution of the governing board of the Hunterian Museum?—It now consists of five, formerly of seven members of the council of the college, and they form a board, called the Board of Curators of the Museum of the College.

542. Can you give the names of those gentlemen?—Sir Anthony Carlisle, chairman, Mr. Lawrence, Sir Benjamin Brodie, Mr. Travers, Sir Charles Bell and the President of the college for the time, who is, *ex officio*, a member of every board and committee. The functions of the Board of Curators are to see that the regulations of the council relating to the exhibition of the museum are carried into effect; to exercise a general superintendence over the affairs of the museum; to direct and advise with the conservators in all proceedings which may be deemed most conducive to the welfare and advancement of the museum, and to communicate with the Government Trustees concerning the Hunterian collection in the museum of the college. In explanation of that part of my answer referring to the Government Trustees, I beg to lay before the Committee a copy of the Terms and Conditions on which the Hunterian Museum was given to the college. (*see* Appendix.)

543. Then that which you call the governing board is an intermediate board of scientific men, between the officers immediately at the head of the department and the council that superintend the whole?—It is: as regards the officers of the museum, they constitute the governing board; and with respect to the acquisition of specimens, practically we find that having the sanction of the Board of Curators, we have the sanction of the Council.

544. But strictly speaking, they are not the governing board, inasmuch as there is a board which adopts their recommendations, but which has the power of disregarding them?—Exactly so.

545. The Hunterian Museum is much more confined in regard to the scope of its objects than the British Museum?—Yes, than the British Museum generally, including all its departments, undoubtedly.

546. In order to be useful in the position in which they are placed, it is important that this board of scientific men should be scientific men with reference to that particular branch only which they superintend?—It is so.

547. Consequently, if the same system were adopted with regard to the British Museum, you must have a large number of boards, all of them reporting to the Trustees or the governing body upon the separate departments in that Museum?—If each board had the same relation to a department of the British Museum as our Board of Curators bears to the museum of the college, it should be constituted of gentlemen conversant in that particular department of science; in which case such a board would, I apprehend, have an analogous utility, if the communication between the officers and such board, and the influence of the recommendation of the board, with respect to purchases, were the same as in the Board of Curators of the college museum.

548. What do you conceive would be the effect of a board which should be constituted, as in the case of the British Museum, of one or two persons conversant in each department, meeting for the general superintendence of the whole; do you think that such a constitution would tend to the good management of the institution, and the harmonious working of the proceedings of the governing body?—I am afraid that number would be too small; that private feelings would be more liable to affect the utility of a board of one or two, than of five or seven members.

549. What would you think of the constitution of a board which should consist of scientific representatives of the various departments; how do you think that would work?—To answer that question would require a greater knowledge both of the history and constitution of the British Museum than I possess. I have only adduced the system of government of the museum of the College of Surgeons to show how well it works, and from reading over the evidence respecting the British Museum which has been printed, it struck me

Mr. *Richard Owen.*

3 March 1836.

that the differences which seemed to exist in the relations which the heads of the different departments of the natural history collection bore to the governing board, as compared with those between the conservators of the college museum and their governing board, were likely to produce the evils that have been complained of in the British Museum, viz. the defective state of the collections, and perhaps also the defective state of the catalogues.

550. Mr. *Elphinstone.*] Do not you think that whoever may form the governing body of the British Museum, it is very desirable that there should be scientific men among them?—For the purpose of receiving the communications of the heads of the departments of Natural History, I should think it very desirable.

551. Mr. *Hawes.*] Are you at all acquainted with the constitution of the Jardin des Plantes at Paris?—I am.

552. Are you aware of the nature of the governing board there?—It consists of the professors-administrators of the establishment.

553. Can you inform the Committee whether such a board works well or not in reference to the formation of a collection of objects of natural history?—It works well in reference to the formation and increase of the collection, but in reference to the application of that collection to the wants of the public, it does not appear to work well.

554. In what respect does it fail to fulfil the wants of the public?—Because the professors-administrators have not a superior board to compel them to publish catalogues of their collection; this is to a certain degree voluntary on their part.

555. But inasmuch as the administration of that institution is immediately under the Minister of the Interior, do you conceive there is any great difference between the Minister of the Interior acting as the superintendent of the museum, and the Board of Trustees here acting as superintendents of the officers of the Museum?—Yes; I apprehend that in the latter case the details of the government of the Museum may be better attended to, and its application to the wants of the public more extensively and effectually enforced, than by a state minister.

556. Why do you conceive a state minister incompetent?—I do not know that he is incompetent; but as regards the Jardin des Plantes, such is the effect in this instance, viz. that there is no published catalogue of the collection in that establishment, which appears to me to arise from the heads of the departments of Natural History, who are also administrators, not being under the superintendence of a superior board, who might require them to devote a portion of their time to the completion of such a catalogue; the non-publication of which, however, appears to be the only instance in which the constitution of the Jardin des Plantes does not work well.

557. In other respects it works well?—Yes, and especially as regards the formation and increase of the collection.

558. The following are the divisions into which the departments of that institution are divided, which consist of 13 chairs, as they are called: Botanique, Zoologie, Géologie, Minéralogie, Reptiles et Poissons, Botanique Rurale Culture, Chimie Appliquée, Animeaux Articulés, Anatomie Comparée, Chimie Générale, Anatomie Humaine, Mollusque et Zoophytes. Are not the various pursuits of those different individuals of a perfectly distinct and separate kind?—They are to a certain extent distinct.

559. And yet that governing body as a whole works well for the collection, with one exception?—Apparently so.

560. And for the public, with that exception?—Yes.

561. Does not it hold out an encouragement to scientific men to aspire after a seat at a board of that description?—It is, I believe, the principal object of ambition among the naturalists in Paris to fill those situations.

562. And the principal naturalists do in fact fill them?—They do so.

563. Mr. *Baring.*] Would you expect such a board to afford the same facility to the public in this country?—I do not know how far it would succeed. I apprehend that as regards the increase of the collection, it might; but I do not know sufficiently the collateral circumstances to judge.

564. Do you suppose that it would be more liable to abuse than the present government of the British Museum?—Whether a governing board composed of scientific men, or as at present constituted, would be more liable to abuse, may

perhaps

perhaps depend on their respective degrees of amenability to the bar of public opinion, and the comparative extent to which they may be thereby affected or influenced.

565. Have you any knowledge of the constitution of the London University?—I have no definite or particular knowledge of it.

566. Are not men of high scientific attainments disposed to attach inordinate importance to the branch which they have themselves followed up?—It has happened so; but I should say that it was not a characteristic of the man of high scientific attainments. One who is deeply conversant with a particular branch only of science, may be likely to give undue importance to that branch; but a man of high scientific attainments would, I think, as one of the directors of a National Museum, exercise his faculty of comparison, and give to each department its fair share of his influence.

567. Does not that require a degree of freedom from the usual frailty of human nature which you cannot expect from mankind in general?—Probably; but the high scientific attainments which have been alluded to, are such as tend to elevate the individual above the frailties of the race.

568. Mr. *Hawes.*] Do you think that remark applies more to scientific men than to men of high rank?—I am unable to say.

569. Mr. *Baring.*] Do you suppose that scientific men, being prejudiced in favour of the department to which they exclusively devote themselves, would be unfit persons to regulate the distribution of the funds of such an institution among the several departments?—Individually, they would. By that, I mean to say, that any gentleman, conversant with one particular science only, would be an unfit person to regulate the disposition of the funds of an establishment requiring the care and advancement of other departments; but whether five or more gentlemen, who together include all the departments, would be so unfit, I am not prepared to say. It would appear from the case of the Jardin des Plantes, that, to a certain extent, they would not be unfit.

570. If the governing body consisted of such persons, should not you expect them each to contend for the superiority of his own peculiar object of interest, and would not thus feuds and jealousies be introduced in the management of the institution?—Not by any means to the same extent as where scientific men find the means of increasing their respective collections facilitated by previously conciliating, or acquiring the sanction or favourable disposition of an individual having authority over them, and forming an intermediate agent between them and the governing body. I also believe, that the petty jealousies alluded to would be much more liable to arise, in the case of scientific men, as heads of departments of a museum, having to apply for the means of increasing their respective collections to a governing board composed of individuals not scientific, than if the scientific men were themselves immediately responsible to the bar of public opinion for the extent and condition of the collections under their charge. But in this comparison, I assume that the scientific gentlemen forming an administrative board should fulfil the same functions as the professors-administrators at Paris do, and be public teachers of their several sciences.

571. Mr. *Hawes.*] You think the direct responsibility attaching to men of science, managing an institution like the British Museum, would be a cure for the evils which have been pointed out in the preceding question?—I am not sufficiently master of the subject to give an unqualified affirmative to that question; to a great extent, however, I think it would.

572. Mr. *Elphinstone.*] Do you consider that men of science and men of sound knowledge are more accessible to prejudice and petty jealousies than men of rank?—I am unable to say.

573. Mr. *Baring.*] Would not men of rank who have no prejudices in favour of one department or another, be entirely impartial in the distribution of the funds of the institution, or in the purchase of collections?—It would be undoubtedly so expected.

574. Lord *Stanley.*] You stated that you considered it to be desirable that the separate officers of the department of Natural History should communicate separately with the governing body; for what reason do you think that is desirable?—Because the governing body would then receive their information and hear the wants of the conservators directly, and at first hand, and I apprehend that is always more satisfactory than receiving it through another channel. And

Mr. *Richard Owen.*

3 March 1836.

again, on the supposition of a non-scientific individual being practically the medium by which the wants of the different departments of Natural History are made known to the Trustees; there may possibly exist a disinclination on his part to the expenditure of sums of money for the advancement of any scientific object: and if the heads of the Natural History departments have to contend, in any shape or degree, against that disposition, the facility of improving their collections becomes thereby much diminished. If, for example, I had to lay my case before the governing board of the college museum, through the medium of the secretary, who is not a scientfic man; say I wanted 100 *l.* to be expended for such and such specimens, I should not expect to find a corresponding willingness on his part to promote my object. Without the least disrespect to him, I should not expect that he would lay the case before the board so well or effectually as I should myself, if admitted to state and explain my case personally.

575. When you stated that you considered it desirable that the heads of the departments of Natural History should communicate directly with the Trustees, did you mean that the heads of those departments should communicate directly with them, without going through the hands of the gentleman who superintends the whole of the Natural History department; or were you under the impression that he had not the means of access to the Trustees for the purpose of making recommendations directly?—I was under the impression that, practically, the communication was not in all cases direct and personal between the head of the department of Natural History and the Trustees, in the event of requiring sums for the acquisition of specimens of natural history.

576. Then the objections which you have implied to the constitution of the body of the Trustees of the British Museum would be materially diminished if the fact were that the head of the department did communicate directly with them upon the subject of purchases?—Certainly; and still better if the heads of the sub-departments of Natural History had the same facility of direct and personal communication with the Trustees.

577. For what reason would you conceive it desirable that the heads of the sub-departments should communicate directly with the Trustees?—Because at present the collection of Natural History includes departments that are distinct in their nature; for example, those of Mineralogy, Entomology, Ornithology, &c.

578. You consider it desirable, therefore, that each of those several departments should apply similarly to an impartial body, which would attend to the wants of each without preference for either?—I do apprehend that that would very materially increase the power of the conservators to complete their several departments according to their own and the public satisfaction.

579. If among the Trustees of the British Museum it were required that one of the Trustees, for example, should be a gentleman scientifically conversant with Natural History, would not the natural effect of that be that the remaining Trustees would look mainly to his advice with reference to purchases to be made in that department?—It is probable that they would.

580. Supposing that gentleman were more immediately attached to some particular branch of Natural History, would not the same effect be produced among the Trustees themselves which you are desirous of avoiding, by giving to each separate department a communication direct with the superintending board?—I apprehend that such Trustee would be inclined to pay most attention to the wants of that department in which he was individually most interested.

581. Would not the effect also be, that the persons in the immediate charge of the separate departments would feel themselves lowered by having placed over their head a Trustee, specially to superintend the department to which they belonged, and to control them?—From experience I should say not: that there would be greater pleasure in communicating with a gentleman who had worked in the same field of science, and could sympathise with the feelings of a curator on that subject.

582. Would not you conceive that a board of men of general education and acquirements, and not particularly scientific with reference to any single department, would be more inclined to take practically the opinion of the head of each department under their superintendence, than if one of their body were qualified to advise them with regard to each particular department?—That would probably be the case; and if the curator had the opportunity in all cases of

of stating his wants without delay to such a board, or an influential member of it, then the facility of increasing the Museum would be greater.

583. You state that you consider the present constitution of the Jardin des Plantes to have been very advantageous: has not it had the effect in some cases of the officers placing their own immediate connexions, for example, their sons and sons-in-law, upon the establishment?—That has happened, and there are instances of it at present.

584. Have you ever heard any similar charge against the Trustees of the British Museum?—No.

585. Do the officers hold many other situations as well as those connected with the Museum of the Jardin des Plantes?—In many cases they have done so, and I believe still do. Of this Cuvier was an instance.

586. Mr. *Hawes.*] Will you state what you know upon that subject?—Besides his professorship at the Jardin des Plantes, Cuvier held the office of secretary to the Institute for the Academy of the Natural Sciences, and had several important offices connected with the government of the country.

587. Lord *Stanley.*] Practically, have not the professors at the Jardin des Plantes bestowed more attention upon their lectures in their several departments than upon improving the collection?—Practically, an improvement of the collection has resulted from the circumstance of the professors being obliged to give a general view of their respective sciences in public lectures: thus they have been led to feel acutely the wants of their collections, when they have found that they could not illustrate certain parts of their course, from the defective state of such or such parts of the collection; their auditors are strongly disposed to supply those deficiencies; and therefore, instead of the collections suffering from having been made subservient to the illustration of public lectures, this has had, practically, the contrary effect.

588. Can you state what has been the amount of augmentations of that collection in the course of the last 30 years?—No, I cannot; but I know that in one case, viz. the collection of comparative anatomy, that was created from the necessity in the head of that department, of giving a public course of lectures; in fact, that collection was the result of Cuvier's appointment. It appears that most of the departments of Natural History were at a similarly low ebb at that time, and that the lectures of Lamarck had an analogous effect to some extent in his departments to those of Cuvier; they had a similar effect, for example, in improving the invertebrated division of the Natural History collection.

589. But you cannot state what augmentation has been made in the last 30 years, either in the Jardin des Plantes, or in the corresponding branches of the British Museum?—I cannot exactly.

590. Mr. *Hawes.*] The reputation of the collection in the Jardin des Plantes is an European reputation, is it not?—It is.

591. Did you ever hear the collection of the British Museum spoken of as one deserving to be considered an European collection?—Yes; and I apprehend that it is so.

592. Mr. *Elphinstone.*] Would it not be better that there should be some persons among the Trustees well conversant with each branch of science, in order that they may be able to judge of the requests to increase the collections made to them by the curators?—I am not sure that that kind of knowledge is absolutely necessary to form an opinion as to the grounds upon which the curators would ask for certain sums for such a purpose.

593. The question refers not to the pecuniary value, but to the scientific value of the collection?—They would be better able to judge of the accuracy of the reports made to them upon that subject, undoubtedly.

594. Are you aware of more than one instance, in the Jardin des Plantes, where a relation of the professor has been appointed?—With respect to the appointment of relatives of the professors, I know two instances; one instance in which a son, and another in which a brother was appointed.

595. Are not those two persons men of high scientific attainments?—Undoubtedly.

Martis, 8° *die Martii*, 1836.

MEMBERS PRESENT.

Mr. T. G. B. Estcourt.	Mr. Bingham Baring.
Mr. Hawes.	Mr. Elphinstone.
Sir Philip Egerton.	Mr. Marshall.
Mr. Thorneley.	Sir Robert Inglis.
Mr. Compton.	Mr. Pease.

MR. T. G. B. ESTCOURT, IN THE CHAIR.

Mr. *William Clift*, called in; and Examined.

Mr. *William Clift*.

8 March 1836.

596. Mr. *Hawes*.] WHAT situation do you hold at the College of Surgeons?—Conservator of the Museum of the College.

597. How long have you held that office?—Thirty-six years.

598. Then you were appointed somewhere about the year 1800?—Yes, at Christmas 1799.

599. Were you in the service of the College of Surgeons when certain presents were made to the college by the Trustees of the British Museum?—I am not aware that they ever made a present.

600. We have been informed by the principal librarian of the British Museum that certain presents were made to the College of Surgeons; that you were the person deputed to receive the articles transferred by the Museum to the care of the college?—It was a purchase.

601. Will you state of whom those articles were purchased, and what they were?—This transfer, to which I presume you refer, of certain specimens of natural history from the British Museum to the College of Surgeons, took place in May and June 1809, in consequence of an application made to the college from Sir Joseph Banks, one of the Trustees of the British Museum, through the medium of Mr., afterwards Sir Everard Home. It was understood that, as the Trustees of the British Museum had no power to give them, they must be purchased, which the college agreed to do.

602. Will you state what articles were purchased?—The specimens were very numerous, and had been accumulating probably for ages in the souterrain or basement story of the British Museum.

603. Will you describe, as nearly as you can, what specimens they were that you purchased?—There were a great number of old mutilated skeletons; skulls of elephants, and other animals; many discarded stuffed skins that contained some small portion of the bones of the feet and of the jaws; they were completely spoiled by time and moths; there was also a very large collection of store specimens in bottles, not prepared, that is, not put up in the ordinary way, but apparently in the bottles in which they had been brought from abroad.

604. They appeared never to have been opened and examined?—Many of them certainly had never been examined, and some of them had belonged to the collection of Gresham College; many of them were as ancient as that period; a few having been figured and described by Grew, in his account of the contents of the museum of that college.

605. Go on describing the specimens?—The specimens consisted of examples of almost every genus of animals; there were zoophytes, frogs, snakes, birds, quadrupeds and human fœtuses.

606. Were there any cases of birds?—No.

607. No cases of birds?—Not one.

608. In what manner were they transferred to the College of Surgeons; were they in cases, or in bottles, or packages of any sort?—All that were not in bottles were loose specimens; there were no boxes or drawers.

609. Did the College of Surgeons attach much value to those specimens?—They could not attach much value to them; they were more useful than valuable; many things being useful and necessary to a lecturer, to which you cannot attach much value.

610. They

610. They considered them valuable?—Yes, they were valuable to that extent.

611. What did they do with them?—We have a considerable number still remaining; but a very large proportion were immediately thrown away; they were quite spoiled before they had been discarded, from being very badly and insecurely put up. I have no doubt that many of them were among the earliest specimens of natural history that had been attempted to be preserved in spirits; probably from the time of Hooke downwards.

612. Of whom did the College of Surgeons purchase those specimens?—I considered it to be from the Trustees of the Museum; Sir Joseph Banks being a Trustee, and in communication with the other Trustees, that it was consequently, I presume, by and with the consent of all the Trustees; indeed Lord Colchester told me so. I certainly had no interview with the British Museum Trustees on the occasion of this transaction.

613. Did the College of Surgeons pay any money to any one?—Yes, 175 *l.* 10 *s.*

614. To whom was that money paid?—To Mr. Planta, the principal officer of the Museum. When this transfer, if we may so call it, or sale, was proposed, it was stated that, as the British Museum could not give anything away, but that they were entitled to sell duplicate specimens and the refuse of their collection, it was proposed and agreed to, that a sworn appraiser should be employed to set a value upon those specimens.

615. Were any of the ornithological specimens valuable or rare?—I imagine that there were very few indeed, if any, of that description.

616. Were the specimens connected with comparative anatomy valuable or rare?—No, none of them; they were in a very bad condition indeed.

617. The mammoth's head, for instance, was that a good specimen?—I do not know; I never could discover any such specimen amongst them.

618. It is stated, upon the authority of the principal librarian of the Museum, that the mammoth's head was amongst the specimens sent to the College o Surgeons?—I will explain that. Dr. Shaw had the charge of the natural history specimens; he pointed out to Messrs. King & Lochee, the auctioneers of King-street, Covent-garden, who were employed as men more likely to know the value of specimens of this kind than any other persons, as they had, three years before that time, viz. 1806, sold that enormous collection, the Leverian Museum, and consequently were better judges than others who even dealt in articles of that kind. I accompanied Mr. Lochee several days when making this appraisement, to ascertain what we were to receive; and all the specimens were pointed out to us by Dr. Shaw and Dr. Gray, but chiefly by Dr. Shaw, because they were chiefly in his department. He pointed out to Mr. Lochee what were and what were not to be included in his valuation, because there were many other things in the rooms; fossils, minerals, horns, and things of that kind; and a good many cabinets and chests of drawers, containing anatomical specimens not to be taken into account at all.

619. Did the college purchase any article at the sale of Mr. Bullock?—Yes.

620. What did they purchase at that sale?—Nothing that had ever been in the British Museum; not a single article. The purchases were nearly, if not entirely, fossil bones.

621. Do you or do you not know that certain specimens, sold by Mr. Bullock, were labelled as a part of the collection of Sir Joseph Banks?—No. Mr. Bullock did not so describe them; he described them as having been brought to England by Sir Joseph Banks. It was not once mentioned that he had received them from Sir Joseph, or that they had ever been in the British Museum.

622. Have you a distinct recollection that in the catalogue of Mr. Bullock's sale there was no article labelled as a part of the collection of Sir Joseph Banks?—Certainly; but it was merely described as "brought to England by Sir Joseph Banks;" but I might probably explain, that when the Leverian Museum was sold, three years before this transaction, Mr. Bullock, who then resided in Liverpool, had an agent in London, who attended the whole of that sale, and purchased very largely, in order to increase his "Liverpool Museum," which was but small at that time. He was a silversmith at Liverpool, but took a fancy to natural history, and began to form a collection, because he had often opportunities of purchasing specimens from the shipping. As I have before said, he purchased very largely at the Leverian sale; and, as every one knows who

Mr. *William Clift.*

8 March 1836.

recollects that collection, there was a very large number of specimens brought to England by Captain Cook and the gentlemen who accompanied him, and by Sir Joseph Banks amongst the rest. It is probable that some of those specimens, although I cannot pretend to say so with certainty without referring to the Leverian catalogue, that many of those were given to Mr. Parkinson, the proprietor, by Sir Joseph Banks; but I know there were a great many specimens in that museum collected during that voyage. It is also well known that Mr. Bullock and Sir Joseph Banks were on very intimate terms; Sir Joseph Banks was a great patron of Mr. Bullock, and encouraged him exceedingly.

623. Out of the specimens sent by the Trustees of the Museum to the college, did the college select such as they thought most useful to them, and dispose of the remainder, or any portion of the remainder?—The college gave a few specimens of the dried birds' skins to Mr. Bullock, they never disposed of any of those in spirit, as the greater number were: 180 *l.* was the net sum that Mr. Lochee valued them at.

624. What was the sum paid?—£. 175. 10 *s.*; because 180 *l.* was the net sum that Mr. Lochee valued them at, and it was agreed when Mr. Lochee was employed, that a moiety of the expense of the valuation was to be paid by either party, and he had five per cent.

625. Therefore 180 *l.* was the sum estimated?—Yes.

626. Mr. *Elphinstone.*] Was it paid by a cheque?—Yes; I took a cheque from Sir Everard Home, he was the medium of communication between the college and the Museum, as he was a member of the council at that time, and one of the curators of the Museum, and one of the professors of anatomy to the college; I took the cheque from Sir Everard to Mr. Planta.

627. Mr. *Hawes.*] If there should be any mistake in the accounts of the Museum, the fact will appear in the account itself?—Certainly; or in that of the college.

628. What was the date of the transaction to which you have alluded?—Upon reference to my account-book, I find it was on the 27th of May 1809 that I paid the money.

629. Mr. *Compton.*] Do I understand you rightly, that 175 *l.* 10 *s.* were paid for specimens bought of the British Museum?—Yes, that was the exact sum.

630. Were any of those specimens again sold?—No, they were given away, those that were parted with.

631. Mr. *Hawes.*] Have you assisted in classifying and arranging the collection of the College of Surgeons?—Yes.

632. Can you state to the Committee whether the classed catalogue published by the College of Surgeons is much used and highly valued by those who frequent the museum?—I think it is; I am sure it is.

633. Is it sold?—Yes.

634. What is the price of it?—There are six parts, and two volumes and a half volume, now printed.

635. Are the parts sold separately?—Yes.

636. What is the price of a part?—They all differ in price, except two, in proportion as there are a greater or less number of sheets, from 3 *s.* to 9 *s.* for the small parts; and the Volumes I. and II., and the half first part of Volume III., are sold at the same price, 21 *s.* each, because they are as nearly as possible equal, and on account of the engravings illustrating them. (*See* Appendix (A.)

637. Are they sold by the college or by the publishers?—By the college only; I have the charge of them; they have never been sold out of the college.

638. Can you give the Committee any account of the number sold?—Yes. (*See* Appendix (B.)

639. Sir *Robert Inglis.*] In reference to the purchase, to which you have referred, by the College of Surgeons from the British Museum, can you state what portion of the sum of 180 *l.* which you have described as the amount of the purchase, was considered the value of the birds, or the bones, or the insects, or the cases, or in short, generally how the sum was subdivided?—I asked Mr. Lochee to let me look at his memoranda, as he made them in a hand-book, as I wanted to know what value he attached to particular specimens or parts. He said, "No, we never permit that."

640. Without reference to Mr. Lochee's estimate of the value of the items of the account, can you state to the Committee what, in your judgment, was the value

value of the glass cases transferred to you by the British Museum?—There were no glass cases whatever, they were only bottles.

641. Varying the question, then, to the bottles, what was the value of the glass bottles?—I should imagine that they were equal to more than half the entire amount.

642. Equal to more than 90 *l.* of the 180 *l.*?—I should imagine they were worth more than 100 *l.*

643. Mr. *Hawes.*] Have you ever visited the collection at the British Museum?—I never visited it in my life merely as a visitor; I have always intended to do so, but have never yet found time.

644. How is it, as you have been long engaged in zoological pursuits, you have never visited the national collection?—For the best reason in the world, that I had too much to do at home.

645. Did you not feel it necessary, in order to enable you to arrange your own specimens, to see the mode adopted in the national institution?—Not a bit; we had a better collection at home, and in better preservation.

646. In what respect do you consider the collection at home better preserved?—Because we understood the thing better.

647. In what respect do you understand the thing better?—We supply the specimens with new spirit when needful, and tie them over in a better manner.

648. How do you know that it was in a better mode, if you never visited the British Museum?—I have visited it many times for special purposes; I have passed through almost every room on the premises, but it was merely passing through.

649. And passing through, you observed that their mode of keeping the specimens was not so good as that practised by you?—A practised eye will quickly distinguish these things, but I judged principally by those we purchased, which were in a very bad state, and very badly preserved from the beginning.

650. Did you mention it to any officer of the British Museum at the time?—It did not need to be mentioned, the thing spoke for itself.

651. Did you call their attention to it, and hear their explanation?—I merely went to remove the specimens we purchased, and not to make remarks.

652. Will you state what you saw in these rooms?—All those articles visible to the public were in a very good state, compared with those below.

653. When you went below, will you describe exactly what you saw?—It would be a very difficult matter.

654. Try and do the best you can?—If I had gone into Noah's ark I conceive it would have borne a strong resemblance to it, because those rooms below were filled with specimens of every kind; they were mere store-rooms.

655. Valuable specimens?—No, chiefly refuse.

656. There was nothing valuable?—Yes; there was a very large collection of horns that occupied the walls, they were valuable, and they are still in the British Museum.

657. Mr. *Elphinstone.*] If it has ever been stated that those articles had never been neglected at any time, and merely wanted dusting, your opinion would be contrary to that so expressed?—I should imagine the specimens purchased by the college had never been dusted from the time they were placed in the basement of the Museum.

658. Sir *Philip Egerton.*] When you state that the collection at the College of Surgeons is better kept, and in better condition than that at the British Museum, will you have the goodness to specify to what portion of the national collection you allude?—I speak to the then state of the natural history generally. I speak of the manner in which the preparations were displayed in the bottles, and the neatness of their being tied over.

659. Mr. *Hawes.*] Your evidence is confined to the zoological collection in the Museum?—Certainly thus far, and refers to no other part of it. There is, however, one point I wish to speak to at this moment, which is, that among the specimens that were in those underground rooms there were some which were pointed out to us by Dr. Shaw, as specimens we were to remove, in order to clear the place and make room, which had been sent to the Museum about six or seven years previously by Sir Joseph Banks. It appeared, on subsequent inquiry, that those specimens had been sent to Sir Joseph Banks from the Emperor of Russia. In 1802, Mr. Rembrandt Peale, of Philadelphia, brought a skeleton of what he called a mammoth to this country, and exhibited it in Pall-Mall. This

Mr. *William Clift.*

8 March 1836.

was the first specimen of the kind that had ever been exhibited, or at least it was the first I ever recollect that was mounted. Russia also had its mammoth, and the Russians hearing of this skeleton being exhibited in London, were desirous of knowing whether the American mammoth and the Siberian mammoth were identical, because the subject at that time was in its infancy. Mr. Peale's skeleton was a mastodon, an animal differing in many particulars from the Siberian mammoth, which is a true elephant. Sir Joseph Banks had been applied to by some persons (whom I do not know) in Russia, to procure a sketch or drawing to be made of this skeleton. Sir Joseph Banks requested me to do it; I did it from recollection, and frequent revisits for the purpose of correction, as Mr. Peale would not permit a drawing to be made, nor too near an inspection, and he sent this sketch to St. Petersburgh, to convince them, as it must do in a moment, that it was not the same, though analogous to the Siberian mammoth. In return for that information which Sir Joseph Banks sent them, the Emperor of Russia desired that some specimens might be sent to Sir Joseph Banks, and there was a list sent with them, a written list on half a sheet of paper; it described perhaps a dozen parts of animals that they had sent. Among those was stated to be the skull of a mammoth (which was alluded to just now), the skull of a rhinoceros, fossil also. They are remains of animals found in Siberia, that do not now exist there; the horn of a rhinoceros in a decomposing state, a pair of reindeer's horns, the single horn of the ovis ammon, *i. e.* the great cornu ammonis, horned sheep, both the latter in a recent state, and some few others, which I do not now recollect. Those articles had been sent by Sir Joseph Banks to the British Museum, with the list. I had no time allowed or opportunity of comparing what I saw upon the floor with the list; that list was put into my hand that I might hunt out the specimens as I could. When the Emperor of Russia was expected in this country in 1814, Sir Joseph Banks, recollecting those specimens, went to the Museum, because he supposed that the Emperor, who looked sharp enough about him, might inquire for those specimens, which were of course not to be found there. Mr. König came to me (whether Dr. Shaw had died in the interim I do not know, I think he had), Mr. König came to me to know if we had received those specimens described in that list; we set to work and ransacked our store-room, where all those specimens had been put, to endeavour to make out what we had, and what we had not. I discovered the rhinoceros's skull and the horn, which was of considerable length, nearly a yard long, and in a decomposing state; and two or three other specimens were also found, according to the list, among the elephants' skulls, of which we had several from the Museum in a dilapidated state. I did not know then so well as I do now what a Siberian mammoth's head ought to be like; but as we had in our collection a grinder from the Siberian mammoth, this was my guide in looking for this supposed mammoth's skull, that we could not find; but we found the lower jaw of an elephant, and the other things I have mentioned, and which were, at the particular request of Sir Joseph Banks, sent back to the Museum, in case an inquiry should be made.

660. And they were received by the Trustees of the Museum?—Yes.—Sir *Henry Ellis.*] And are there now.

661. They are there now?—Yes, I presume so.

662. Mr. *Elphinstone.*] Were they labelled?—No, they were not when we received them; I put labels on them all, to prevent their being, by any accidental remove, confounded with the Hunterian or other specimens in the museum of the college; but we found so many corresponding with the list, there could be no doubt that they were the specimens so described.

663. Mr. *Hawes.*] Which had been sold to the College of Surgeons?—Yes, those were among an enormous quantity of rubbish heaped together on the floor in those lower rooms.

664. Sir *Robert Inglis.*] Forming part of the purchase of that 180 *l.*?—Yes.

665. Mr. *Hawes.*] The lower rooms you speak of now are the lower rooms of the Museum?—Yes, the rooms of the basement. Their contents generally were hardly good enough to be displayed in the rooms up stairs; that was the reason they were sent below.

666. But they were sent back to the Museum, and accepted by the Museum, to show the care they bestowed upon the collection sent originally by Sir Joseph Banks?—They were returned.

667. Are

667. Are they now in the Museum?—I have no doubt they are; I do not know.

668. Mr. *Bingham Baring.*] Did you understand that they were sent for back again on account of their value, or on account of the circumstance of their having been presented by the Emperor of Russia?—The object appeared to me to be, that in case the Emperor of Russia visited the British Museum, and inquired for those specimens, that he might see his old friends.

669. Mr. *Hawes.*] In fact, whatever is their value, they are the property of the College of Surgeons?—No, they are not; I am coming to that. About 1828, a Mr. Corse, a gentleman who had resided in India for a considerable time, who went out as assistant surgeon, but became an elephant driver or inspector, and having the charge, for the East India Company, of purchasing elephants for their service, he consequently paid a good deal of attention to the various castes of elephants, and he met with two particularly fine skulls of elephants, of different castes, one with very large tusks, such as we see in cutlers' shops, and the other, whose tusks never grew large or curved, and only extend just beyond the lip. The first was the dauntelah, and the other the mooknah. Mr. Corse, about the year 1786 or 1787, sent those specimens as a present to the British Museum; they were very large and fine, and very perfect; they stood for a considerable time in the hall of the British Museum. They, the trustees, had gone to the expense of having two very handsome termes or pedestals of imitative porphyry, on which they stood, which many gentlemen present may recollect to have observed; but as we were to have every thing that was anatomical, those were included in the purchase made by the college, and those we also had. They were larger than any we had in the Hunterian Collection; and when they were arranged in the new Museum, they were placed over the centre case, on each side of the gallery, and our own specimens, being smaller, trended off to the right and left, down to the youngest. Mr. Corse, when he returned from India, brought a considerable number of elephants' heads, of various ages; and he wrote a very interesting paper upon the subject, printed in the Philosophical Transactions for the year 1799; he wrote, in fact, two papers, one on the natural history of the elephant, and the other on its mode of dentition. About 1828, Mr. Corse, though he used frequently to visit the museum of the college when he came to London, and saw these skulls, and how we had placed them, and seemed perfectly satisfied that we had them; he thought them better placed than at the Museum; they were more in accordance with the objects around them; but Mr. Corse, very shortly after that, paid a visit, with some ladies, to the British Museum, and he chose to find great fault that those skulls of his had been parted with, they being a donation to the Museum; and he made a formal complaint to the Trustees, insisting upon their requiring their return. The college could not then help considering, that as the British Museum had reclaimed so many fossils, and these two elephants' skulls, that were certainly the jewels of the whole collection purchased by them, that it was only fair and proper that the British Museum should refund some part of the purchase-money. This was mentioned to the Trustees, and they consented that half the money should be returned to the college; the fact was, these constituted half the value of the whole of the specimens.

670. Mr. *Hawes.*] What year was this?—1828. The skulls were returned on the 28th of May, by the hands of Mr. Gray.

671. Mr. *Elphinstone.*] Did the British Museum repay this money?—It never passed through my hands; the payment did, but not the re-payment; the secretary can state that. £. 175. 10*s.* was the sum paid in the first instance; and half of that sum was to be, and I suppose was, returned to the college, on account of the reclamations.

672. Mr. *Hawes.*] Do you know in what manner the money was repaid to the college?—No, I do not; it never passed through my hands.

673. Did you ever have any conversation with the principal librarian, who has the expenditure of the Museum, upon this subject?—Not that I recollect, at all. Dr. Shaw was the person always in communication with me; all the specimens were under his lock and key, and we could not get into the rooms till he came; he always accompanied us, and one of his assistants, in order to point out what was to be put into the valuation and what not; because there were many subjects that remained in the rooms after we had got the rubbish.

Mr. *William Clift.*

8 March 1836.

674. Sir *Philip Egerton.*] When you state that the collection of the College of Surgeons is better kept than that of the British Museum, will you have the goodness to specify in detail the branches of the department to which your observation refers?—The question that was put to me was as to the state of the specimens in the rooms on the ground floor, that were to be transferred to the College of Surgeons; I might also have included those in cases on the first floor; they were not equal to ours in appearance.

675. Then your observation has reference to that portion of the collection?—Yes; I had nothing to do with anything but zoology, including the old anatomical preparations; we had nothing else; we had nothing to do with any other part than zoology; we had nothing to do with botany or mineralogy; and I wish my remarks to be considered as applying only to the date of the purchase; viz. 1809.

676. Mr. *Bingham Baring.*] Did Sir Joseph Banks in person superintend the transference of those specimens from the British Museum to the College of Surgeons?—It was quite impossible he should, but he was cognizant of what was done. I very often saw him; he was a trustee of the Hunterian Collection as well as of the British Museum, and it was through Sir Joseph that the transfer was made; but he being exceedingly lame, I think I may say certainly he never could have got down, nor been carried down, those winding stairs to see the specimens as they lay; and it would have been to very little purpose if he could have done so, it was such a chaos.

677. Sir *Robert Inglis.*] In reference to the transaction about the mammoth remains from Siberia, do you wish the Committee to understand that they were originally presented by the Emperor of Russia to Sir Joseph Banks personally, and by Sir Joseph Banks to the British Museum, and thence, at his suggestion, to the College of Surgeons; and that they were afterwards reclaimed from the College of Surgeons by Sir Joseph Banks individually, with a view to the possibility of the Emperor Alexander seeing or not seeing those remains so presented by him to Sir Joseph Banks?—How they were sent to Sir Joseph Banks of course I do not know; I only know that they were sent from Russia to Sir Joseph; I only know what I was told by Sir Joseph Banks; I cannot say how they came; they came from Russia to Sir Joseph Banks at Soho-square, and were sent by him to the Museum.

678. By your former answer, do you or not wish the Committee to understand that they were presented by Sir Joseph Banks to the Museum as they had been presented from the Emperor of Russia to Sir Joseph Banks?—He sent them to the British Museum.

679. Whom do you mean by he?—Sir Joseph Banks.

680. Did Sir Joseph Banks, so far as you know anything of the transaction, recommend their being sent to the College of Surgeons?—No; it is very possible that Sir Joseph Banks had entirely forgotten the occurrence altogether at the time of this transfer.

681. Did ever Sir Joseph Banks, so far as you know, recommend their being reclaimed from the College of Surgeons?—Yes.

682. Do you wish the Committee to understand that they were so reclaimed by Sir Joseph Banks, with the view of his being able to show them to the Emperor Alexander?—Yes, certainly; Sir Joseph told me that such was his object.

683. Mr. *Hawes.*] To show them as a part of the national collection?—Yes, I presume so.

684. And that they should appear as a part of the national collection?—Yes, that I understood was the meaning.

685. They having been only recently returned to the national collection for that purpose?—I have the date of it; I think it was about a week or two before the arrival of the Emperor of Russia in London.

686. Placed in the Museum, in order that the Emperor might see that his donation was carefully preserved?—It was a donation to Sir Joseph Banks.

N.B.—They were returned on the 10th of May 1814. The Emperor arrived on the 7th of June.—*W. Clift.*

687. Sir *Robert Inglis.*] Therefore Sir Joseph Banks was responsible to the Emperor of Russia in his personal character, and not as one of the Trustees of the Museum?—Yes, I suppose so.

688. Mr. *Hawes.*] But Sir Joseph Banks, in his personal character, had deposited them in the care of the Trustees of the Museum?—Yes.

688*. You received them from the Trustees of the Museum?—Yes, by the hands of Dr. Shaw, their officer.

689. Have you not stated that some of those skulls were considered the jewels of the collection in the Surgeons' Hall?—Not the specimens from Russia: they were Mr. Corse's skulls to which I applied that epithet. I do not mean to imply that the specimens from Russia sent back to the Museum were worth any considerable part of the amount paid.

690. But Mr. Corse's skulls were sent back?—Yes, with their pedestals, the 28th of May 1828.

691. They had originally come from the custody of the Museum?—Yes.

692. And they were considered valuable?—Yes; I should say that they were worth all the rest of the collection; perhaps excepting the calculi.

693. They had been obtained from the British Museum by the College of Surgeons?—Yes, as a part of the anatomical articles.

694. And having received them, you prized them as the jewels of the collection?—Yes; there were no other individual specimens of equal value.

695. Sir *Robert Inglis.*] And by Mr. Corse's desire they were sent back?—Yes; or rather by the desire of the Trustees.

696. Mr. *Elphinstone.*] Did you receive any skins from the British Museum?—Yes, skins of birds, and some of other animals.

697. What did you do with them?—We have a very considerable number of them now.

698. Did you dispose of any of them?—No, not by sale; there was a very considerable number of birds in spirit, which were merely the pelts of birds.

699. Did you part with any of those injured skins to Mr. Bullock?—Yes; the college presented a few to Mr. Bullock, but only dried ones.

700. Sir *Robert Inglis.*] When you describe the two skulls as the jewels of the collection, do you regard them as valuable to your collection, considering it peculiarly rich in comparative anatomy?—Yes, on that account only.

701. Is there any department of comparative anatomy from which they were extracted in the British Museum?—No, they had none.

702. That which might be extremely valuable to you did not form a jewel in the collection of the Museum?—Certainly not.

703. Did you ever see a report made by Sir Joseph Banks on the terms of the transfer, whatever they might be, from the Museum to the College of Surgeons?—No, not to the best of my recollection.

704. You cannot state whether the Siberian remains were or not included in that report?—I do not suppose that Sir Joseph Banks knew one way or the other, except that the Trustees of the British Museum were very desirous that the rooms in which the specimens were contained should be applied to other purposes. I understood that a large collection of books were to occupy the place of those refuse specimens, and they wanted to clear away this enormous accumulation of trash, as the greater part might be truly considered.

705. Mr. *Hawes.*] Do you take great care of donations in the College of Surgeons?—As much as we can.

706. And taking care of the donations bestowed upon that collection, perhaps induces others to make further donations?—Without doubt; we always used formerly to put the name of the donor on the top of the bottles, or on the specimen, but now we insert them in the catalogue.

707. Then you are of the same opinion as Sir Henry Ellis himself, whose opinion is elicited in the following question and answer, which I will read to you: "Question 468. Do you understand that one of the objects of the Trustees, in desiring that the duplicates being in their possession by gift or bequest may always be retained in their possession, is to encourage such gifts and bequests from other parties?" He answers, "I conceive so." That is your opinion?—Yes, no doubt; but that must be taken with some limitation, and discretionary power of accepting or refusing duplicates and valueless objects, without intending to give offence. Those who have the care of a collection must not be compelled to accept and preserve every thing offered to them, or they must soon have need of a much larger museum than the British Museum to contain them; independently of the item of expense of preservation.

708. Mr. *Marshall.*] Do you know of any transaction that took place between the

Mr. *William Clift.*
8 March 1836.

the Museum and the College of Surgeons previous to the one you mention, when articles were bought for 180 *l.*?—That was the first, I believe. I think there was no transaction whatever prior to that period, and certainly no money transaction before or since the original purchase and reclamation.

709. Mr. *Hawes.*] That was the first transaction that took place between the College of Surgeons and the British Museum?—Yes.

709*. Mr. *Compton.*] In referring to Sir Henry Ellis's evidence, in question 1586, I see that a mass of articles were transferred to the College of Surgeons, consisting of specimens of diseased bones, injections and preparations, hair balls from the stomachs of cows, and concretions from horses, and calculi: were those the specimens bought by the College of Surgeons?—Yes, they were part of this same consignment or purchase.

710. Those were the specimens found on the basement story of the Museum?—Some of the least valuable of those specimens were below; but the principal part of the concretions now spoken of were in a better state, they were on the first floor.

711. But they were not given, they were bought?—They were bought, as part and parcel of the lot.

John Flint South, Esq., called in; and Examined.

J. Flint South, Esq.

712. Mr. *Hawes.*] YOU are lecturer of comparative anatomy at St. Thomas's Hospital?—I was formerly lecturer on comparative anatomy at that hospital, but I have not lectured there for some years.

713. You are one of the surgeons at St. Thomas's Hospital?—Yes; I am assistant surgeon.

714. Have you had your attention recently drawn to the state of the collection in the Natural History department at the British Museum?—I have lately been several times over the Natural History department in the British Museum.

715. Will you favour the Committee with your opinions on the condition and arrangement of that collection generally, in the first place?—I think, generally speaking, there are materials to supply a fine zoological museum, but I do not think the arrangement is sufficiently complete to be useful to a student in natural history.

716. Are you of opinion that such an arrangement might be made as to be useful to the student, and at the same time susceptible of producing interest and amusement, and combining instruction to visitors generally?—I decidedly think it might; and that the one would of necessity spring out of the other.

717. Is there any distinct system adopted, either in regard to nomenclature or classification?—The mammalia are arranged, but not fully, I think, according to Cuvier. The birds are arranged in two sections, the one confined to British birds, whilst the other includes generally the whole class of birds. Both sections are generally, though not completely, arranged on Temminck's plan. The reptiles are put away, one can hardly say arranged; they are so closely packed, that it is almost impossible to examine them; and the fishes are much in the same state.

718. Do you think it expedient to adhere strictly to the system of any one eminent zoologist, marking specially any deviations; or do you think it expedient to allow the keeper of the department, at his own arbitrary will, however well informed he may be upon the subject, to make deviations?—If visitors and students had at all times the keepers of the several collections in attendance upon them, then I hold there could be no objection to the keeper employing such names as he might think proper, because he would at once give the reason why the nomenclature he employed deviated from any particular arrangement which the student might be using. But if, as is the case, it be utterly impossible that such reference can be had recourse to, I do hold it far better to employ the system of some well-known and great authority, Cuvier for instance, whose arrangement is adopted with regard to mammalia in the Museum, and that in all the great points his arrangements should be adhered to closely. With regard to the minor parts, the genera and so on, the keeper ought to have full authority to make such alterations as he might think fit, provided always that in any catalogue or account of the collection those variations should be stated.

719. Then

719. Then if any infringement be permitted on any established system, you think it should be specially marked?—Decidedly.

720. So that it should be evident to a popular visitor, as well as marked to the scientific visitor?—Yes.

721. With regard to the characters of the orders and tribes, the very foundation of that division should be generally noted upon the labels or cases?—As at the present time animals are not arranged entirely on external characters as heretofore, I think it would be very advantageous that, in the front of every case in which any order or tribe is placed, the parts of the animal forming the anatomical characters upon which such order or tribe is founded should be placed. It might so happen that the order contained only one or two, or 20, 30 or 50 different genera, but still the great character should be attached to such order. And all those characteristic parts, I apprehend, might be obtained from waste specimens, which could not be made use of otherwise, but thus used would be highly advantageous to the student.

721*. Are those general rules adhered to in the collection at the Museum?—No, certainly not.

722. Is the collection particularly deficient in that respect?—I do not exactly understand the question.

723. With reference either to an established system; with reference to the indication of the character of particular tribes, is the collection in the British Museum so labelled as to satisfy you upon those points generally?—No.

724. Could you point out more particularly the instances in which those rules are not adhered to?—A very large portion of the monkeys are unnamed; all the bats, with the exception of a very few, are unnamed; a large portion also of the rodent, and also of the smaller digitigrade and insectivorous animals, are similarly circumstanced; but really I cannot enumerate all. I perfectly well recollect, however, that a very large portion of the collection of beasts is unnamed.

725. In fact, generally speaking, the classification and the naming of the specimens is deficient?—Yes, I think so.

726. And, in your opinion, not such as it ought to be in a national collection?—Certainly not.

727. With regard to the names employed, do you think that scientific, as well as the common names, should be added to the labels?—Decidedly.

728. Is that the case generally in the Museum?—I think both names are generally attached where the animals are labelled.

729. Was is not more the case in past times than in the present?—I have understood that years ago, and indeed it has been given already in evidence before this Committee by Mr. König, that labels with the French and German names, as well as the scientific names, were attached.

730. Is it not of importance also that the locality from which specimens are obtained should be noted?—Yes.

731. Is that the case at all in the Museum?—In the lower animals it is general, I believe, but in none of the vertebrated classes, as far as my recollection serves me.

732. It would also add to the usefulness of the collection if the foreign names were added?—Most certainly.

733. Sir *Robert Inglis.*] Do you think it correct to state that unscientific names are actually attached to many specimens in the Museum?—I presume by the term unscientific, the common names by which animals are known are meant. If so, I think it is advisable they should be attached. They are the names by which, in most instances, such animals are alone known to the unlearned, and a person not conversant with the scientific name of any particular animal, of which he knew the vulgar name, would be puzzled in endeavouring to find it if the scientific name were alone attached.

734. Your answer applies to the question as if it had been put whether the common name should alone appear; the question was rather, whether, from your observation of the collection in the Museum, you would say unscientific names were attached to many of the specimens?—I do not mean to state that.

735. If it were stated that unscientific names were attached, you would think it not founded in fact?—I have seen some very odd names upon the shells in the Museum.

[*A Paper was handed by Mr. Hawes to the Witness.*]

J. Flint South, Esq.

8 March 1836.

736. Can you state any instances in which you regard them as unscientific, or without some authority for the nomenclature?—In many instances where new animals have been found and named, they have no vulgar name, no provincial name attached to them, and generally speaking, I believe naturalists do not endeavour to coin new English names to apply to them, but are content to use the scientific terms. Some of the names on this paper I have seen certainly upon the shells in the collection. Here is the genus Trivia, the wide-mouthed pig, and sundry other species of this genus, New Holland pig, the European pig, the louse pig, the rice pig, the flea pig; another genus is named the cap of liberty, another the ear drop, another the devil's claw, another rose-bud, and the common paper nautilus, as it is called, and which every body knows by that name, is here called the paper sailor, and one near it the glassy sailor.

737. From your knowledge of the collections in the British Museum, do you state to the Committee that such names occur without any scientific names also?—No, with the scientific name.

738. Do the Committee understand you to object to the occurrence of those popular names?—No, I do not, where they have previously existed as provincial or vulgar names; but I do object, and I believe most naturalists would object, to forming new and rather fanciful names for animals which had no such name previously, when they possess scientific names, by which they are well known.

739. Some of the former questions have proceeded upon the assumption, that it is desirable to make the Museum a school of popular amusement and instruction as well as of scientific research; with that view do you consider that the scientific name being always found, there is any positive objection in the prefix of the popular name?—None if there be a popular name already; but if there be no popular name, I do not see any advantage is derived from such new-coined popular name, because it conveys no additional knowledge to the party seeing such specimen.

740. The answer assumes, that those names to which you have called the attention of the Committee are absolutely new, and not found in the works of any traveller, as well as any scientific writer?—I believe not.

741. Mr. *Hawes*.] You object to the introduction of vulgar names, or the corruption of vulgar names existing?—Certainly I do to new-formed vulgar names, but not to the common names by which animals are generally known, as I have already stated.

742. Mr. *Bingham Baring*.] Are the Committee to understand that you believe those names to be coined by the officers of the Museum?—I do not say that; but to the best of my recollection the names I have here mentioned I have never met with elsewhere.

743. Sir *Robert Inglis*.] Do you state to the Committee that the names which you have specified are found in the Synopsis as well as on the specimens themselves?—I am not quite sure about that; I do not recollect at this moment, but I think not. With reference to these names on the paper of genera put into my hand, there are only the scientific names in the Synopsis.

744. Would you state that many of the most interesting or rare specimens of any class are exposed to destruction from dust and insects?—No, I cannot say so.

745. If that were stated you would not consider that description correct?—They might be exposed to insects without it being observed, except the specimens were in a very bad state, unless the cases were opened for their being examined.

746. You would not describe any portion of the collection in the Museum, particularly the most interesting and rare specimens, as exposed to destruction at this moment from dust and insects?—No, certainly not.

747. Would you say they wanted their scientific names?—Yes, certainly. [*A Synopsis of the collections in the British Museum was handed to the witness.*] The odd names that have been handed to me are not here, only the scientific names.

748. Mr. *Elphinstone*.] Suppose each specimen to have a scientific label affixed to it, do you think it advisable to encumber the label with French and German vulgar names?—Yes, I do think it advisable to attach such wherever an animal possesses a French or German name.

749. Sir

749. Sir *Robert Inglis.*] The former question referred to travels, as possibly containing some of the non-scientific names to which your attention had been drawn; can you state to the Committee whether some of those known scientific names may be found in sale catalogues, as indicating articles popularly so known to dealers; take for example Humphrey's Catalogue?—Yes, no doubt.

750. Mr. *Hawes.*] Do you think that a good source from whence to take popular names?—In most instances where names have been given to new animals by travellers, they have been the names they have received from the parties by whom they have been furnished with such animals.

751. Would you alter the popular name of the nautilus, for instance, which is known almost all over the world, upon such an authority as that?—No, certainly not.

752. And no catalogue would be a sufficient authority for such an alteration?—No.

753. And if an officer of the Museum was to refer to such a catalogue as an authority, it would be insufficient?—I should think so.

754. Are you aware whether any catalogue exists of the natural history collection generally?—I have never heard of one.

755. Do you or do you not know whether any such catalogues exist in the hands of some of the subordinate keepers of the departments?—I have heard there was a catalogue of Sir Hans Sloane's collection.

756. I mean a catalogue brought down to a much later date?—I believe Mr. Samouelle has catalogued a very considerable part of the insects.

757. It is not generally known to scientific men that there are accurate catalogues in manuscript?—No, I believe not.

758. You have not referred to such a catalogue?—No, nor heard of them.

759. What is your opinion of the expediency of forming a catalogue forthwith?—I think it would be extremely advantageous, not only as showing what animals the Museum does possess, and in what respects its wants might be supplied, but also it would enable the student to examine for himself the specimens, which are infinitely better than any knowledge he could acquire from reading only.

760. And one effect of such a catalogue would be, that the poverty or richness of the collection in any particular department would at once be manifest?—Unquestionably.

761. Do you think that if such a catalogue were commenced, and was published in parts, that it would meet with a sale?—I should think there is no doubt of it; and proofs that it would be used are furnished by the botanical catalogues which are published; one of them just occurs to me, the Hortus Kewensis, and others which might be named.

762. There are various catalogues in natural history that are the subjects of a constant and a steady sale?—Yes.

763. And of considerable value to the man of science and student?—Perhaps I am going too far when I say there are catalogues, properly so called; the catalogues that I suppose are alluded to are rather general catalogues of specimens than catalogues of specimens in any one particular museum.

764. But catalogues of particular specimens in existence would be valuable?—No doubt.

765. Is it not almost essential to the student in natural history that he should know where specimens are to be found?—If he wish to study the thing itself.

766. Do you think it possible to form catalogues at once useful to the scientific man and the popular visitor of the Museum, or do you think it best to keep them apart and publish them separately?—I see no reason whatever for keeping them apart. Such a catalogue would contain information useful to all. It might be got up in such a way as to be useful to the student and amusing to the unscientific person. There are many books upon natural history in common people's hands, which are works affording a vast deal of amusement and information; Pennant's British Zoology, Bewick's Birds and Quadrupeds, are well known to everybody; and Yarrell's Fishes is another example.

767. There are some German catalogues, are there not?—Yes; to the best of my recollection there are several.

768. Which are notoriously considered of importance both to the student and

J. Flint South, Esq.

8 March 1836.

and the more cursory and popular inquirer after information in natural history?—The German ones are more especially used for scientific purposes.

769. Do you think the labour or the expense of forming such a catalogue of the British Museum would be such as to prevent it being accomplished?—I think it no reason why it should not be accomplished.

770. Considering it as a national collection, your opinion is that such a catalogue should be undertaken?—Yes.

771. Do you think that a synopsis of the Museum might be made out of that book?—Yes, decidedly I do.

772. Are you acquainted with the Synopsis at all?—Yes. When I have wanted to find anything, I have looked into it for the purpose of finding its place in the collection.

773. Do you consider it a work bearing a high scientific character?—I do not suppose it was so intended.

774. Do you think it a useful popular work?—I cannot say that.

775. Do you think a synopsis of a national collection should descend to such details as that does on particular occasions, particularly with reference to salmon and cod?—I cannot say that those details have ever struck me.

776. You do not think it is essential that people should be told in the present day that salmon is good to eat?—Most persons know that.

777. Sir *Robert Inglis.*] Is there any work corresponding with the Synopsis in any collection on the Continent with which you are acquainted?—I cannot speak positively to that.

778. Is there any popular catalogue of the collection at Berlin, for instance?—That I cannot speak to; I have a notion that there is that sort of thing in Paris.

779. Mr. *Hawes.*] In reference to the officers of the Zoological department, do you think they are sufficient in point of number?—Certainly not; it is utterly impossible that the present zoological officers can do all, or anything like all, which so large a collection requires.

780. You are aware that the department of Natural History is under one keeper, as he is called?—Yes.

781. And that he has certain subordinate assistants, who are to be considered as subordinate and inferior to himself?—Yes.

782. Do you think that desirable in a department of science, the divisions of which are so essentially different?—I think each officer having the charge of a department ought to be distinct; he ought to be his own master, and amenable to no other officer in the house as such.

783. That the keeper of the department should in fact be the head of that department; responsible for its preservation, and perfectly independent?—Decidedly.

784. What is your opinion of placing the patronage of persons subordinate to them in the hands of the keepers of the departments?—As the person who is the keeper of the department is the responsible person, he ought to appoint his own subordinates, inasmuch as he is, or ought to be, liable for any mismanagement in the persons employed in his section.

785. What is your opinion of the expediency or inexpediency, supposing each head of department to be independent, of requiring him to lecture occasionally upon the subject of his department?—I think such arrangement would be extremely advantageous, because at present there is no opportunity of acquiring oral instruction in either department of Zoology in this country; the only instance in which there has been any such attempt is the 24 lectures on comparative anatomy given at the College of Surgeons annually, which amount not to much.

786. Would it not insure the collections entrusted to the keepers being turned to a profitable use, and also oblige the keeper of the department to keep up his knowledge on the subject to the latest period?—Certainly.

787. In England it is a fact that there is scarcely a single school in any department of science founded by any particular individual, however eminent?—I believe there are but three in London; the Gresham lectures, Mr. Fuller's endowment at the Royal Institution, and the lectures at the College of Surgeons, which are also an endowment, I believe.

788. But no distinguished man has at present an opportunity of founding a school of science?—Not unless at a most ruinous expense.

789. Would not the giving the lecture, in addition to the national collection, and

and allowing the privilege of taking pupils, be the means of founding such schools?—Undoubtedly.

790. Do you think it would be of importance, in a scientific point of view, that means should be taken to promote the formation of such schools by giving scientific men the facilities alluded to?—Certainly.

791. Sir *Philip Egerton.*] Do you consider that the same person could discharge efficiently the duties of curator of any one department in the British Museum, and also devote his time to giving public lectures?—Yes. I see no reason why he should not. We have instances continually among medical men, who with a much more extensive and harassing occupation than any officer of the Museum, lecture day after day for eight months in the year, and also have their lectures to prepare.

792. Would it not be necessary to increase the number of officers connected with the department to a much greater extent than would be necessary to insure the keeping the department in a proper state?—I think that, even under the present arrangement, an increased force is necessary; but I doubt whether it would be necessary to increase it to a very great extent beyond what is absolutely necessary now.

793. Sir *Robert Inglis.*] You have stated that you consider the actual force in the Museum as insufficient, even for the existing duties?—Most certainly.

794. Do you consider, assuming that lectures should be given, that the existing force in those departments will enable the parties actually holding the situations to give lectures in addition to their other duties?—No, certainly not.

795. Then the answer you gave to the preceding question, as to the expediency of the officers giving lectures, implies as a preliminary that the number of such officers should be increased?—Undoubtedly.

796. Do you consider that the British Museum is a fit deposit for a collection of comparative anatomy, looking to the other institutions in London open to such a purpose?—I do not think that the British Museum is a fit depository for a general collection of comparative anatomy. But I think there should be so much comparative anatomy as would elucidate the grounds upon which any arrangement of animals is founded; at the present time the Museum only exhibits external forms.

797. The question specified comparative anatomy, merely because it had been selected by yourself in a preceding answer (A. 785.); do you consider that the moral security, to use a phrase adopted by a witness last year (A. 3730.), which the country possesses in the character of the individuals appointed to the departments in the Museum, such departments as are open to lectures, is in itself an insufficient security for the fitness of the individuals to discharge the duties of such department?—I hold that the moral security to the public is or should be sufficient in the parties entrusted with the care of the collection which they have under their charge, otherwise they ought not to be placed in such situations; because it is quite impossible in any collection to have a check over the keeper of it, unless there were catalogues which should be from time to time reviewed and compared with the collection.

798. Has it ever occurred to you that on the private days on which artists are admitted to the Gallery of Antiquities, students in natural history might be admitted to the collections in the Museum?—I think it would be extremely advantageous if they were admitted under similar arrangements. There are many young men who would gladly avail themselves of such opportunity.

799. If such an offer were made to the professors in any institution in London, whereby they might be permitted to carry their pupils and demonstrate on the spot, do you think that such a proposition would have the effect which you desire to see realized by lectures delivered on the spot by the resident heads of departments in the Museum?—That is rather a difficult question to answer, because, as I stated before, at this present time there are really and truly no lectures on natural history delivered in London.

800. Are you aware of the lectures of Dr. Grant at the London University?—Yes; but I am also aware that the necessary attendance on lectures required of medical students is so extensive, that it is impossible during the time these medical lectures are given that a student should be able to give up his time to attend lectures on natural history; and, I believe, Dr. Grant's experience as well as my own will support my statement, that from the want of

J. Flint South, Esq.

8 March 1836.

time students are not able to attend those lectures, and not from want of disposition.

801. Do you consider that the object you have regarded as desirable, namely, the attendance of pupils on lectures on natural history, should be confined to those who have passed a medical course, or are not intended for it?—For any person, and certainly not restricted to medical students.

802. Extending the lectures far beyond comparative anatomy?—Yes.

803. Mr. *Hawes*.] May the lectures of Dr. Grant be considered to have more a medical object in view than any other?—No, they are merely lectures on comparative anatomy and physiology.

804. Mr. *Elphinstone*.] Would not the compelling the curators in the different departments to give lectures be a guarantee to the public that they were acquainted with the modern improvements in science?—Yes.

805. Mr. *Hawes*.] Would you impose any restrictions of any kind upon the professors in any department giving those lectures; in taking pupils, would you limit the number of his pupils; would you limit their access to the collections in the Museum, or require any sort of security?—I do not think there would be any need of restriction. Of course the students would not be allowed to go into the Museum and take the specimens down or pull them about, by which they would soon be spoiled. Such is not the case in any collection that I am aware of; they are admitted under certain restrictions, and behave themselves with propriety. They do not meddle with the preparations, and what they desire to see is so displayed that they can see it, and that in 99 instances out of 100, without the preparation ever being handled.

806. If the professors were allowed to take pupils, and use the national collection for that purpose, would there be any danger to the national collection?—I do not see any.

807. Would it not be turning the national collection to account by making it illustrative of the state of science?—Most certainly it would.

808. Would there, in your opinion, be any objection in allowing the professors to receive pupils, and to receive fees with their pupils, in addition to the emoluments derived from the country for their services?—I think it would be very advantageous, because naturalists generally are not very wealthy, though they may be very ardent men in their pursuit; and if they give up their whole time to the Museum, any means by which the professors in the different departments at the Museum could have additional remuneration afforded to them would be very just, and the Museum not damaged thereby.

809. Sir *Robert Inglis*.] You are aware that the Museum, as instituted, and as hitherto conducted, has not been a school of popular science or of general instruction, carried on by the means of lectures in any department?—Yes.

810. But as a depository of literature, arts and science?—Yes.

811. Do you consider that the change involved or implied in the immediately preceding questions is desirable?—Yes, decidedly, I do.

812. At the same time being aware it is a total change?—Yes, I do think so; it would render the collection in the Museum infinitely more valuable.

813. Do you think that the object would be obtained, with more or less advantage, by the creation of a totally distinct institution, or by the incorporation of such an institution with the Museum by the measures you suggest?—I think it would be best attained by the incorporation into the present institution, because the keepers of the Museum should be such fit persons to give lectures, and would have the materials all ready to their hands in the collection.

814. You stated, in a preceding answer, that you considered the existing officers of the Museum could not possibly discharge the duties of their departments and to their pupils at the same time; the question now put refers not to the employment of the existing officers at the Museum, in the character of professors, but in the creation of a new staff, which the institution of lectures necessarily requires; and with that limitation, do you still consider that the incorporation of lectures, upon the existing establishment, is preferable to the institution of a distinct body, by whom lectures might be given?—I think if the number of professors were increased, as it ought to be, for the necessary preservation of the Museum in its present state, that that additional number would be sufficient to supply teachers for a school, as part and parcel of the Museum.

815. Would it be your object, in one sentence, to form a Jardin des Plantes in London, in lieu of the existing system in the British Museum?—Yes, certainly.

816. Mr. *Marshall.*] Do you think it would be expedient that those lectures should be given on the two days at the Museum which are not open to the public, or on the three days on which it is open to the public?—That would depend upon future arrangements, and upon circumstances that we cannot speak to; it would depend upon the number of lectures proposed to be given; it would be utterly impossible to have, with any advantage, four or five courses of lectures going on during the same day; I mean that there should not be four or five lectures on different subjects given on the same day. A young man might be desirous of attending lectures on two subjects, but yet be unable to give up three hours in the course of one day, although he might be able to give up three hours on three separate days.

817. Would it not be very inconvenient for the present professors to give lectures on the days when the Museum is open to the public, on account of the number of the public then admitted in the room; it would be impossible to have a class attending a lecture separate from the public?—Of course the students in any such proposed school would be admitted only by tickets; and this might be accomplished with the greatest facility, as persons are admitted to the reading-room, from which the public are as much excluded every public day as they would be on the lecture days, and therefore no inconvenience would arise.

818. It then follows that these lectures must only be given on the two days on which the public are not admitted to the Museum?—I do not see why.

819. If the public are not to be admitted when the lectures are going on, the Museum must be closed to the public on those days?—If there is to be a lecture, there must be a lecture-room, I apprehend, but not in any part of the present rooms.

820. Mr. *Hawes.*] Is not the giving a lecture and the exhibition perfectly compatible, as in the Jardin des Plantes at Paris?—Certainly.

821. Mr. *Ephinstone.*] In the Jardin des Plantes there is a large lecture-room?—Yes, capable of holding 500 or 600 people; and when a good lecturer is delivering a lecture it is always crammed.

822. And no difficulty exists in bringing the specimens to the lecture-rooms?—No.

823. *Chairman.*] So that your suggestion is founded upon the notion there will be erected sufficient and commodious lecture-rooms for the use of lecturers?—Yes.

824. And that the pupils are not to be assembled in any of the rooms in which curiosities are deposited?—Certainly.

825. Mr. *Compton.*] Do you not think if professors were to be appointed to the British Museum to read lectures, that it would be better they should receive a sufficient salary from the public, rather than depend upon the pupils?—They would not work half so hard; the Gresham lectures are a very good proof of that. Some of the Committee may have had an opportunity of going there; and if it so happens, by any accident, they are detained five minutes beyond the usual time, if there are not two or three or half a dozen people in the room at one or two o'clock, whatever the time is, the door is shut, and there is no lecture that day.

826. What sort of persons are appointed to lecture at the Gresham Hall?—They are appointed by the Gresham Committee; I do not know further how the appointment is made.

827. Mr. *Bingham Baring.*] How will you subdivide the Natural History department?—I would give a keeper to each class; a keeper of the mammalia; a keeper of the birds; there should be a keeper for the reptiles, and a keeper for the fishes; then I should say there should be a keeper for the shells; a keeper entirely for the insects; and the other classes might be put together and given into the care of one person.

828. You would then have seven professors?—Yes.

829. At what salaries?—I have not thought about that, and therefore I cannot say; of course if a gentlemen is to give up his whole time to the Museum, which I consider any gentleman holding an appointment there should do, he

J. Flint South, Esq.

8 March 1836.

ought to be liberally remunerated, and not in the stingy way the present officers are.

830. Would 500 *l.* a year be an adequate salary?—I think the benefit to the public might fully warrant 400 *l.* or 500 *l.* a year.

831. Mr. *Hawes.*] Allowing in addition the emoluments from private pupils?—Yes; but they should be strictly confined to the Museum.

832. Mr. *Bingham Baring.*] Under each of those professors you would place assistants?—Yes; they might have what in other occupations are called apprentices, whom they should instruct in their own particular branch. There are a number of things to be done in every collection; and if a man is to know the real value of it, he must begin at the bottom and work up. If he is in an anatomical collection he must be content to begin with tying up bottles and dissecting before he can be competent to know the value of the things put under his charge, and so it would be at the Museum. No man can be a judge whether an animal is properly stuffed or set up, or when set up likely to stand, unless he knew something of the mode in which the thing ought to be done; all of which I hold the eléves should be engaged in learning.

833. It would be necessary to have more than one assistant in order to keep the specimens in order, and also to carry on the catalogues that might be necessary?—It would at present, because there is so much to be done; but when the collections were properly arranged and catalogued, a vast quantity of continued labour would cease. Of course at present it would require an enormous outlay of labour before the whole collections could be brought into the state that I hold they ought to be.

834. But continual additions would be making to the collection?—Yes, no doubt; but they would not come in so quickly, except occasionally when a large quantity might be presented or bought. Generally speaking, I do not think the additions would be so numerous as to give rise to any superabundance of labour.

835. What would be the permanent staff?—The seven I have enumerated as keepers, each should have an assistant, and besides that he should have a servant, a labouring person, who should do all the really dirty work.

836. An assistant, at what salary?—I should think, provided the professors had permission to take some young men, that after they are fully qualified, they might be provided for in that way, and would be glad to undertake the duty at 50 *l.* or 60 *l.* a year, and pursue their own amusements or employments out of office hours.

837. Sir *Philip Egerton.*] Do you consider that a person giving public lectures for his own emolument, according to the plan you have proposed, is, in your own words, devoting all his time to the Museum?—Yes, most certainly, because he is illustrating the collection in the Museum.

838. Mr. *Hawes.*] It would be then a condition of his holding his situation?—It would be a part of his duty.

839. Assuming the keepers of departments were men eminent in their several branches of science, do you think that the management of the Museum might be safely entrusted to such a board of gentlemen?—Most certainly they are the most competent to know the value of the collection entrusted to them; they are the best able to judge of how it may be efficiently kept up, and they would for their own credit sake devote all the attention to it which their great responsibility would then lay upon them.

Jovis, 10° *die Martii*, 1836.

MEMBERS PRESENT.

Mr. T. G. B. Estcourt.	Mr. Pease.
Mr. Hawes.	Mr. Bingham Baring.
Mr. Elphinstone.	Sir P. Egerton.
Sir R. Inglis.	Lord Stanley.
Mr. Compton.	Mr. Marshall.

MR. T. G. B. ESTCOURT, IN THE CHAIR.

Mr. *James Scott Bowerbank*, called in; and Examined.

Mr. *J. Scott Bowerbank.*

10 March 1836.

840. Mr. *Hawes.*] YOU are a Fellow of several learned societies?—Of the Geological and the Zoological Societies, and a member of the Entomological Society.

841. Have you long given your attention to mineralogy and geology?—Not to any extent to mineralogy, but to geology I have.

842. Have you a collection chiefly of organic remains?—I have a considerable collection.

843. Can you state the extent of your collection generally?—I can scarcely give an idea of the extent of any one part, except the conchological. The tertiary shells I reckoned up a few days ago, and I found that I had somewhat exceeding 420; the tertiary and secondary together exceeded 1,200; if I recollect it was 1,268; but that there are many more species I am certain, inasmuch as I have a considerable quantity which have not been arranged, and which I have not taken into the account.

844. Has the Museum any similar collection?—They have, but I have never seen any collection anything to the amount of my own. Six or eight months ago I went for the purpose of seeing again whether any of the shells were out, and I found about the same quantity out that I had seen before; if I recollect right, the amount of British shells did not exceed 160; I am certain that they did not exceed 200; at that time tertiary and secondary were together. I am not aware that there are others than what are exhibited.

845. Are they well arranged and named in the Museum?—I am very sorry to say, that not only years ago, before I belonged to the Geological Society, but of late, I have been to the Museum with the intention to make the arrangement of the British Museum the basis of that of my own collection, and was so much disappointed that I have not since made any attempt to adopt their arrangement; indeed, I have found the assistance obtained from private collections very considerably greater than that from the British Museum.

846. Then that portion of the national collection, in your opinion, is inferior to private collections, not only as to extent but as to arrangement?—If there are not a very considerable number more than what are shown, I should say it was a miserable collection. The collection of one private gentleman alone in crag shells amounts to 450 species; the person I allude to is Mr. Wood, of Suffolk. The collection of Mr. Wetherell, of Highgate, the produce of his own unassisted exertions, is upwards of 200; and he reckons that he needs 100 more species, which it is desirable he should have, to make his collection of London clay shells alone tolerably perfect.

847. Is your evidence as to shells to be confined entirely to fossil shells?—Entirely; I have never paid any attention to others.

848. Have you any reason to suppose that there is any great number of fossil shells in the Museum not exhibited to the public?—I have reason to suppose the contrary, if I recollect right, from the evidence of one of the officers, which states that there are no shells to any considerable amount which are not exhibited; I therefore take it for granted that the major part of the fossil shells at least are exhibited.

Mr. *J. Scott Bowerbank.*

10 March 1836.

849. If there be any collection in the Museum, should not some such arrangement as this be forthwith adopted, that the shells should be placed stratigraphically?—Decidedly. If I were asked my own humble opinion, I should say that all recent shells, by which term I mean shells of which you have the living animals, should be considered as subjects of zoology, whereas all shells which are found to be fossil, and there are many genera of which not even a single species is to be found in the recent state, should be considered as subjects of geology. It appears to me to be absurd to arrange the objects of one science according to the laws of another, without reference in any degree to the first science.

850. Are you at all acquainted with the Entomological department?—I have frequently visited it, for the purpose of comparing insects and acquiring names.

851. What is your opinion of that?—That the collection is very deficient.

852. As to its arrangement?—The arrangement, as far as it goes, is good; but still it is certainly deficient. If I recollect right, there may be estimated about 25,000 species in the British Museum, of which from 7,000 to 8,000 only are arranged, leaving about 17,000 still unarranged.

853. What species are most deficient?—In many of the very commonest species they are exceedingly deficient. Two genera which I recollect as exceedingly deficient are morpho and papilio; and upon receiving a case of Brazilian insects, and making reference, I found them exceedingly deficient in those also. There can be no necessity for this, as Brazilian insects are very common in the market.

854. Is the collection easily seen, and are facilities given you by the officers?—Every possible facility, as regards not only the entomological but the geological collection has always been afforded me; every information I have asked has been readily given me.

855. In speaking, then, of the deficiencies of any particular department, you attribute no fault to the officers?—Not in the slightest degree. I should say the whole of it has originated in the lamentable want of assistance in the Museum; for instance, in the Entomological department, even as it is, with about 25,000 species. The 17,000 yet requiring to be catalogued and arranged will take a very considerable time, as it requires much more time to find out the place of an insect requiring dissection of the parts of the mouth than it does to ascertain the place in the natural system of a bird or of a quadruped; and I should say if (as under the present circumstances) it should remain the work of one man only, it is absolutely impossible that that part of the Museum's collection can be arranged for many years to come; and this will be strongly evinced by the consideration that the curator has under his care upwards of 800 drawers, to keep clean, to camphor, and to examine occasionally, to ascertain that the specimens are in good order.

856. Who is the curator of that department?—Mr. Samouelle has the charge of the insects.

857. It has been stated by Mr. Samouelle that he has no one to assist him even in wiping the glasses or dusting his room; do you think that that is as it ought to be?—Certainly not; that is not the only part in which an assistant might be of great service in that department, for on receiving accessions of insects from abroad, they generally come, at least in all instances that I have seen, with the families mixed together indiscriminately, frequently stuck with needles, and occasionally with large pins; and it being absolutely necessary to remove those, the assistant might do that while the principal is attending to the more scientific part of his duty. In the same manner the assistant might make considerable advances towards the systematic arrangement of the whole, by separating the classes at least, and frequently the families.

858. Is it your opinion that both the scientific and the general utility of the institution suffers from the want of that assistance?—Its usefulness as a collection suffers greatly: indeed the Entomological collection of the British Museum is held in very considerable contempt by the London entomologists; I refer only to the number of insects, and the lamentable want of some of the commonest species.

859. Mr. Kirby has lately made a munificent present of his collection of insects to the Entomological Society?—He has.

860. Did you ever hear his reason for having made a present of that collection

tion to the Entomological Society?—I have not; but I have known of other collections being disposed of in other ways, from the belief that they would be lost at the British Museum.

861. Have you ever heard that the curator's time is very much employed by his attendance on parties?—I have no positive evidence of that, but when I have called there to make reference to the cabinets, I have frequently found him absent; and upon seeing him at a future time, I have found that he has been attending sales or engaged in other employments, and therefore I have from that, good reason to believe that his time has been taken up with other matters rather than with the arrangement of his own collection.

862. But your complaints are more against the system adopted at the Museum than against any individual?—By no means against any individual, for I have met with the greatest possible politeness, and every assistance from the officers.

863. Do you consider the collection of insects of considerable importance, both as relates to medicine and manufacture?—I consider it of considerable importance.

864. One well worthy the liberal attention of the public?—Decidedly so.

865. Sir *P. Egerton.*] You mentioned the collection of fossil shells of Mr. Wetherell from the London clay, and Mr. Wood from the crag; can you state whether those gentlemen have had any peculiar facilities, by residence in the neighbourhood of the formations where those specimens are found, for making those collections?—Certainly they have; Mr. Wood resides in Suffolk, and Mr. Wetherell at Highgate.

866. And they have had opportunities of enriching their collections which a national body could not have?—I do not say that, for I conceive a national body, such as this, has the same opportunities that individuals have; and I will explain in what manner. I will mention that, as regards myself, I am engaged in business for the major part of the year, but I devote a month in the spring to travelling about and amusing myself, and I generally go to some geological habitation, and by doing so, I have at all times collected so great an amount of fossils, that, had I sold them, they would have paid the expenses of my journey twice over. For instance, I have perhaps quite as valuable, if not a more valuable collection of Gault fossils than any collector in London; and, with the exception of a very few purchases, the whole has been the result of two short visits to Folkestone, each visit not exceeding four days.

867. How do you apply those remarks to the British Museum?—I think the British Museum should either be in correspondence with parties in those particular localities, or they should have a travelling collector. I may say that the whole of my collection has cost a very small sum of money, but it has been increased very greatly, and many very valuable specimens added by correspondence with different museums. For instance, I have opened a correspondence with the Whitby, with the Scarborough, and with the Manchester museums. I have engaged to supply duplicates, and receive specimens from Dr. Beck, of Copenhagen, and have done so likewise in many other cases with private individuals; and by those means I have gained a vast number of very valuable specimens, at the price of my own duplicates.

868. Then it is your opinion that the Museum should have a body of officers, connected with each department, travelling about the country to collect specimens, and to make exchanges with local museums?—No, I do not say that there should be a permanent officer of that description; I think that, if any one of the officers, or any party deputed by the Museum, was occasionally to travel into those districts, the Museum would be greatly benefited. For instance, I should say, if any person were to take a month's tour from hence to Christchurch, from thence to the Isle of Wight, and thence to Weymouth, that the expenses of that party might be paid (after the Museum collection had been served with the best specimens) by the sale of duplicates.

869. Then, though you do not wish to express an opinion that a permanent servant of this description should be attached to the Museum, yet you think that at certain times of the year persons should be deputed to undertake journeys for the purpose?—I think it would be highly desirable, and I think the Museum should open communications with other museums for the exchange of duplicates, by which they might very considerably enrich the collection, and at no expense to the public.

Mr. *J. Scott Bowerbank.*

10 March 1836.

870. Lord *Stanley.*] Will you explain to the Committee how this object of enriching the Museum is to be accomplished by travelling agents, and at no expense to the public?—With very little expense to the public, in this way; I am speaking now from my own experience as regards visits to the crag formation, and to those of the London clay, of the Hampshire coast, and of the Kimmeridge and Oxford clay, in the neighbourhood of Weymouth. The number of specimens I acquired, including a considerable number of duplicates, enabled me to exchange with the Scarborough and Whitby museums, and thus to supply myself with an excellent collection of lias fossils, which I should not have possessed had it not been for the vast quantity of duplicates I brought home with me. I make it a principle to collect duplicates, to act as current coin in those matters; and from having frequently attended sales of fossils, I am fully convinced, from the prices which those fossils have fetched, that the mere sale of the duplicates would go a great way towards paying the travelling expenses incurred in collecting the whole.

871. Sir *P. Egerton.*] Do you consider it consonant with the dignity of a great national collection to have peripatectic collectors engaged in procuring specimens, and in bartering with other museums, in the manner that a private collector is at liberty to do?—I should certainly say it is by no means beneath their dignity so to do. The character of a private individual is quite as dear to himself as the character of a British Museum officer would be. I appeal to every collector in London, whether they have not acquired specimens by exchanges, and I appeal to every gentleman who has so done whether he considers it in any shape beneath his dignity.

872. The question refers to the British Museum as a great national collection?—Certainly it is by no means inconsistent with the dignity of a national collection. I may mention, that on the part of the Crown Prince of Denmark, Dr. Beck has entered into an agreement to exchange specimens with myself. Under those circumstances, I should say, it would not be beneath the dignity of the British Museum. I believe the British Museum has negociated exchanges, for if I recollect right, the late Mr. Crow mentioned to me that a part of his fossil fruits were given to the British Museum, in consideration of a number of minerals received by him, which were afterwards exposed to public view in his Museum at Canterbury; it, therefore, has not been considered beneath the dignity of the British Museum to exchange.

873. Are you aware of any large collections of London clay or crag shells having been offered for sale in the last few years?—Certainly not.

874. Are you acquainted with the Saurian remains of the London clay?—That is a branch to which I have paid but little attention.

875. Have you seen the remains of crocodiles in the British Museum, from the London clay?—The last specimen of which I have any recollection was a crocodile's head, which was first offered to me by the party who had it to dispose of; I recommended him to take it to London, and show it to Mr. König, and he afterwards sold it to him for half what he had asked me for it.

876. Then it appears from that that the British Museum are not averse to make additions to the national collection, when they have a good opportunity of doing it?—Certainly not; but I consider there has been great partiality in the expenditure of the money as regards the British Museum; for by the report it would appear, that the average expenditure for minerals for five years was 586*l.* 14*s.* 11*d.*; whereas upon fossil remains the average was only 30*l.* 15*s.* 6*d.*, and upon insects and crustacea together the pitiful sum of 5*l.* 15*s.*

877. Lord *Stanley.*] Are you aware of the system according to which the annual expenditure has been distributed among those departments in the British Museum?—No, I am not.

878. Are you aware that they are all under the superintendence of the same officer?—No, I am not.

879. Mr. *Hawes.*] The opinions you have expressed are confined to the particular branches which have been enumerated in the course of your examination?—To the branches which are enumerated in the average I have mentioned.

880. Mr. *Compton.*] You were understood to say, that the collection of fossil shells in the British Museum is a very poor collection?—If there are no more than

than what are exhibited, I should say that it is a miserable collection, as a national collection.

881. Did you mean to say that you had seen only about 200?—I counted, some few years ago, the British tertiary shells; the British and the foreign are mixed together, so as to be of but little use to the stratigraphical geologist.

882. You stated that you have about 1,268 species; are those British shells?—All British fossil shells, the tertiary, including the fresh-water formations, as a matter of course.

883. Have you seen any foreign collections of shells?—I have not.

884. Sir *R. Inglis.*] Then your estimate of the British Museum collection, as a miserable collection, is founded on comparison with nothing out of England?—It is formed upon a knowledge of what is nearly about the amount of the British tertiary and secondary shells, which, I should say, by reckoning up those which are published, those in my own collection, and those in the collection of others, may amount to about 2,500.

885. Then are the Committee to understand that the expression, "miserable collection," applies not to fossil shells generally, but simply to the fossil shells purely British?—To the fossil shells purely British.

886. Can you state what, in your judgment, is the value of the collection of fossil shells in the British Museum generally, as compared with any other collection?—I should say, as a scientific reference, it is comparatively valueless, inasmuch as there are many other collections that would afford a student much more information; for instance, the series of London clay shells is so deficient, that I have in my own possession 15 or 20 species which are not in the British Museum collection.

887. Are you prepared to express any opinion with respect to the other fossil remains in the Museum?—I should not wish to give an opinion beyond fossil shells. The collection of fossil echinites, I should say, was poor; and the Museum collection of fossil British crustacea, I should say, was exceedingly poor. I have twice the number of species of these latter objects in my own collection.

888. But you are not prepared to state any general opinion with respect to the fossil collection in the Museum?—I can give no other opinion than what I have already given, that it is very inferior.

889. To what?—To the generality of professed collections in Britain. It is very inferior in crag shells to Mr. Wood's; it is very inferior in London clay shells to Mr. Wetherell's; it is very inferior, in many points, to my own collection, though in many others it may be considerably superior.

890. Mr. *Compton.*] Have you seen the collection of fossil shells at Manchester?—I have never seen it. I have seen the museum generally; but when I was there I did not go over the fossil shells.

891. Are there any public collections of shells in England superior to that in the British Museum?—I am not aware that there are. I have made no comparison between other public collections and the British Museum.

892. Then your comparison, with regard to the shells, is a comparison with private collections?—Certainly.

893. Lord *Stanley.*] And those private collections are of course devoted exclusively to one particular class?—By no means; for instance, my own collection is a general one, for the purpose of illustrating every stratum; and I should say as regards echinites, that I have many more species, some much finer than the British Museum; and I have as regards fossil Bristish crustacea, and which have cost me very little trouble, comparatively speaking, many more; as regards fossil fruits, I have ten times the amount.

894. But your collection is exclusively a collection of fossils?—A collection of fossil organic remains.

895. In the comparisons you make of the British Museum, do not you compare it with collections which are exclusively devoted to the single object of fossil remains?—The term fossil remains is a very general one, it includes every branch of fossil organic remains, which form the general object of a geological collection; indeed, I consider them as purely geological, for a collection merely of specimens of the different strata, would be comparatively valueless without them. It is the fossil organic remains which identify the strata.

Mr. *J. Scott Bowerbank.*

10 March 1836.

896. Sir *P. Egerton.*] You confine your observation to the British specimens?—To British specimens.

897. Will you state, as a practical geologist, whether you consider that the student of geology would find it more advantageous that the organic remains should be detached from the geological collection or not?—That is perhaps rather a difficult question to answer; it is exceedingly necessary that both the shells and the specimens of strata should be in the same museum. But if I were asked my own private opinion of the mode of arrangement, I should say, for convenience sake, the two collections should be arranged separately, but they should be in the neighbourhood of each other, and readily accessible.

898. Then you do not agree with Mr. Sowerby in thinking that the geological collection should be attached to the mineralogical collection, and placed under the mineralogical curator, instead of being arranged with the collection of organic remains under a separate curator?—I certainly disagree with Mr. Sowerby upon this point. I consider that Mr. Sowerby, for special purposes, has been called upon to arrange his own museum zoologically. The first commencement of Mr. Sowerby's father's collection was as a collection of shells, it afterwards took a more strictly geological form.

899. Mr. *Elphinstone.*] You were asked just now with reference to the supposed dignity of the officers of the Museum; do not you think it should be their main object to make the collections in their charge as perfect as possible?—Decidedly so.

900. Would you think it derogatory to their dignity if they were to endeavour to exchange duplicates with other museums, or with private collectors?—I should certainly not think it derogatory to their dignity to make such exchanges; for instance, if it were known that the British Museum was open to such exchanges, private collectors would naturally say this: "I have a vast quantity of duplicates from such and such strata, which may be of use to the Museum;" they would make an offer to the Museum, and as duplicates are generally considered as current coin between collectors, of course, the Museum would be expected to give such specimens as might be of service, and as near as may be equivalent in value to the specimens given. I should certainly consider such an exchange by no means derogatory to the Museum. If I may be allowed to make one observation as regards the Museum, which is, that I think the placing the collection of geology under the head of mineralogy, and making it a subordinate department, is not doing it justice; for I consider, that however talented Mr. König, or any other gentleman having the care of the minerals may be, it is impossible for him at the same time to devote his attention to so extensive and valuable a collection as the mineralogical collection, and at the same time to do justice to the geological one. I should say that it requires a separate head for that department; the Geological Society have three persons who attend to the interest of their library and collection, and in the National Museum it would at least require one.

901. Lord *Stanley.*] But, in fact, there has been in the British Museum nothing like an attempt to make a stratigraphical arrangement?—Not that I am aware of.

902. That has not entered in any way into the arrangements of the British Museum?—I am not aware that it has; I have seen the most distant formations mixed together.

903. Would not such an alteration in the present system involve a very extensive alteration of the whole internal arrangement of the Museum?—I think not; for the arrangement of the fossil remains has gone forward to so small an extent, that it would be very little trouble to re-arrange them stratigraphically.

904. Mr. *Elphinstone.*] Are you aware how many specimens there are in the possession of the Entomological Society?—I am not; but I may give an idea of the number of insects which may be got together in a short time, by stating, that there is a little entomological club, which has consisted of 12 members, not more than half of whom are practical entomologists, and this little society has within three months past formed a determination to have a cabinet collection of their own, and there are already in that little cabinet upwards of 5,000 species and more than 20,000 insects.

905. Mr. *Hawes.*] Do you know the expense incurred in forming that collection?—They are all donations.

906. Lord *Stanley.*] You prefer that there should be a stratigraphical arrangement

rangement to a geological arrangement?—I should say, that if it be meant that the fossil shells in the British Museum should be appropriated to the study of the conchologist, that they should be arranged zoologically; if it be meant that they should be dedicated to the services of the geological world, then the primary arrangement should be stratigraphical; and the secondary arrangement, that is, of each particular department, should be zoological.

907. But supposing the zoological arrangement to be adopted in that case, have you any complaint to make as to the manner in which they are arranged in the Museum?—They are scarcely arranged as yet. I do not complain of the work done, but I complain of there having been scarcely any work done; and the principal subject of complaint is, that as a geological collection they are comparatively useless to the student. The collection of the Geological Society, though it be not named throughout, is highly valuable to the student, from the circumstance that the fossils are collected into groups, according to their strata, and not according to their zoological characters.

908. So far as it has proceeded, do you find any objection to the arrangement of the fossils in the British Museum, supposing the principle to be adopted of a zoological arrangement?—I should say there is a great deficiency of names.

909. Sir *R. Inglis.*] By names, do you mean the labels?—The labels. I have not viewed carefully the collection for some months, but when I last saw it there were many shells without labels, and some which appeared to have the names written; but the labels were doubled up and not to be read. Many shells were without labels, that were well known to practical geologists, and which might readily have been named. But I by no means wish to impute blame to the curator; I consider it absolutely out of his power to pay the required degree of attention to them, while he has the splendid collection of minerals to look after.

910. Lord *Stanley.*] You are confining your attention entirely to fossil shells?—Entirely, at present; but the great body of fossil organic remains, the family of echinites, for instance, have not been displayed for many years; nor do I know that the students could make any great use of them, inasmuch as they are not named.

911. Are you aware whether the actual accommodation in the British Museum admits of their being arranged?—No, I am not aware of that; but there have been many cases standing in the British Museum, covered over with paper, which might as well have been shown to the public, although not named or arranged.

912. Sir *R. Inglis.*] None of these remarks apply to the larger remains of the mammalia and the sauria?—No, they have been arranged with great taste and judgment; they are gems, of which we need be proud.

913. Mr. *Elphinstone.*] From your knowledge of the number of known specimens of fossil shells, could you give the Committee an idea of the space that would be required to exhibit a perfect collection?—It would require some calculation to give an idea; but there is a space in the sides of the long room which appear to be already appropriated to the British fossil shells as far as they go, and I should consider that the space up and down the sides of the long room would be sufficient to exhibit the whole in proper cases.

914. Then you consider that that room is sufficient to exhibit a perfect collection?—Of the fossil shells, I should imagine so, but I beg that no great value may be attached to this opinion. My own collection is in drawers about two feet square, and the specimens are, many of them, piled upon one another; for I have filled 100 drawers with it, and I suppose it would require nearly 200 to display them properly.

915. Mr. *Hawes.*] Can you give the Committee any idea of your own annual expense in forming your collection?—If I am to include my travelling expenses, I should say that the whole of the annual expense has not exceeded 80*l.* a year.

916. For how many years?—For about 10 years that I have travelled for that purpose.

917. Sir *P. Egerton.*] Are you well acquainted with the family of the ammonites?—I am tolerably acquainted with them.

918. Are you aware that some specimens are as much as three feet in diameter?—I am.

Mr. *J. Scott Bowerbank.*

10 March 1836.

919. You are aware of the vast number of species that are contained in that family?—Perfectly. I have a vast number in my own possession.

920. And yet you are of opinion that there is sufficient accommodation for exhibiting the whole of that family, with the other fossil shells, in the British Museum?—With more upright cases for disposing of the large specimens, I should think there would be sufficient space.

921. Then your former remarks cannot refer to the family of the ammonites?—The number of large British ammonites would not be very great, I mean such ammonites as it might be necessary to arrange against the wall in upright cases. The Portland oolite would afford but very few specimens of large ones; the Kimmeridge clay also affords but few, and the Oxford clay scarcely any much larger than the base of the inkstand, *i.e.* four or five inches. The largest ammonite I have seen from the lias has not exceeded eight or ten inches in diameter, and the largest from the Malton oolite does not exceed 14 inches. I am not aware of any very large ones, except those from the Portland oolite.

922. Then, do you mean that you are not intimately acquainted with the species of that family?—I have not paid particular attention, but I have by me many hundred ammonites, some of them very rare, but very small; all the Gault ammonites are small; and I have seen none from the chalk that would exceed two feet.

923. Mr. *Hawes.*] Have you had occasion to frequent the library of the Museum?—Occasionally, for many years.

924. Do you find your studies facilitated by a good classed catalogue in the reading-room?—I find, if I go prepared exactly with the name of the author of the work I want to see, that I can get it readily; but I should say that a classed catalogue is indispensably necessary as an addition to the present one. I have made many attempts to learn the number of works in the British Museum that have been written upon certain subjects, but I can form no idea of them, and I believe it to be morally impossible to gain such information from the library itself.

925. Do you think it desirable to depend entirely upon the librarians for information upon that subject?—I by no means think it a good plan that dependence should be entirely placed upon the librarian; for, with a vast number of persons attending the British Museum, there is a natural disinclination to trouble the librarian upon the subject. Besides, as ideas arise in reading, a man might be continually running backwards and forwards to the librarian to inquire upon the subject. As the catalogue is at present, I should say it was very considerably less useful than it might be made.

926. Have you seen Dryander's catalogue of Sir Joseph Banks's collection?—I have; and a most valuable work it is, so far as it goes.

927. Has it rendered the whole of his library accessible to the student?—Decidedly; but there are an infinite number of works since the publication of that which it is desirable should be seen.

928. Was there not a catalogue of the natural history books in the King's Library?—I am not aware of it.

929. Supposing such a catalogue were formed of the whole library in the Museum, but sold in parts, so that students might each purchase their own part, do you think such a work, in a pecuniary point of view, would be very costly to the nation?—I cannot form a correct idea of the cost; but I should think such a catalogue would not cost a vast deal of money. For instance, I once took some little pains with a catalogue, to select and classify the different natural history works, to mark them down the side of the catalogue with an indication of the particular class to which they might be referred, and I found that I could readily do about 40 in five minutes; and it struck me upon that occasion, that if a man, thoroughly competent to classing, was to go over the present catalogue, placing letters against each title to indicate the particular department, and 10 or 12 booksellers' catalogueing clerks were to follow, each taking his department, that such a work might be got over with facility at least within 12 months.

930. If sold in parts, do you think it would meet with a sale?—I should think it would, decidedly; speaking from my own case, I should be sorry to be without it.

931. Would it not have also this advantage, that it would point out the comparative poverty and richness of the Museum collection?—Certainly it would;

would; and great advantage would result if the same thing were carried into effect as regards the fossil organic remains, and other branches; it would very considerably enrich the Museum. Strangers going over the Museum at present, and not aware that the whole of the collection is exhibited, would naturally trouble their heads very little as respects making donations; but if they knew that the whole was exhibited before them, I think they would present duplicates with great readiness, particularly if the donors' names were always attached to such specimens.

932. What do you think of the judgment which should dictate the continuation of an extensive alphabetical catalogue, and the giving up the formation of a class catalogue?—I should say that the party who came to that conclusion was by no means aware of the wants of the natural history student, or of the general scientific reader.

933. To you personally in your researches, what would be the comparative value of an alphabetical catalogue, and of a class catalogue?—The value of a class catalogue would be very great. I will put it in this light: that a student of a certain given branch of natural history is very desirous to know what works are written upon the subject; he would gain that information immediately if there were a class catalogue; but, under the present circumstances, there are vast numbers of works in the British Museum, which would be, from the present state of the catalogue, entirely lost to him.

934. Are you acquainted with the Synopsis of the Museum?—I am not; I referred to it years ago, but it did not give me the information I required, and therefore I have not been in the habit of using it of late.

935. Lord *Stanley*.] Have you had much experience in the formation of catalogues of very extensive libraries?—No, I have not.

936. Then you are unable to speak either as to the time it would require, or the expense it would incur, or to state more than your own opinion, that it would be desirable if it could be obtained?—I am unable to speak further than this: that from the slight attempt I made to classify an ordinary bookseller's catalogue, and from finding that I could readily classify at the rate of 1,000 a day, I came to the conclusion that any party, working in the same manner as myself, might classify 1,000 works a day; and that at that rate the classification might be achieved in about 34 weeks, supposing 200,000 works to be numbered.

937. But that sort of classification you attempted was a mere transcript from a perfect catalogue?—It was going through the catalogue and marking Z against Zoology, C against Conchology, and so on.

938. Then before you began that class catalogue it would be necessary to have a complete catalogue, with all the titles accurately taken down, in whatever order, and with bibliographical notices attached to them?—It would certainly be necessary to have an alphabetical catalogue of that description, or to proceed from the books themselves.

939. Then before you proceeded to the class catalogue you must have the foundation laid by a much more laborious and extensive undertaking?—Certainly; you must have an alphabetical catalogue before you can proceed on the principle I have mentioned.

940. Then how do you reconcile that with your former answer, in which you express your dissent from the opinion of those who imagine that it might be desirable to have a complete alphabetical catalogue before they proceeded to form a class catalogue?—I beg it to be understood that I do not object to an alphabetical catalogue; but I say that a classed catalogue in addition is highly desirable, if the greatest use be intended to be made of the library. I beg leave to say, in explanation of my former answer, that I by no means meant to say that the alphabetical catalogue should not be continued, but that any party who should say that an alphabetical catalogue was necessary, and a classed catalogue not, was by no means acquainted with the wants of the student.

941. Then the Committee are to understand your former answer as applicable only to the case of the class catalogue being totally abandoned, and not its being postponed till a complete alphabetical catalogue should be made?—I was not aware that a complete alphabetical catalogue had not been made; but I should consider that it could never exist in a state of perfection, inasmuch as the continual accession of new works would render it always in progress.

942. Sir *R. Inglis*.] Does not that answer apply equally to the formation of a class

Mr. *J. Scott Bowerbank.*

10 March 1836.

a class catalogue; namely, that whether the books are arranged according to their class, or according to the alphabet, continued accessions will render the work imperfect?—It would render it not entirely complete; but I mean that it does not stand to reason that because we cannot have a classed catalogue entirely finished, that we should have no approximation to it at all.

943. Lord *Stanley.*] Your idea of the facility of making a class catalogue is founded upon the mere supposition of extracting certain titles previously arranged in a different manner, and forming them under new heads?—When I made that observation I attached little importance to it myself; I said, that from having made an attempt at it, my idea was that it would be completed in a certain given time; that I could go through about 1,000 a day readily, and that at that rate it would be completed in about 34 weeks, supposing 200,000 works in the library. I wish no weight to be attached to my opinion as to the expense of a class catalogue; but the necessity of it is another matter.

944. In speaking of the formation of the classed catalogue, did you mean more than a transcript of a previous catalogue, with a different arrangement?—My idea was a transcript of the present alphabetical catalogue into a class catalogue, and the continuance of that class catalogue, as a matter of course.

945. Sir *R. Inglis.*] You stated that you could do 40 titles in five minutes from a printed catalogue?—Yes, from a printed catalogue.

946. Mr. *Elphinstone.*] Even admitting the present alphabetical catalogue of the Museum to be imperfect, you think it desirable that that should be converted into a class catalogue as far as it has gone?—I should say that, perfect or imperfect, a class catalogue should be made, rendering the classification as perfect as possible. I will instance the value of it in the high estimation in which Dryander's catalogue is held. Mr. South stated to me, that he had bought Dryander's catalogue a short time ago, and had given five guineas for it. Now a work of that description must be held in high estimation to command such a price.

947. Are you aware of the time which it has taken to make the class catalogue of the Royal Society?—I am not aware of that.

948. Mr. *Hawes.*] Your opinion is, that the library is not so useful as it might become if there were a good alphabetical and class catalogue in it?—By no means so useful.

949. Are you able to state any reasons why such catalogues should not be formed simultaneously?—I have given but a small share of consideration to the subject, but I see no reason why they should not be formed simultaneously.

950. Supposing even the expense to be considerable, looking at the Museum as a great national library, do you think that ought to deter the Trustees from endeavouring to form such catalogue forthwith?—If it be worth while to purchase the books, it is worth while to make the best catalogue of them; and if the library is to be useful to men of science and to students, it is worth while to give them every facility for making use of it.

951. Do not you think it would be sound economy to make the two catalogues together; might not the class catalogue be carried on together with the alphabetical catalogue, even with good economy?—I should imagine so; but not having given sufficient consideration to that branch of the subject, I cannot give a decided opinion; but I should think that the two might go on together with great advantage.

952. Supposing you were called upon to form an alphabetical and class catalogue of an extensive private library, would you not at once connect them, and form the two together?—Certainly I should.

953. Both with reference to time and expense?—Certainly.

954. Mr. *Baring.*] How would you proceed?—Very simply, by doubling the slips. I should have two persons to write instead of one, and appropriate one of the slips to the classed catalogue, and the other to the alphabetical one. This undertaking, as a matter of course, would require many hands, but in a case of this sort it is merely a question of expense.

955. Sir *R. Inglis.*] Are you acquainted with any class catalogues of any foreign collection?—I am not.

956. Are you acquainted with any foreign library?—I am not. I speak from my own feelings, from the inconvenience I have felt in not having a class catalogue

catalogue up to the present day, and from the great convenience I have received from applying to Dryander's catalogue.

957. Lord *Stanley.*] You speak with reference to the great advantage of having a class catalogue, without any reference to the time and expense it would require?—I cannot enter into those points; I speak as to the absolute necessity to the student of a class catalogue.

958. Of course, in an institution like the British Museum, you would desire that the class catalogue should be as perfect as possible?—Of course, the more perfect the more valuable.

959. Mr. *Elphinstone.*] But even if it were imperfect, you would rather have an imperfect class catalogue than none at all?—Undoubtedly.

960. Mr. *Hawes.*] Because, by having it once begun, the imperfections would be discovered, and it would be improved?—As a matter of course, if you could not find 10 books you required, you might find five.

961. *Chairman.*] You do not mean to say, that an individual could perform the work of making a class catalogue with the rapidity you talked of, when you said you could do 40 in five minutes?—I could mark 40 off in five minutes in the catalogue; the rest would be the transcribing.

962. Can you say what number of clerks it would be necessary to employ, in order to keep up with you in the performance of that work?—I cannot give an idea upon that subject; but I should say, that is a matter of no moment; if it required 10 clerks to do it in 10 days, 20 clerks would do it in five days.

963. Mr. *Elphinstone.*] You would require nothing but common copying clerks?—Booksellers' catalogueing clerks would be the most efficient men, as it is their business.

964. Lord *Stanley.*] You stated that you have marked off 40 titles in five minutes, picking out those works which had reference to natural history?—I went down the catalogue in this manner: where it was literature, I put an "L;" where it was geology, a "G;" where it was zoology, a "Z" if it was a particular zoological treatise, for example, Mammalia, I put "Ma." I put a designation which I should understand myself immediately.

965. Do you mean to state that, supposing you had a complete catalogue of the works of the British Museum, you would be able to distribute them scientifically and correctly into all the different classes, at the rate of 40 titles in five minutes?—I do not say with perfect correctness; as a matter of course, I should be liable to error; but the more practice, the more facility would be gained; but I mean to say I could mark off readily 40 titles in five minutes.

966. When the class catalogue, formed by that mode of proceeding, came before the public, do you think it would be in a state to be very creditable to an institution like the British Museum?—I cannot answer that question; that would depend upon the care used by the officers; but supposing only 20 titles are done in five minutes, it would be done within a twelvemonth then. But I proceed upon the principle that it would be better to have a class catalogue, even with some imperfections in it, than to have none at all.

967. Mr. *Hawes.*] And you think a class catalogue is equal in importance to the formation of a library?—Certainly I do; I think it essential to the scientific reader of the British Museum.

968. Sir *P. Egerton.*] You think you have sufficient confidence in your own decision to be able, at one glance, to arrange books under the particular head under which they should appear?—I beg it to be understood, that in the commencement of this part of the subject I stated that there was no great amount of value to be attached to a momentary attempt of this description. I cannot attempt to give an accurate analysis of the quantity of errors that might occur on the quantity of work that might be done; I merely give it as an approximation.

969. Mr. *Hawes.*] Your object in giving this evidence is generally to state your opinion of the importance of having good catalogues, both alphabetical and class?—Certainly.

970. It would very much contribute to the convenience of the student, and be very useful to science generally?—Certainly.

971. Mr. *Marshall.*] Supposing you had been making a class catalogue in the British Museum, would you not have been obliged to take a greater number of heads than you took in what you did for your own private use?—Most likely.

972. And, therefore, it would have taken you more time?—Very probably it might.

Mr. *J. Scott Bowerbank.*

10 March 1836.

973. Mr. *Hawes.*] As to the hours for the use of the library, do you think they are advantageous to the public generally?—To the man of leisure they are advantageous; but to the student, I should say that much more use might be made of the library, and with great effect, if the hours were extended. A very considerable number of the London scientific men are men engaged in professional or mercantile pursuits, and it is totally out of their power to make that use of the library which should be made of such a library. For instance, I have at present a list of 21 works, which I wish to refer to; they have accumulated to that amount in consequence of my mercantile pursuits rendering it utterly impossible for me to attend and consult them. If the library was open in the evening I should be enabled to do so.

974. You would recommend then extending the hours, as well as opening the library in the evening?—Certainly; I should think it advantageous to the public.

975. Do you think that ample security might be taken against fire, and against the misuse of books in the evening, as well as in the day?—I see no reason why they should not be quite as safe in one case as in the other; and, as regards the case of fire, I should think the admission of gas to the reading-room, if the pipes were not hidden, would be quite as safe as the present mode of heating the establishment.

976. You see no objection practically to it?—None whatever.

977. Speaking as a student, or as a man of science, you see great advantages in it?—Very great advantages.

978. Are you at all acquainted with the present constitution of the Museum?—No, I am not to such an extent as to give an opinion upon the subject.

979. What would be your opinion as to giving scientific men a greater share of influence in the management and direction of the affairs of the Museum?—I should imagine it would be very advantageous to the Museum.

980. Are you aware that, at the outset of the Museum, scientific men bore a larger share in the management of the Museum than they do now?—I have heard so, but I have not paid any attention to that part of the subject.

981. Do you think that if the leading geologists or the leading naturalists of the day had a seat at the board, any practical inconvenience would arise, or that the collection would in any way suffer from their influence?—I should think that great practical convenience would arise from such being the case. I fully believe that the assistance of first-rate men in those particular branches of science would be highly valuable to the Museum.

982. Would you recommend a further subdivision of the departments?—I think I stated that it would be highly desirable that mineralogy and geology should be divided.

983. Would you make the heads of such departments independent of each other, though responsible to some superior authority?—Fixed in their own departments, and independent of each other, though responsible to superior authority.

984. Do you think that to attach the giving of lectures to the office would be advantageous to the public?—Certainly advantageous. I think it was Bishop Watson who made the observation, that if he wished to acquire a science he wrote a book upon it, or that the best way would be to write a book upon it; and in the same way, if you wish to acquire a science, you cannot do better than to lecture upon it.

985. Sir *R. Inglis.*] Much to the advantage of the first pupils?—I believe the lecturers frequently gain more advantage than the students do; it compels them to read, and it compels them to be acquainted with every part of the science.

986. Mr. *Hawes.*] Do not you think a national collection might receive great extension and improvement, if the Government were more directly to assist in furnishing objects for exhibition, by calling upon the consuls and other diplomatic agents abroad to assist them?—Certainly.

987. Do you think there would be any objection to that?—I can see none; the mere having an acquaintance in the colonies has benefited my own collection considerably. For instance, a short time ago I received from a gentleman who has not been, I think, three years in New South Wales, from the neighbourhood of Sydney alone, to the amount of five trays or cases of insects, and

two

two out of the species that I received were new to this country, and Mr. Curtis also stated them to be new to the cabinets of Europe.

Mr. *J. Scott Bowerbank.*

10 March 1836.

988. Sir *R. Inglis.*] You have stated that you think it would be desirable that the leading men in the different branches of science should have a seat at the Board of Trustees for the purpose of giving assistance with respect to the purchase of collections; are you aware that the leading men connected with the different departments of natural history in the Museum have it in their power to recommend the purchase of collections?—I have understood that they have it in their power to recommend the purchase of collections; but at the same time I see no reason why the Museum should not receive great assistance from leading scientific men being Trustees; and, indeed, I think it would be highly advantageous to the Museum, upon the broad principle that they who conduct the business should understand the business.

989. Do you consider that the conduct of the business in the Museum depends essentially upon a personal knowledge of every department of science upon the part of the Trustees, as distinct from the curators?—I consider that the Trustees, having a competent knowledge of natural history, would greatly facilitate the labours of the officers of the Museum in that department, and it would prevent that occurring which probably has taken place heretofore, viz. that when applications have been made for the Museum to purchase particular collections, such applications would possibly have been attended to, and the collection bought; whereas now, in very many instances, they do not appear to have been purchased.

990. Are you aware of any collection recommended by a gentlemen at the head of a particular department having been refused, and the grounds of such refusal?—I have been given to understand, but I do not speak from positive authority, that insects have been offered to the Museum which would have been highly desirable to the collection, but which have been refused.

991. The question refers, not to whether collections of insects have been offered to an individual connected with the Museum, but whether collections of insects, for instance, which the chief officers of the department to which they have belonged, have recommended to be purchased, have not been so purchased?—I can say no more upon that head than from mere conversational report. I have been given to understand that insects have been offered to the Museum, and that they have not been purchased for the Museum. What I mean to imply is, that if there were any of our first-rate entomologists upon the Board of Trustees, it is most likely that that would not have happened.

992. *Chairman.*] Are you aware upon what grounds those insects were refused?—No, I am not.

Robert Edmond Grant, M. D., called in; and further Examined.

993-4. Mr. *Baring.*] You are a Professor at the London University?—I am a professor of the London University, in so far as a letter from the authority of Mr. Brougham, who was then at the head of the council of the University, has designated me as such.

R. Edmond Grant, M.D.

995. Are you acquainted with the present constitution of that body?—I am tolerably acquainted with the constitution of the London University, its council and management.

996. How is its constitution organized?—The proprietors have elected a body denominated the Council, who regulate the affairs of the establishment, for their benefit and the benefit of knowledge generally. That council has appointed teachers of the various departments of knowledge which they have determined shall be taught in the University.

997. What part do the professors take in the management of the University?—They take no part in the management of the University beyond what immediately concerns education.

998. Have they anything to do with the distribution of the funds of the University?—Nothing.

999. Have they anything to do with the selection of the professors?—They recommend, when the council apply to them, gentlemen whom they think worthy of holding that office.

1000. Do they regulate the distribution of money for the purchase of collections

R. Edmond Grant, M.D.

10 March 1836.

lections for the museum, or of books for the library?—The sums appropriated to them respectively for such objects they expend according to their judgment.

1001. But that appropriation is made to them by the council?—Yes.

1002. Do you think it would be according to the wish of the professors that any of their body should sit at the council board?—I cannot precisely say with respect to the general feeling of my colleagues upon that subject; but I should think that it would be highly injurious for any professor to sit at the board of council, and interfere in any way with the general management of the affairs of the University, excepting in what relates to education.

1003. What objection should you conceive there could be to any such plan?—I conceive that it would tend very much to lead the minds of the professors away from their proper business of education, and to engage them in other concerns, which can be more disinterestedly managed by a body superior to themselves than where they are personally interested; it would be disadvantageous to allow them the power of having their minds occupied with matters not relating to education.

1004. Do you think it would tend to the harmony and peace of the society of professors?—I think it would tend greatly to produce discontent and prejudices among the professors to allow one or more of them to have any share in the general management of the institution, or to have any power of directly interfering with their colleagues in the discharge of their duties.

1005. Do you think there would be the same objection to the admission of the curators or heads of the departments in the British Museum into the number of the Trustees?—Most undoubtedly; precisely the same grounds there would be for opposing such an admission.

1006. In your last examination, in question 313 in page 28, there was a passage read to you from the Memoirs of Sir Humphrey Davy; do you conceive that in that passage Sir Humphrey Davy has expressed an opinion contrary to that which you have just given?—I do not perceive that he has in that extract distinctly expressed an opinion contrary to that which I have just given; I think he may have meant, in that passage, the general introduction of ornithologists, mineralogists, entomologists, zoologists and other men of science as superintendents or as directors, or in some way to watch over the interests of those several departments of science, without meaning expressly that the officers of the British Museum were to be placed as Trustees to direct the whole concerns of the establishment.

1007. Do you understand him to mean, that men of the highest distinction as to scientific character should be admitted upon the council of the Museum, or merely that they should occupy the most exalted offices as curators of the collections, either as zoologists, ornithologists, entomologists or mineralogists, under the Trustees?—If he mean, in that extract, scientific members of the Board, they would not be under the Trustees unless as a committee of the Trustees; but as a committee of the Trustees such men would be of immense benefit to the institution.

1008. Do you mean, then, that they should be employed by the Trustees as a sub-committee of their own body?—As a sub-committee of their own body, to watch as curators; for example, as a zoological committee over the interests of that department of science.

1009. Do you suppose that men of the highest scientific attainments would be willing to take the charge of the several departments in the Museum, if sufficient consequence were given to those situations by salary, and by the confidence which was reposed in them?—I think that men of science would have other motives besides those alluded to, from the general wish to promote their favourite department of science in their native country, and to assist in directing a great national establishment devoted to such departments of science. The Zoological Museum of Manchester, I understand, is regulated by committees of the Zoological Society to which the museum belongs; four, for example, for quadrupeds, four, perhaps, as ornithologists, four entomologists, four conchologists, without salaries.

1010. Lord *Stanley*.] You are a professor of natural history at the London University?—Comparative anatomy and zoology.

1011. You at present act under the directions of the council, they of course taking your opinion as to that which is most desirable to be done in those branches over which you immediately preside?—Yes; I act under the direc-

tion

tion of the council, and have always found them willing to follow my suggestions for the improvement of the departments under my charge.

1012. Then, in fact, they do take your advice, although not as a member of the council, but practically with regard to your own department?—I have always found them enter warmly into the interests of my department, and to the utmost extent of their power they comply with my wishes when they are decidedly for the good of the departments intrusted to me.

1013. You have not felt the want of having any person in the council, especially and intimately connected with those different subjects which come under your immediate superintendence?—I may say that I have found it advantageous to be acquainted with gentlemen on the council of the University who were interested in the science intrusted to me, they then could devote time and attention to investigate what was advantageous to my department, and perhaps aid the council by such information in their deliberations.

1014. Would you have thought it an advantage to you in your own department, supposing it had been made a necessary principle of the constitution of the council that there should be in the council some persons practically conversant and scientifically acquainted with zoology and comparative anatomy?—I should conceive it a very great advantage to the council to be in a great measure constituted of persons who are conversant with the various departments of science taught in the University.

1015. Do you conceive that the council would be inclined to pay more or less attention to your opinion upon those particular subjects if there were in the council another gentleman as the representative of those same branches of science?—I think in a former answer I have mentioned that I have always found it advantageous to be acquainted with gentlemen upon the council who were conversant with my own departments.

1016. Besides the professor of natural hisory, if there were also a councillor of natural history, do you think the council would apply for advice to you as the professor of the natural history department, or to the councillor who was the representative of the natural history department?—My communications with them would be facilitated, for I have actually found from experience that when there were gentlemen conversant with natural history upon the council, I had more advantages in making applications to the council than when such gentlemen were not there.

1017. Then you conceive that it would be desirable that you should have over you in the council a gentleman intimately conversant with that particular branch to which you belong, who should represent the interests of that branch in the council?—I have always found it advantageous in my department to have gentlemen in the council, who are necessarily my superiors, who were conversant with my departments. I might name some Members of Parliament intimately acquainted with natural history, who have actually been my superiors in the council of the University.

1018. The question applies to the necessary presence in the council of some professionally scientific man, devoted to that branch, for the purpose of superintending the interests of that particular branch in the council; do you conceive that that would be of advantage to you, being placed under the council; or do you conceive that there would be any risk of feelings of jealousy and rivalry arising between two gentlemen so circumstanced?—I should always conceive it a great advantage to have upon the council gentlemen intimately conversant with my department, whether they were professionally so, or from taste; and that any wants might then be more readily perceived, and perhaps more interest might be taken to have them supplied, than if such eminently qualified gentlemen were not upon the council.

1019. You still confine yourself to a general interest in that particular branch to which you apply; but the question is, whether you think it desirable that you should necessarily have the most scientific person in your branch of science, as a member of the council, for the purpose of superintending the interests of that particular science; or whether you would be satisfied, being yourself at the head of the particular department, with being consulted by a board of gentlemen, of general acquirements, some of whom took an interest in your pursuits?—I should always be charmed to find that gentlemen, who were the most scientifically acquainted with the departments under my charge in the University, were members of the council, knowing that they would be eminently

R. Edmond Grant, M.D.

10 March 1836.

qualified to aid the council in their deliberations on such matters; and that, from the interest they took in those departments, and from their acquirements in those departments, they would look with a kindly and skilful eye into the wants and requisites for the due discharge of my duties.

1020. Mr. *Baring*.] Should you like, in the council, that each professor should have his department represented?—I think it would be very desirable, if it is not done.

1021. In that case, would not the same schism which you would apprehend from confiding the management of the institution to the junta of the professors, take place in the body of the council?—I should think not, because that council, being elected by the general body of the shareholders of the University, and having the pecuniary interests of the University to manage only for their constituents, they could not have the same motives which professors might have, whose personal interest is so much concerned in conducting the affairs of the University. There could scarcely be any selfish motives which would influence them to form parties, which might, however, readily exist among professors under such circumstances.

1022. Is not the zeal for the promotion of the particular science to which he devotes his time as strong a consideration in the mind of the man of science as that of money?—Undoubtedly; although few have a more acute perception of what relates to their own interest than men of science often exhibit.

1023. And your objection to the management of the University being entrusted to the professors arose out of their being personally and pecuniarily interested in the distribution of the funds?—In a great measure from their personal interest being concerned, and from the probable consequences of that interfering with their professional duties.

1024. And you allow that men of science, forming a part of the council of the University, would be as much influenced by their attachment to the peculiar branch of science which they have followed up, as the professors would be by pecuniary interests?—A member of the council, who was eminently conversant with a department of science, and who could have no pecuniary interest to bias his mind one way or another in his decisions, could only be influenced by a regard for his own character and reputation, and by his zeal for the promotion of that study to which he was attached; and these would lead him to give an unbiassed judgment, and to the best of his ability, upon every question that presented itself. I mean to say that his decisions would be free from all selfish or pecuniary interest, and that he could have no personal object to lead him to adopt improper means for the promotion of that department.

1025. Would you allow that he might have his mind as much disturbed by partiality to the peculiar branch to which he had devoted his attention, as the professor's mind might be disturbed by views of pecuniary interest?—I scarcely think that he could ever have the same degree or kind of motives that the professor might have. A professor might naturally feel very anxious that his department should be the most conspicuous, the most important and the most flourishing in the University, but I cannot conceive that the other could be expected to have the same strong feeling towards its exceeding the due limits in the University that the professor might naturally have; it would be a greater error in his judgment.

1026. Would not a very distinguished chemist be disposed to give inordinate preference to chemistry above other sciences in education?—I think he would be more acquainted with the real relations of chemistry to general education than perhaps any other member of the council, and give a better judgment in all that related to it, without supposing that, in consequence of this superior knowledge, his judgment would be biassed to the prejudice of the whole in favour of that department: I do not think it follows as a necessary consequence.

1027. Mr. *Compton*.] Do not you think that a gentleman who had received a liberal education, and possessed considerable taste for literature and science, would be a better Trustee of the British Museum than a person who is merely a professional man in any one department of science?—I think that most undoubtedly a gentleman who was profoundly conversant with any department of science would be a more valuable Trustee of the British Museum, in reference to that department, than a gentleman of merely general education. I think a gentleman of general education would not be more useful as a Trustee of the

British

British Museum than a gentleman who was distinguished for his great professional acquirements in some particular department of the Museum.

1028. Do you think that the whole of the Trustees of the British Museum should be composed of professional gentlemen?—Never; but that there should be a due proportion of gentlemen who were intimately conversant with the departments of science relating to the British Museum, and of other noblemen or gentlemen who from taste took an interest in the affairs of science.

1029. Do not you think, that in your department, any suggestions made by you to the Trustees of the British Museum, such as have been described, would be likely to have as great an effect with them as if there was a professional gentleman amongst the Trustees?—Not always; their minds might be often harassed by applications from the different departments of the British Museum, with all of which they were partly acquainted, but not intimately with any, and therefore they could not sufficiently perceive and weigh in their minds the real value and importance of the several applications, to enable them to give a judgment so well founded as a gentleman would be able to give who was profoundly acquainted with that department.

1030. Is not that answer almost a reason for not having professional gentlemen as Trustees; would not the general advantage of the establishment be better consulted in consequence of not having professional gentlemen as Trustees?—I have just said in my last answer, that I thought it would be a greater advantage to have a gentleman profoundly acquainted with the department of science as a member of the body of Trustees than to have a mere gentleman of general knowledge.

1031. Lord *Stanley.*] You are acquainted with the divisions of the British Museum?—Partly.

1032. How many departments of the British Museum would you consider it desirable to have directly represented upon the Board of Trustees?—All the departments which it embraces.

1033. Will you have the goodness to enumerate them?—I have stated that I am not acquainted with all the departments of the British Museum.

1034. Taking the leading branches, have the goodness to state what you consider ought to be represented in the Board of Trustees, with reference to the object of obtaining a fair representation of each of them in the general superintending Board?—That question is so nearly related to the last that I must give an answer very similar to the last, that I am not sufficiently acquainted with the subdivisions generally of the British Museum to say how many gentlemen should be appointed on the Board of Trustees to represent those departments.

1035. Supposing that there are three or four general departments, and each of those departments subdivided, would you think it necessary that there should be a representative of each of those departments, or that there should be a representative of each of those subdivisions; for example, in natural history, would you consider it sufficient that natural history should be represented generally by one Trustee, or that there should be a Trustee for botany, a Trustee for zoology, a Trustee for mineralogy, and for the various subdivisions into which each of those departments might be again separated?—I should certainly think that it would conduce very much to the objects of the British Museum in so far as related to natural history, to have upon the Board of Trustees, at least a member who was profoundly conversant with mineralogy and geology, another who was equally conversant with botany, and another who was as well acquainted with zoology.

1036. Consequently, you would wish that not only each of the sciences in their general divisions, but in their subdivisions also, should be represented in the Board of Trustees?—I am not aware that the British Museum has much to do with the sciences generally.

1037. Supposing, for example, there were a geological Trustee and a mineralogical Trustee, do you think that those two gentlemen, and the heads of the two departments under them, might not occasionally come into collision with regard to the arrangement of those parts of the different departments which might be classed by one gentleman under one head, and by another gentleman under another?—I believe that there is not a separate department for geology in the British Museum, and another for mineralogy; but understanding those as forming one department, I should think it very advisable, and greatly for

R. Edmond Grant, M.D.

10 March 1836.

the benefit of that department, to have a gentleman upon the Board of Trustees who was profoundly conversant with those two branches of knowledge.

1038. Supposing there were a gentleman in the Museum, not being a member of the council, who had the superintendence of the organic fossil remains, and that he was of opinion that it was advantageous to have them distributed in the zoological arrangement; and supposing the corresponding Trustee upon the Board were desirous of arranging them stratigraphically, might not that create considerable jealousy and confusion between the professor of the department, and the member of the council who represented it?—Certainly not.

1039. Whose opinion do you think ought to prevail?—I think the Council or Board of Trustees would, in so peculiar a dilemma, weigh in their own minds the advantages of the one arrangement and of the other; if they found themselves not competent to form a decided opinion, they might seek the most proper means to make themselves thoroughly acquainted with the subject of their doubts, seeing that there was a difference of opinion between two gentlemen interested in that department, and make up their minds as to which plan was most for the general good.

1040. You think that it would be desirable to have a superior officer of a department, and a member of the board representing the same department, and that the differences that might arise between them should be settled by the board?—I am not aware that any differences would likely arise between gentlemen so situated; I have not found it from experience in the least degree probable that such differences would occur; on the contrary, from the experience of years past in such a situation in the University as that described, I have found the greatest benefit to arise from it.

1041. Are you aware whether the peculiar administration of the branch superintended by Sir Humphrey Davy was such as to be most gratifying and satisfactory to the officers under him in the department?—I do not know anything of that matter.

1042. You cannot conceive that any difficulties would be felt by an officer superintending the department, from a possible collision of opinion with the Trustee representing the same branch of science?—I see no impossibility in it; but I have stated, that from the experience of years past in a similar situation to the officer alluded to, I have found the greatest benefit result from having one or more councillors in the condition of the Trustee alluded to.

1043. Will you have the goodness to mention the councillor who does hold that exact situation in the London University?—I alluded to those members of the council of the University of London who are conversant with the departments of Natural History under my charge.

1044. Then you refer generally to members of the council who happen to be conversant with that department; but you do not refer to the case of one particular trustee appointed for the purpose of superintending one particular department?—Undoubtedly not to one Trustee appointed for one department; and I certainly think that it would not be judicious in the management of the British Museum to have one Trustee for the management of any one department, but that all the departments should be, more or less, represented in the Board of Trustees, and that they might aid by their counsels the deliberations of the body of Trustees in questions which might come before them.

1045. Mr. *Elphinstone.*] When the London University was first established, did not the council take upon itself the sole management and direction of its affairs, in the same way that the Trustees of the British Museum direct its affairs?—When the University was first established, the council, as they do now, took upon them the management of all that related to the pecuniary matters, and the general affairs of the establishment.

1046. The professors had no sub-committee to manage the affairs connected with education?—They had formed themselves into a body, long before that body was recognised by the council, to deliberate on matters of education, and to give a general opinion respecting such matters, when they might wish to address the council.

1047. Was that the case in the first institution of the University?—It arose almost with the foundation of the University.

1048. Did not a change of system take place about two years after the University

University was established, in consequence of the old system not having been found to work well?—I do not know what change is alluded to, or what particular derangement of the working is now referred to.

1049. The question refers to the time when it was thought necessary to discontinue the services of the warden, and the professors were requested to form a sub-committee of management?—I believe that the council were most reluctantly compelled to cease enjoying the valuable services of the warden from pecuniary considerations, the state of the University funds; and that his place has never been given up, but has always been represented in the board of council by a gentleman denominated now the secretary of the council, who is the representative of the former warden.

1050. You have been asked some questions relating to the opinion of Sir Humphrey Davy; might not he have had some idea of this sort: that all the present Trustees should be removed, and that each scientific body in London should appoint a Trustee?—I am not aware, from anything that I have seen of Sir Humphrey Davy's sentiments, that such was his opinion.

1051. Do you conceive that that might be a good plan?—Anything would be better than the present system.

1052. Sir *R. Inglis.*] Upon the supposition that it would be possible to study a science, for instance, geology, either on the system of Werner or on the system of Hutton, do you conceive that there ought to be upon the Board of Trustees two gentlemen as representatives of the two systems; or that if there were not two geologists of this character upon the Board, but only one, and therefore, if Professor Jameson had been at the head of the department of Geology and Professor Playfair had been the Trustee of Geology, or *vice versâ*, that the professor at the head of the department in the Museum would have been better pleased to have been under his rival in the Board of Trustees than to have been under a Board constituted as it now is?—I think, that as the Board of Trustees could have nothing to do, and as Professor Playfair, in the capacity of a Trustee, could also have had nothing to do with the system which might be taught by Professor Jameson, or any of his particular views in the science, that he would have been greatly pleased by having so distinguished a philosopher as Professor Playfair to signify to his colleagues in the Board of Trustees the wants of the chair of mineralogy and geology.

1053. Does that apply to the arrangement of the collection as well as to the formation of the collection; how far would it influence Professor Jameson, for example, in arranging his collection, if it were made under the direction of a person holding opposite opinions to his own in geology, and not leaving him to the free exercise of his own discretion?—I conceive that whatever arrangement Professor Jameson would have made of the materials in his department, that that would not be changed by any one member of the council upon his own individual authority, but that if any member of the council could suggest some alteration in the arrangement still better than that adopted by the professor, that that would be readily adopted by him, or it would be examined by the Board of Trustees, and their judgment would be made up upon the respective merits of the arrangements, if such a subject of discussion could ever come before them.

1054. If a man of science at the Board were to govern the Trustees in opposition to the professor, what would be the advantage to the interests of the department in the Museum, so far as the chief of the department was concerned?—I do not conceive that any one member of the Board of Trustees would govern the professor or govern the Trustees, but that he would, like the others, express his own views and opinions, which would no doubt be considered of great value by that Board of Trustees, and in all probability they might sometimes have influence with the professor under him to induce him to modify his opinion, if it were not well-founded, by his superior knowledge or penetration in some department.

1055. Do you think that Professor Playfair would have influenced Professor Jameson?—I think that Professor Jameson is the highest ornament in the department which he professes that ever Great Britain could boast of; and that that distinguished naturalist would, upon a suggestion coming from so great a philosopher, eminent in a different department, altogether distinct from his own, as Professor Playfair, that he would weigh deliberately the opinion of so learned and valuable a man.

R. Edmond Grant, M.D.

10 March 1836.

1056. When you state that Professor Playfair was eminent in a different department, do you wish the Committee to consider that Professor Playfair, as the great promulgator of the Huttonian theory, might not be considered eminent in that very department of science to which Professor Jameson has devoted his attention?—Undoubtedly he was not.

1057. As the representatives of two rival systems, do not you consider that Professor Playfair might be considered as directly opposed to Professor Jameson?—Although they were opposed to each other in their views of geology, Professor Playfair's department was natural philosophy, embracing all the branches of that science. The department of Professor Jameson is especially mineralogy, the characters and classification of minerals, together with geology, and the general details of the other departments of natural history; and I conceive that a suggestion coming from so great a natural philosopher as Professor Playfair, who was also acquainted with geology generally, so much so as to write a very beautiful work, illustrating the Huttonian system, that his opinion would have its due weight with Professor Jameson upon all occasions.

1058. Mr. *Marshall.*] In some of the questions you have been asked, the scientific Trustee who has been spoken of has been described as a Trustee appointed to superintend one department. In another question it has been suggested that this scientific Trustee might govern the other Trustees. Now, in the suggestion that you have made, that it would be expedient to have a scientific Trustee on the Board of Trustees, is it with a view of the other Trustees being bound by his opinion, or only ascertaining his opinion, and then themselves deciding upon the subject?—I think most undoubtedly that the object of having a scientific Trustee would be for the general body to avail themselves occasionally of the superior knowledge which he possessed of that particular department, that they might make up their own individual opinions upon a more extensive examination, and a more thorough knowledge of the question before them, and that it never would be contemplated that such Trustee, from his superior knowledge, should govern or should regulate entirely of his own authority any particular department in the Museum.

1059. Supposing you were a professor of geology in the British Museum, would you like or dislike to have a professional Trustee, who was well acquainted with the science?—I should be charmed to have another gentleman connected with the institution who was thoroughly acquainted with the subject entrusted to me, because then I think he would be able to look better and more thoroughly into the interests of the department entrusted to me, than if there was no such representative in the Board of Trustees.

1060. Mr. *Compton.*] If you think a professional man would be a better Trustee than a gentleman of general taste and literature, and there were a sufficient number of professional Trustees to overlook all the different departments of the British Museum, why is it necessary to have other Trustees?—I think that in the management of so extensive an establishment as the British Museum, that mere men of science, who often are not so conversant with matters of business, and with the various kinds of practical knowledge required in conducting the financial affairs of a great national establishment, would find their judgments greatly aided by the assistance of men of high rank and station in society, and general acquaintance with business and extensive general knowledge; and they would by that means do better than if they were left to their own unaided judgment in matters where such details were to be brought forward as did not immediately relate to their own individual departments of science. I think also, with regard to the trust of immense national treasures, and of great sums of money voted by Government, and for the higher relations of an establishment like the British Museum, it would have more weight, both in the scientific world and with surrounding nations, if it had associated with its management gentlemen of the highest influence in the kingdom. I am far from wishing to see the character of the body of Trustees entirely altered in regard to that particular point; but I should much desire to see introduced into the body of Trustees a greater proportion of scientific gentlemen, profoundly conversant with the departments of science that belong to that establishment.

1061. Sir *R. Inglis.*] In your answer, No. 315, you state as follows: "I conceive that as compared with the corresponding institution of our continental brethren, the zoological collection of our National Museum, and the management of that collection, and the whole management of the British Museum,

Museum, are an opprobrium to the British Nation in these enlightened times." Assuming that the phrase of "continental brethren" is meant to apply to men of science in every kingdom of Europe, or at least in every kingdom to which your knowledge applies, will you state in detail the divisions of the zoological collection of the National Museum to which you consider the term of opprobrium to the British Nation is justly applicable; first, with respect to the shells, do you consider the collection of shells in the British Museum to be an approbrium to the British Nation in these enlightened times, as compared with similar collections in any and what other countries?—My expression, "continental brethren" referred more especially to our continental neighbours the French, who, I think, manage these things better than we do in this country.

1062. Limiting the answer, then, to the consideration of the collection in Paris, will you state whether you consider the collection of shells in the British Museum is an opprobrium to the British Nation in these enlightened times, as compared with the corresponding collection in Paris?—My answer referred not to the shells in particular, but generally to the zoological collections of the British Museum, which were then the subject of examination.

1063. Mr. *Hawes.*] Do you wish to alter that answer?—Not a syllable.

1064. Sir *R. Inglis.*] What did you wish the Committee to understand by the three words, "the zoological collection," in answer 315?—I mean there the condition of the zoological collections generally of the British Museum with relation to the objects of such collections.

1065. What is your opinion of the collection of shells in the British Museum as compared with the collection in Paris, and does your view justify the application of the term "opprobrium to the British Nation," as directed against it?—My expression in that answer referred to the zoological collections generally in the British Museum, and had the question related to the collection of shells alone, I might have been induced to qualify the expression.

1066. As the zoological collection generally is made up of parts, what are the parts to which you wish that the term, "opprobrium to the British Nation" should be applied?—In order to come more directly to the question, I shall specialize one of the departments alluded to out of those contained in the general zoological collection, and for this purpose, I would specialize the collection of mammalia.

1067. Lord *Stanley.*] Do you apply your observations to the collection of mammalia only, or to what other collection?—I might specialize most other departments, though in different degrees, such as the collection of fossil mollusca.

1068. Sir *R. Inglis.*] As compared with the corresponding collection in France?—At Paris.

1069. What else?—The collection of fishes.

1070. Mr. *Hawes.*] More particularly from tropical countries you allude to?—From all countries.

1071. Sir *R. Inglis.*] What else?—The collection of zoophytes. I would specialize also the osteological collection, in so far as there is an osteological collection, although it is not recognised as a separate department in the British Museum.

1072. Mr. *Hawes.*] The class of reptilia, for instance?—I would include also the reptilia, with relation to the objects of such a collection.

1073. Lord *Stanley.*] You have stated that, as compared with other similar departments abroad, the zoological collection of our National Museum is "an opprobrium to the British nation in these enlightened times." The Committee wish to have that explained in detail, and to know what departments of the zoological collection you include in that answer, and with respect to which you are prepared to substantiate that charge?—Nothing would give me greater pleasure than to enter into the details which that answer embraces, and to substantiate any remarks that I may have made during my former examination. Perhaps, in order to show you whether or not my censure was well founded, an examination would be desirable of the zoological collections generally of the British Museum, in all their separate divisions.

1074. What part of the zoological collection do you include in the charge?—The charge, as I have already mentioned, did not relate solely to any one particular department, nor do I conceive it proper to restrict the censure to

R. Edmond Grant, M.D.

10 March 1836.

any one individual department, but to show that the remarks were made with deliberation, as they related to the then subject of examination, the general zoological collection of the British Museum. I have, however, already specialized some of those departments more especially alluded to.

1075. Lord *Stanley*.] Do you apply that statement to the mammalia?—Yes.

1076. Do you apply it to the birds?—I include the birds, although I would not specialize the birds, as if standing alone they would have excited that expression which I used upon the former occasion.

1077. Do you include the fishes?—Yes.

1078. Do you include the shells?—Yes.

1079. Do you include the reptiles?—Yes.

1080. Do you include the radiata?—Yes.

1081. The insects and crustacea?—Partly from report and partly from observation, I would be inclined to include those also.

1082. Mr. *Elphinstone*.] In your answer as to shells, do you include both fossil and recent shells?—Yes.

1083. Sir *P. Egerton*.] And also in your answer with respect to the mammalia and the saurians, both fossil and recent?—No; I would exclude the fossil saurian reptiles, but I would include the recent sauria.

1084. Do you include the fossil radiata?—Undoubtedly.

1085. And the fossil crustacea?—No, I would not, from my personal knowledge of the collection in Paris, include the comparison of the fossil crustacea.

1086. Mr. *Elphinstone*.] With regard to the recent shells, do you mean to include those or not?—Yes, I should include the recent mollusca.

1087. Mr. *Marshall*.] Do you include these various collections in equal degrees, or in different degrees?—In very different degrees.

1088. Mr. *Elphinstone*.] You do not mean to state that there are fewer shells in the British Museum than there are in the collection of Paris?—I have made a previous remark, that I did not refer to the numerical amount alone of the collections, but to the use and comparative value of the collections for the objects for which the collections are made.

1089. Sir *R. Inglis*.] Are you able to state to the Committee the points in which you consider the mammalia in the Jardin des Plantes superior to the corresponding department in the British Museum, in number, or in condition, or in arrangement?—Yes. I consider those of France as superior to those of the British Museum in number, in arrangement, in condition, and in value.

1090. Mr. *Marshall*.] What do you mean by "value;" do you mean the money value?—With reference to the object for which specimens are preserved.

1091. Mr. *Hawes*.] You mean the scientific value with reference to the scientific utility of the objects?—Yes.

1092. Mr. *Elphinstone*.] Are you aware that there are four times as many fishes in Paris as there are in the British Museum?—I should think that there are more than that number. I was informed by Valencienne, some four years ago, that the collection which had then been estimated by him, and by Baron Cuvier, at 5,000 species, he had found reason to consider as amounting to 6,000 species.

1093. Sir *R. Inglis*.] With respect to the birds, can you state anything of the number, arrangement, condition and scientific value of the ornithological collection in Paris and in the Museum?—The scientific value of the collection of birds in the Paris Museum I regard as infinitely greater than that in the British Museum.

1094. Sir *P. Egerton*.] Do you consider the collection of British birds in the British Museum as good or better than the collection at Cambridge?—I have not yet seen the collection at Cambridge.

Martis, 15° *die Martii*, 1836.

MEMBERS PRESENT.

Mr. T. G. B. Estcourt.	Mr. Ridley Colborne.
Mr. Hawes.	Lord Stanley.
Sir Robert Inglis.	Mr. Marshall.
Mr. Compton.	Mr. Elphinstone.

MR. T. G. B. ESTCOURT, IN THE CHAIR.

John Flint South, Esq., called in; and further Examined.

1095. Mr. *Hawes.*] I THINK in your former examination you stated it would be desirable to divide the Natural History department into a greater number of divisions than it is now separated into?—Yes, I did.

1096. And in that case you would give each officer a greater share in the management of his department, if not make him altogether independent as regards the management of his own department?—I would make him altogether independent in his own department.

1097. Would you or not make him subject to the control of a principal Board of Trustees?—He should be under some control in common with the other officers of the department; and I am inclined to think that a Board of Trustees should be the authority to whom he should be responsible.

1098. Suppose some such constitution as this were proposed, that the family Trustees should remain permanent, the elected Trustees should remain for their lives, but that the other Trusteeships should be abolished, with a view to make way for individuals appointed by certain learned societies, do you think to such a principal Board of Trustees there would be any practical objection?—I should think it would be very advantageous, inasmuch as persons accustomed to scientific pursuits would be much better qualified for managing such an institution as the British Museum than gentlemen, however otherwise highly qualified, but not accustomed to those pursuits.

1098*. Would you vest in such a Board the absolute appointment of heads of departments, and give them a power of control generally, while you left, as far as practicable, the heads of the departments independent?—Yes; certainly.

1099. That to you would appear a good scheme for the government of the Museum?—I do not see how any institution similar to the Museum could go on without there were such governing power.

1100. Would there be any objection, in your mind, to making this principal Board responsible to the principal Secretary of State for the Home Department in its turn?—I can see no objection to that.

1101. Lord *Stanley.*] Supposing the Board to be responsible to the Secretary of State for the Home Department, do you think that that minister, with the duties he has to perform, would exercise a *bonâ fide* and effective control over such a Board of Trustees?—I should imagine he would exercise as much authority over it as over any other office he has under his control; for instance, as he does over the anatomy schools. For although there is an inspector, yet still the Secretary of State is the person to whom we should look if we had any cause of dissatisfaction with the conduct of the inspector; and he is also the party to whom the inspector reports if he have any cause of complaint against us.

1102. That is to say, the reports are sent in by the inspector of anatomy, and the Secretary of State is appealed to if there is any infraction of the law?—Yes.

1103. In what way do you conceive the responsibility of the inspectorships of anatomy to the Secretary of State, being such as you have described, is analogous to the responsibility you would impose upon the Trustees of the Museum to the same minister?—In case any of the parties acting under the Trustees consider themselves aggrieved, that the Secretary of State should be the person to whom they should have a final appeal. Precisely as in the case of a college, in which a member of

J. Flint South, Esq.

15 March 1836.

that body fancying himself aggrieved by the decision of the governing powers of that society has the privilege of referring to the visitor for a revision of the order complained of.

1104. Sir *Robert Inglis.*] You do not propose that the Secretary of State should have any other than a visitatorial power?—No, certainly.

1105. To whom you would appeal against anything decided unjustly in the way of an appellant?—Yes; but I hardly imagine any such case would arise.

1106. Lord *Stanley.*] You do not propose to give him a veto over the appointment of the officers, or the dismissal of the officers?—No, except under the circumstances I just now stated; that is, if the party dismissed thought himself aggrieved, that he should have the right to appeal to that minister.

1107. Then you do propose to give him a discretionary power?—No further than the visitor of a college has a control over the proceedings of such society.

1108. Mr. *Ridley Colborne.*] You mentioned just now, that certain Trustees should be appointed by the learned bodies; what learned bodies do you refer to for the moment?—I should think the Universities certainly ought to have the power.

1109. Lord *Stanley.*] How many of them?—When I am speaking of Universities, I am speaking of the English Universities, Oxford and Cambridge.

1110. Not the London University?—There is no such body at present in existence that I am aware of.

1111. Mr. *Ridley Colborne.*] Do you mean that they should nominate one alternately, or in what manner?—That they should nominate conjointly. The appointment might be vested in the chancellor of each University and the presidents of the principal learned societies in London. Such, I conceive, would be the most competent electors, as being men of high scientific acquirements, and not likely to appoint a Trustee who would not do credit to their choice, and whose appointment would therefore be satisfactory to men of science in general.

1112. In what way could you suggest that they should select that individual?—I have not turned my mind to that point; but I apprehend there would be no great difficulty in making satisfactory regulations for that purpose. I do not know how the Trustees are at present appointed, except that I believe they are appointed by the Secretary of State. If it is vested in him, he probably takes the advice of others more conversant than himself with the qualifications of the parties from whom he may choose to make his selection.

1113. Do you think if the heads of colleges or chancellors were to meet, and say, let us nominate a fit person for a Trustee of the British Museum, that it is likely they would make a very good selection?—I think if the electors were such as I have proposed, you have the fairest presumption that they would make a good selection.

1114. Lord *Stanley.*] Why do you think the heads of colleges at Cambridge and Oxford would concur to appoint better Trustees than other persons appointing trustees to an institution in which they have a deep interest?—I did not propose that the heads of colleges should appoint, but that the chancellors and the heads of the learned scientific societies in London should appoint.

1115. Would not that be transferring the nomination just from one set of individuals in the same situation to another, with no very great practical alteration or advantage?—It might seem so at first; but I think it would really have the effect of causing greater care to be taken in the future appointment of Trustees to the Museum than probably there has been hitherto.

1116. Mr. *Hawes.*] Do you know the constitution of the Astronomical Society?—I cannot say at this moment I recollect.

1117. Do you happen to know that the president is elected annually?—Either annually or every two years.

1118. Do you know that the same plan in the election of president exists in the Geological Society?—He is elected every two years.

1119. Would you to two such societies give the power of nominating an individual as a Trustee of the British Museum?—I would to the presidents of such societies, because their election as presidents is fair warrant that they are men of high talent, and, therefore, fully competent to the election of such important appointments as those of Trustees to the Museum.

1120. At present the Trustees of the Museum you are aware are elected among themselves?—I thought they were appointed by the Secretary of State.

1121. Sir *Robert Inglis.*] Do I understand you to mean that the presidents of scientific bodies, whom you desire to see added to the Board of Trustees, should be added

added in lieu of the official Trustees, and whose titles are enumerated as follows in answer 16 of the evidence of last year, beginning with the Archbishop of Canterbury?—I do not think I stated as my opinion that the presidents of the societies should be added, but that the election of new Trustees should exist in them and the chancellors of the two Universities.

1122. Lord *Stanley.*] When you speak of the election of new Trustees, do you speak of that part of the body at present elective, or as a substitute for the official Trustees; do you know how they are elected?—Part are family Trustees, and part Trustees from office.

1123. Is the body you propose to introduce to be in lieu of the elective Trustees or of the official Trustees?—In lieu of the official Trustees most certainly.

1124. Sir *Robert Inglis.*] In the answer with reference to the substitution for the official Trustees, probably you do not mean to exclude the president of the Royal Society, the president of the Royal College of Physicians, the president of the Society of Antiquaries, or the president of the Royal Academy, who at present are official trustees?—No, certainly not.

1125. Mr. *Hawes.*] The Committee have been informed by Mr. Children, one of the officers of the Museum, that the mammalia are at present in a good state with respect to arrangement; he says they are arranged according to Cuvier, and most of them are named: have you any opinion to offer upon that point?—I do not think most of them are named; and as to arrangement, it is hardly possible, in the present confined state of the Museum, to arrange them as they should be; but I think they might be arranged better than they are, even under the present confined circumstances.

1126. The same gentleman is asked, "Is Cuvier's system of nomenclature and classification adopted throughout?" To which his answer is, "Yes, with the intercalation of such new genera as more recent discoveries may have rendered necessary." Can you give the Committee any opinion upon that point?—It is pretty much so in the mammalia. The birds are partially arranged on Temminck's plan, but not completely.

1127. Then such a description of the nomenclature and classification is correct?—Generally, I should say it is.

1128. Lord *Stanley.*] Would you consider it desirable, new rooms being in progress for the Zoological department, that any alteration should take place in the arrangement in the present confined space previous to those new rooms being prepared to receive the collection?—I think it might be advantageous, as facilitating their arrangement in the new rooms, and it would also render them more useful to the public while they remain in the present cabinets.

1129. Mr. *Hawes.*] In answer to the question 3123, the same gentleman tells us that the specimens of the class mammalia are named according to the latest and most approved nomenclature; is that so, in your opinion?—The naming of the mammalia is not sufficiently extensive to warrant such an answer. The names are generally Linnæan and Cuvierian names, and there may be one or two interpolated, but not generally, in the mammalia. I did not, however, say that the specimens generally were named, or mostly named; but of those to which names are attached they are mostly Linnæan and Cuvierian. There may be a few more recent names, but they are very few, particularly in the mammalia.

1130. Lord *Stanley.*] Then we understand, as far as they are named, you agree in the answer which has been given as to the system; but you complain that there are a considerable number not named?—Yes.

1131. Mr. *Hawes.*] We are also told that the name of the naturalist whose system is adopted is attached generally to the specimens; is that so?—It is not so generally in the mammalia. It is in the birds, and it is so in the reptiles; but, to the best of my recollection, it is not in the fishes.

1132. Sir *Robert Inglis.*] Have you lately viewed the collections in the Museum with a specific reference to the subject of your examination?—About a fortnight or three weeks ago.

1133. Mr. *Hawes.*] We are also told there are various specimens of shells without any names, and the reason given for that is, there has not been time; are you or are you not aware that Dr. Leach had extensively in his time named the shells?—I have heard it as matter of common report, but personally I do not know such to have been the case.

1134. It is stated that the bird-stuffer at the Museum is paid by the job; do you think that a desirable plan?—I think it would be much better if there were

J. Flint South, Esq.

15 March 1836.

a stuffer specially employed by the Museum, and kept at work there; because, in a large collection of stuffed animals, there are a considerable number of jobs constantly requiring attention, and a number of these might be done in the course of a day at a trifling expense. But if the specimens to be adjusted or mended are to be sent from the house to the stuffer, it would give rise, as I hold, to much unnecessary expense.

1135. Lord *Stanley*.] You think it would be a more economical arrangement to have a salaried bird-stuffer for the work the Museum has to do than to send them to a bird-stuffer?—I do.

1136. Do you know what number of specimens have been sent in the last few years to the bird-stuffer?—No, I do not.

1137. Then upon what do you found your calculation?—From having a collection of my own, and knowing what is required to be done from time to time. Part I do myself at a trifling expense, and the part I am obliged to send out costs me a great deal.

1138. That is to say, you do yourself the easier and simpler parts, and you send out to a professional person those that are more difficult and more expensive?—No, just the reverse. The part I used to do was the skeleton making, the greater part of which I did myself; but the stuffing part I did not profess to know anything about, so far as setting up animals is concerned. I know when a trifle is requisite to be done to keep any specimens in proper order, and if it need any alteration I am obliged to send such things to the stuffers; but if I were able to do such trifling matters myself, I could do in the course of a couple of hours, and much cheaper than I could get them done, as much as would take a man a considerable time, considering he has to come to my house to fetch the specimens away and bring them again, which time must be paid for.

1139. Do you mean to say, supposing you prepare a part of your specimen yourself, it would answer to you, in a pecuniary point of view, to have a salaried person?—Yes, that I can speak to, as I have both stuffed and anatomical specimens.

1140. I am speaking of birds?—It is the same sort of work.

1141. Although the same sort of work, must not the comparative expense depend upon the amount of work to be done; and looking to the amount of work, do you think it a more economical plan to have a salaried person in the British Museum than to employ a person when wanted?—Yes, I do; because not only is a stuffer needed for setting up new specimens, but also his constant attendance is requisite to see that the specimens in the Museum are in a proper state, and not attacked by insects, the ravages of which can only be stopped in the first instance, and not always even then.

1142. Are you aware whether the Trustees of the British Museum ever tried that plan?—I am not.

1143. Sir *Robert Inglis*.] Do you know the bird-stuffer employed at the Museum?—Yes, very well.

1144. Is he qualified for his office?—Yes; he is a very clever man.

1145. Do you know any one superior to him?—I cannot speak positively on that point, but I consider him an extremely clever man.

1146. Do you consider that the art of stuffing birds has greatly advanced in the last half century?—Certainly; and in the last 10 years very materially.

1147. Mr. *Hawes*.] Another officer of the Museum, Mr. Gray, has informed the Committee that the whole collection is arranged in classes, orders, and genera, so that any specimen may be immediately found; should you be disposed, from your knowledge of the Museum, to confirm that opinion?—Certainly in classes, but not satisfactorily in orders or families.

1148. Mr. König, in his evidence, had his attention called to the description of the sturgeon, and he was asked whether the description of what is usually called the air bladder, as it stands in the Synopsis, is correct, where it is called the swimming bladder?—I do not recollect the description in the Synopsis; it certainly is not called generally the swimming bladder.

1149. Sir *Robert Inglis*.] Is it so described in any work of authority?—Certainly not of late.

1150. Mr. *Hawes*.] Mr. Children, in defence of that description, refers to Dr. Grew as an authority, who says, "The braces have the nature and use of tendons in contracting the swim, and thereby transferring the air out of one bladder into another, or transferring it from them both." Can this be the case, when there

are

are instances of swimming bladders without any apertures?—No. There are many instances in which fishes have no air bladders, and others in which the air bladder is not divided into parts, and others in which the air bladder has no aperture.

1151. In page 57 of the Synopsis is the following passage: "The common angler (*lophius piscatorius*) has a very large head and capacious mouth, surrounded by a species of long filamentous processes or tentacula." Do you think that a correct description?—No, certainly, that is not correct; at least as regards those filamentous processes, which are about an inch, or an inch and a half at the utmost, in length, surrounding the mouth. But the apparatus by which the animal is said to entice the smaller fishes within its reach is a portion of the first dorsal fin, situated far forwards, near to the head; this process is about three quarters of a yard in length, and is the part which, being moving about, is supposed to serve the purpose of a bait for other fish.

1152. Is there a specimen of this fish in the British Museum?—Yes, a very bad one.

1153. Perhaps as a defence of the description, if it was founded upon that, it would account for the error?—I do not think it shows the filaments at all.

1154. In the question and answer 3206, Mr. Children speaks of the bronchial sac of fishes; do you conceive that to be correct?—I do not know that fishes have any air apparatus at all, except the air bladder, which cannot be meant, and therefore I do not know what bronchial sac in fishes means.

1155. We are told in question 3213, that the reptiles and radiated animals are named throughout; is that so?—Yes, I think pretty much; as far as my recollection serves me, the radiated animals are generally named and arranged very nicely.

1156. In such a collection as the Museum, duplicates must necessarily be obtained at times; how would you recommend the disposal or appropriation of those duplicates?—I think there should be a distinct understanding, upon the reception of any specimens, that the Trustees have the power of disposing of any present whenever any better specimen of the same species is given or purchased. It is useless to load the Museum with four or five individuals of the same species.

1157. What do you think of the comparative expediency of selling the duplicates, or of using them in the formation of branch museums?—I have not at all thought upon that matter.

1158. Can you give the Committee any information upon the Zoological department of the library of the Museum?—I do not think it is so extensive as it should be in so large a library; and in this respect I think it far inferior to the library at the College of Surgeons, having had frequent opportunity of referring to both libraries.

1159. Is there any catalogue at present of the Zoological collection in the Museum?—None distinct.

1160. Is there any accurate catalogue of the library that you are aware of?—The catalogues of the library are more than one; there are two or three catalogues of the printed books.

1161. There is no consolidated catalogue?—No.

1162. What is your opinion of the comparative merits of a classed or an alphabetical catalogue?—I think a classed catalogue would be of great value, as it would at once show all the books contained in the library upon any one particular subject.

1163. Do you think that essential to so extensive a collection of books as there is in the Museum?—If the library of the Museum is to be put to its greatest use, certainly.

1164. You yourself individually, as a scientific man, would recommend, whether for your own use or the use of students generally, the formation of a classed catalogue?—Certainly. There is such a catalogue to a certain extent; viz. that by Mr. Dryander, of Sir Joseph Banks's library, now forming part of the Museum collection.

1165. Have you had any occasion to use Watts's Bibliothea?—Yes, frequently; but it is useful only for English works.

1166. If there were a classed catalogue, that would not be necessary?—Certainly not.

1167. Do you happen to know, from the appearance of the book, whether it is extensively used in the Museum?—It is very dirty.

1168. Does it bear the mark of great use?—It does.

1169. Are there facilities given to persons frequenting the library at the Museum?—Yes, certainly; and I believe every one frequenting the reading-room will

J. Flint South, Esq.

15 March 1836.

will agree with me that every facility is afforded to them. Mr. Cates particularly I speak of as being peculiarly kind and obliging. Whenever any difficulty arises in finding a work in the catalogue, he never hesitates in taking the greatest pains to endeavour to furnish what is required; and if it do not appear in the catalogue, as must be the case with new books occasionally, he takes immediate steps to ascertain whether it be in the house or not.

1170. Would you recommend any extension of the hours for the use of the library?—It has not occurred to me that that would be particularly advantageous.

1171. Are you aware that some years ago the Museum was open, during certain parts of the year, from four to eight?—No, I am not.

1172. Do you think it desirable that that regulation should be restored?—Personally to myself, it would be a matter of no consequence. The reading-room is open at present at the time most convenient to me, and I apprehend to most literary men, because they want their evenings to digest what they have been collecting at the Museum in the course of the day.

1173. But to professional men, whose business occupies them the whole day, it would be, for the same reason, convenient if they had access in the evening?—Yes. But I have great doubt whether it would be used in the evening for little more than novel reading.

1174. You would not recommend an extension of the hours?—No.

1175. Sir *Robert Inglis.*] In reference to your answer with regard to the inconvenience of loading the Museum with four or five specimens of the same subjects, do you think it important to preserve the identical specimen first discovered as historical evidence?—Yes, most certainly; and in support of that practice, I would mention that there is at this time a Danish physician, Dr. Beck, who was in England a short time ago, travelling over Germany to verify the descriptions of new genera given by different writers with the identical specimen from which such description has been made.

1176. However inferior might be the specimen of the ornithorhynchus paradoxus, or, for instance, however inferior the original specimen of the giraffe, you would still preserve them as specimens illustrative of the history of science?—Certainly; and in such case I consider it right that it should be marked as the first specimen discovered, and by whom, and at what date; circumstances which would render it an object of great interest, even to the casual visitor.

1177. Then your answer, to which your attention was first called, does not apply to the not having any duplicates, but you admit a reason for the detention of all the original specimens of subjects?—Yes. I believe Sir Joseph Banks was the first that brought the kangaroo to England. I am not aware whether that specimen is in the Museum or not; if it be, it is extremely valuable as having been the first of the kind brought to Europe; and such ought to form an exception.

1178. Mr. *Marshall.*] In the answer you gave to the question respecting keeping the Museum open in the evening, did you allude to the library, or the other part?—Only to the library; the other part, I apprehend, could not be thought of.

Richard Owen, Esq., called in; and further Examined.

Richard Owen, Esq.

1179. Sir *Robert Inglis.*] IN your answer to question 499, it appears that you have stated you have suffered most loss of time, and paid the greatest number of fruitless visits, in the expectation of finding the Banksian Library of Natural History maintained in the spirit of its formation, and that you have inquired in vain for nine out of ten of the recent works upon zoology; will you state to the Committee the works you have desired to find there, and the circumstances under which the desire was expressed?—I have a long list of such works at home, which I will forward to the Committee; they are works which are zoological in the extended sense of the word, but they relate to the comparative anatomy and comparative physiology of different classes of animals, and, in some instances, are monographs, treating of a single species.

1180. Were those works printed in England or on the Continent, and if on the Continent, in what part?—They were printed almost exclusively upon the Continent: some are Italian works; the greater part are German, of which some were published in Prussia, and others in other German states.

1181. What was the date of the most recent work which you desired to find and did not find?—I should quote Delle Chiaje, Istituzioni di Anatomia e Fisiologia Comparata: the first volume bears date 1832; also Pander & Dalton's Skelette

der

109

der Saugthiere.' The date of that work runs to 1828; it is in different volumes, and has appeared at different times. *Richard Owen*, Esq. 15 March 1836.

1182. What was the earliest date?—1821. It commenced with the Riesenfaulthier, or Osteology of the Sloths.

1183. Are you acquainted with any other collections in this country in which this work could be found?—I believe it does not exist in any other public library in this metropolis except that of the College of Surgeons.

1184. In your own library you find the work?—It does exist there; but it was in consequence of the books being inaccessible during the alterations of the building that I have been necessitated to inquire at the British Museum for many works which we have at the college, and which I have not found in the Zoological department of the National Library.

1185. But the complaint arose principally from your not finding a recondite work on a particular branch of natural history, published in a foreign state?—Exactly so; from the absence of works of that description.

1186. And published within the last 12 years?—Yes, certainly.

1187. Would you describe those works generally coming within the description of the literature of comparative anatomy?—Generally so; they are precisely such works as we find in Mr. Dryander's catalogue of the Banksian Library; they are continuations of the same subjects which are treated of in the works contained in that classed catalogue.

1188. From a re-consideration of your answer 513 [*handing the same to the Witness*], are you disposed to retain the opinion you have expressed?—Yes; that a catalogue of any one class of animals might be comprised in one quarto volume, conducted upon the plan I alluded to before in my first examination.

1189. Mr. *Hawes.*] Your complaint is, generally, that the Zoological department of the library is deficient?—Yes, that it does not afford that assistance to persons engaged in searches on comparative anatomy which the Banksian Library did in the time of Sir Joseph Banks. I know, from information from Mr. Clift, that in the early days of Sir Everard Home, in his researches in comparative anatomy, the greatest assistance was rendered to him, and a great deal of time saved to him, by finding in the Banksian Library the greater part of the works on comparative anatomy which had been published up to that time in the different European states.

1190. Is there such a work at the British Museum as Blainville's Principes de l'Anatomie Comparée?—I know it was not there some years ago; but that being an elementary work, its absence is of far less consequence than the monographs, and the more expensive publications.

1191. Take also Scarpa de Auditu, for instance?—That ought to form part of the National Library of Zoology.

1192. Can you state whether the council of the College of Surgeons have been obliged to go to very considerable expense in consequence of the deficiencies in the Zoological department in the library of the Museum?—Yes, and I will explain the circumstances under which this took place. At the commencement of the formation of the catalogues, in consequence of the loss of time which I incurred in visits to the Museum, which were fruitless, and not finding there so complete a library as would have been sufficient for the references necessary in the work I was engaged in, I was compelled to ask for the purchase of such books: a carte blanche was granted for zoological works, and the first purchase exceeded 1,000 *l.*

1193. Will you furnish the Committee with a list of such leading authors who have written works, more especially on zoology, which are not to be found in the library of the Museum?—I will.

1194. That list will comprise the principal writers which would be essential to the use both of the student and the man of research?—It will comprise many such works.

George Rennie, Esq., called in; and Examined.

1195. YOU are a Sculptor?—I am. *George Rennie*, Esq.

1196. You resided for some time at Rome?—I was eight years in Italy, Greece and different parts of the Continent.

1197. Did you mould any of the principal statues at Rome?—The Apollo Belvidere was moulded at my request.

1198. Do you apprehend that any injury is likely to accrue from moulding

statues of the highest class, if done under competent superintendence?—Not generally; I should say that nine statues out of ten may be safely moulded; but there are examples where, from undercutting and very tender relief, there may be danger; but I think that it may be very much obviated by moulding once, with great care, those parts which are delicate, and keeping one or two of the proof casts of such parts to be remoulded; but generally the whole of the statue should be fresh moulded whenever the old mould is worn out.

1199. Do you think any advantage would arise from facilitating the taking of moulds, and furnishing casts to the public from the principal statues in the Museum?—I conceive there is no way in which a knowledge and taste for the arts can be diffused better than by exhibiting the casts from the finest statues of antiquity throughout the country.

1200. Do you think it advisable, therefore, that a formatore should be attached to the Museum?—I think it very desirable that a formatore and a depôt of casts should be attached to the Museum.

1201. Both with reference to the improvement of the artist, and the improvement of the public taste?—I do.

1202. Do you think it expedient that any artist should have any exclusive privilege in that respect?—Certainly not.

1203. Can you give the Committee any information as to the price at which casts could be taken?—I can state what I paid for a cast of the Apollo Belvidere, which I took as an inducement to the formatore at Rome to mould the statue; I paid 45 Roman or Spanish dollars for a proof cast, which was under 10 *l.*

1204. Do you think it at all likely that an extensive sale would take place if a supply of such casts were furnished to the public?—I think there can be no doubt of it.

1205. What establishment would you recommend for that purpose, both with reference to supplying the public and insuring an absence of all injury to the statues?—I think a careful and competent moulder should be appointed by the Museum, with sufficient premises to carry on the business, and that the casts should be furnished to the public at prime cost; of course the formatore would be under the direction of the head of the department in which his labours were carried on, and every care ought to be taken that no injury should be occasioned to the statues.

1206. Have you had occasion to visit the department of Antiquities in the Museum?—Frequently.

1207. Are there any great facilities afforded to artists by the Trustees?—I have never copied there; I have gone to study by observation rather than by copying or drawing.

1208. With regard to the room in which the Elgin Marbles are placed, do you think they are judiciously placed for the students and artists?—I consider it impossible to light three rows of sculpture in one room; the sculpture on the sides of the Elgin collection are well lighted, but the centre row, from the perpendicular light falling on the statues, and the reflection from the light-coloured floor, entirely destroys the effect of light and shade, so as to make it impossible to appreciate their merits.

1209. And thereby their utility to the artist is most materially diminished?—Yes. I conceive I may give an example by citing the Ilissus, which is the finest fragment of antiquity of that class in the collection; as it is now seen in the Elgin room, it is impossible fully to appreciate its merits; in fact, if I had never seen it in plaster in a proper light, I could have no conception of its beauty from the position in which it is now placed in the Museum.

1210. Sir *Robert Inglis.*] Do you know who placed it?—I am not positive; I think it was arranged by Mr. Westmacott.

1211. Do you conceive that there is a higher authority in England than Mr. Westmacott in respect to ancient statues?—No, I do not. But, as I said before, it is impossible to light advantageously three rows of sculpture in one room, (viz. in the centre and sides) and without knowing the instructions under which Mr. Westmacott acted, I cannot say whether he had it in his power materially to arrange it differently.

1212. If you considered that the Ilissus was the finest specimen in the Elgin collection, could you conceive there was any better position in that room in which it might be placed?—I conceive if it was put on the side it would be seen to much more advantage.

1213. You think it a defect in judgment on the part of the artist who directed the arrangement that he did not place it there?—I would not make such a charge; but I have the opinion of Mr. Hawkins, the head of the department, who coincides with me, and I have also the opinion of Mr. Cockerell, than whom no person is better acquainted with all the details of the Parthenon; at the same time, I throw no imputation upon Mr. Westmacott, because I am not aware of the circumstances under which his arrangement was made.

1214. Mr. *Elphinstone.*] You are aware that students are only admitted some two days in a week at present, and that the public are excluded on those days; do you consider that as necessary for the advantage of studying sculpture?—I do not; I conceive that the public may be admitted during the study of the artists; I may say it is the practice at Berlin, at Dresden, and at Florence; and I would refer to the evidence of Dr. Waagen, who was examined before the Committee of Arts and Manufactures last session, who confirms my opinion.

1215. Do you think the same arrangement might be made in the British Museum as appears to be made in the museum at Berlin without inconvenience to the artists?—I conceive that the Museum might be open, as far as the convenience of the artists is concerned, every day; certainly five or six days out of the seven.

1216. What is the object for closing that one day?—There might be some arrangements to make that would render it desirable to close it one day.

1217. Mr. *Marshall.*] When does the Berlin Gallery close?—It is open from ten to four in the summer, and ten to three in the winter.

1218. Lord *Stanley.*] Do you know the comparative number of visitants to the Berlin Gallery and the British Museum?—I think it is 50,000 a year at Berlin.

1219. Do you know the number of visitors at the British Museum?—Last year 230,000 or 240,000.

1220. Then the number of visitors to the British Museum is from five to eight times as many as the Berlin Gallery?—Yes; but the British Museum being only opened three days a week, if it was opened every day it would be less crowded.

1221. Supposing the same number of visitors to come to the British Museum if it were opened every day, there would still be at the same time from five to eight times as many persons as are in the Berlin Gallery: according to the present system there are from 10 to 16 times the number?—Yes; but without knowing the number of rooms and the area, I could not tell the effect it would have in crowding the rooms.

1222. Mr. *Elphinstone.*] If the public are now admitted only three days in a week, and it appears 250,000 persons come in those three days, would there not be only half the crowd if they were admitted during six days?—That is my opinion.

1223. Do you think it necessary, for the improvement of the general knowledge of sculpture, that the students should be mere copyists and learners of the art of drawing, or do you think that they ought to stand in such a position as to examine different statues with reference to light and shade?—I conceive that much copying is injurious rather than otherwise to students, and it is the opinion of most artists that it is so; I might refer also to Dr. Waagen upon that subject. I conceive, after a student has learnt the rudiments of his art, he benefits much more by observing carefully and attentively the high classed works of art, than by devoting himself to mechanically copying them.

1224. And so attentively observing them, he would not be interrupted by the passing of the public?—I have never been so.

1225. Have you been there on public days?—Yes.

1226. Have you studied on those days?—I have always gone with such intention.

1227. Have you found any inconvenience?—No, I have not.

1228. With regard to the room in which the Elgin Marbles are placed, what do you think of the colour?—It appears to me that the colour resembles too much the tone of the marbles themselves; there is not sufficient relief; the floor, from its light colour, reflects very much to the disadvantage of light and shade.

1229. Are the galleries in Florence and Rome, and other places upon the Continent, open on holidays and fête days?—Yes, generally.

1230. Should you see any objection to that in this country?—I do not see any objection to it whatever.

1231. Sir *Robert Inglis.*] When you state that in answer to the question about

George Rennie, Esq.

15 March 1836.

the galleries of Rome, Florence and other places, do you wish the Committee to understand that the Vatican is open on fête days?—The practice at Rome varies under different Popes. Under Pope Pius VII. the Vatican was opened always on Sundays and fête days. At the accession of the next Pope this was altered, which occasioned much dissatisfaction among the people.

1232. In 1823?—Yes. The practice varies according to the inclinations of the then ruling Pope.

1233. In reference to the different galleries open on the fête days, with respect to the Louvre, can you state to the Committee whether the gallery of the Louvre be open on fête days to students in art?—I am not intimately acquainted with the practice at the Louvre; I have only visited Paris for a few weeks at different times, but never studied there.

1234. Mr. *Elphinstone.*] Are you aware it is open on Sundays?—Yes, I believe it is.

1235. Sir *Robert Inglis.*] To students?—To the public.

1236. How many other days is it open in a week?—I am not intimately acquainted with the regulations of the Louvre.

1237. Mr. *Elphinstone.*] Should you see any objection here to the Museum being opened on Sunday afternoon, after divine service?—No; I consider it would be a very rational and instructive amusement to the people, and I see no objection to it.

1238. Mr. *Hawes.*] You are aware that a formatore is attached to the Louvre at Paris?—Yes.

1239. Can you state to the Committee on what terms admission is obtained to take casts, and on what terms they are sold?—No.

1240. Do you know whether the provincial institutions in France furnish themselves with casts from the Louvre?—I cannot give a positive answer; I have always understood they are supplied from the Louvre.

1241. Is it your opinion that the artists, and even journeymen in France, are remarkable for their knowledge of drawing and design?—No doubt of it; art forms a part of the national education in France.

1242. Would the circulation of casts at a low rate tend to place our artists and journeymen on a level with the people of France?—I have no doubt it would improve them much.

1243. I need not ask whether it would not only be beneficial to art, but to trade?—I have devoted a great deal of time to make myself acquainted with the application of arts to manufactures, and I know of no way in which the application of art to manufactures could be more easily obtained than by circulating casts and ornaments of the best antique remains throughout the country.

1244. Mr. *Elphinstone.*] Should you think it advantageous to have a good collection of casts of the most celebrated statues in the Museum?—I think there is the greatest want at this moment of such an establishment in London of any capital I am acquainted with; I have felt frequently, and do daily feel, the want of a comprehensive museum of casts, including those from the Vatican, the Louvre, Florence and other galleries.

1245. Mr. *Compton.*] You have found fault with the perpendicular light in the marble room; is the room sufficiently large to place those that are now in the centre in a better situation?—I think it might be done.

1246. Mr. *Elphinstone.*] Had you been consulted in building the room or placing those statues, should you have built it in the same shape, and with the same arrangement as to light as the present?—I should say that no arrangement of the Elgin Marbles should be entered into without the advice of Mr. Cockerell, who has already been consulted by the Trustees in their publication of those marbles, and who is certainly better acquainted with the Parthenon than any artist in this country.

1247. Mr. *Compton.*] Do you think the room sufficiently large for a better arrangement?—Yes.

1248. If you were to place those statues now in the centre of the room nearer the wall, would not it intercept the view of those arranged against the wall?—I do not conceive it would, because the metopes and the frieze might be sufficiently high to admit of most of the works that now occupy the centre row being placed near the wall, without intercepting the view of them.

1249. Lord *Stanley.*] You recommend the establishment of a formatore attached to the Museum, and a comprehensive collection of casts; have you at all examined into

into the space and establishment required for such a purpose?—When I said I felt the want of such an establishment for a comprehensive collection of casts, I did not mean to say that such an establishment could be formed at the Museum.

1250. Confining your answer to the establishment of a formatore, you say you are well acquainted with the rooms in which the statues are now; will you state what means there are now for the establishment of a formatore's department?—It could not be in the rooms occupied by the sculpture.

1251. Are you aware of any other space that could be so occupied?—There appear to be very extensive buildings going on; but I am not aware of the plan of the buildings, or whether there is sufficient room to be devoted to such a purpose. As an artist, I think it very desirable.

1252. What space do you consider would be requisite for it?—A very considerable space; because the moulds occupy a good deal of room, and the casts in the process of casting also require considerable space.

1253. Can you give any idea as to about the space that would be required?—I should think considerably less than half the space now occupied in the Elgin collection.

1254. For the formatore establishment and the preservation of the moulds?—Yes.

1255. Mr. *Marshall.*] One story or two stories?—It might be advantageous to have a loft to put away the moulds.

1256. Lord *Stanley.*] You cannot point out any place in or about the Museum that could be converted to such a purpose?—I am not sufficiently acquainted with the locale to give an opinion upon that.

1257. Mr. *Hawes.*] Have you heard that the French government have applied for casts of the statues in the Museum?—I have not; but I conceive that casts from the Elgin Marbles are unattainable at present.

1258. Will you state the ground for that opinion?—I will quote Mr. Westmacott's own opinion, who states that his moulds are worn out, and that there are none others in existence. I feel, however, bound to state, that I saw Mr. Hawkins a few days ago, who told me that the Trustees had it in contemplation to have a new set of moulds made.

1259. Are the facilities on the part of the public great in obtaining casts, supposing moulds to exist?—I have once or twice applied for casts of sculpture existing in the British Museum to Mr. Sarti, and he has generally been able to procure me casts of those that have been already moulded.

1260. Have you had occasion to apply for copies of statues not moulded?—No, I have not.

1261. Suppose the French government were to make an application to the Government of this country for copies of the principal statues in the Museum, do you not think that would be a good opportunity to request casts of the principal statues in the Louvre?—Yes.

1262. And that it would be highly desirable to possess such a set of casts?—Highly so.

1263. Lord *Stanley.*] Where would you put them when you got them?—I conceive that it would not be difficult to find temporary accommodation for such a number as it would be desirable to have from the Louvre collection.

1264. Mr. *Hawes.*] Are you aware of the provision first made for the reception of the Elgin Marbles by the Trustees?—I am.

1265. It was not very costly?—Certainly not.

1266. It was better than not having such sculpture at all?—Undoubtedly.

1267. And, therefore, though the accommodation should be but slight and inexpensive, still it would not be an objection to the application for the finer casts in Paris?—I have no hesitation in saying, that such a selection as would be made from the collection in the Louvre could be accommodated without any very great inconvenience in the British Museum at the present moment.

1268. Lord *Stanley.*] How do you reconcile that answer with the one you gave just now, that you were not sufficiently acquainted with the locale of the Museum to say whether there was room for a formatore establishment?—I conceive that

George Rennie, Esq.

15 March 1836.

such a locale as would be necessary for a formatore establishment, from the processes carried on, would require a very different space from the accommodation to be given to casts already made; I conceive, without being seriously inconvenient to the present collection at the British Museum, if it was desirable to possess casts of statues from the Louvre, that those casts might be placed there temporarily; I might cite one room, where the Phigalian frieze is now placed.

1269. Supposing it was desirable to obtain casts from the Louvre, you would not limit yourself to that, but you would think it desirable to have casts from the most celebrated collections in Europe?—Most highly desirable.

1270. Sir *Robert Inglis*.] Do you know the lineal measurement of the gallery of the Vatican?—I have paced it with a view of making such a calculation, and I should conceive that I am not very far from the mark when I say that the part open to the public is in length, including the different galleries and rooms, nearly one mile and a half in length.

1271. Can you state to the Committee the extent of the gallery of the Louvre, including in the term all the galleries in which the sculptures are at present placed?—I believe the gallery of pictures is 1,500 feet long.

1272. I did not refer to the pictures, but to the sculpture?—I cannot state that.

1273. You cannot state anything respecting the collections at Munich?—No, I have never been there.

1274. But with respect to the two collections in Rome and Paris, not including in the collection at Rome the collection in the Capitol, but limiting the answer to the Vatican and the Louvre in Paris, you have a lineal extent of a mile and a half in the one, and in the other obviously a very considerable extent; are you still of opinion that a selection of such casts as you would desire to possess in the National Gallery of England, assuming such gallery to be in the Museum, could be compressed into the actual space of the British Museum, even if it were completed according to the plan now in progress?—I limited my former answer to a selection of the best statues in the Louvre; but when I stated the length of the Vatican to be one mile and a half, not one half of that is occupied by sculpture.

1275. Taking the lineal extent at merely 1,500 feet in the one, and taking 1,000 feet at Paris, do you conceive still that a selection even from the best works in those two collections, without reference to the best works at Munich, could still be compressed in the existing area of the British Museum?—I do; I conceive that the number of statues that it would be desirable to have from the Vatican would probably not exceed 20 or 30 whole length statues.

1276. And from Florence?—Not half that number.

1277. And from Paris?—Probably under 20. I allude to the groups and figures. There are a great many busts and fragments in all those galleries, that it would be equally desirable to have.

1278. In your statement with respect to the Elgin room at the British Museum, do you express your own single opinion, or the opinion of other artists, so far as you have collected it?—My own, with the corroboration of both artists and men, upon whose judgment I have great reliance, who concur with me.

1279. Mr. *Hawes*.] What is your opinion as to moulding the small bronzes; do you think any injury would accrue to them?—I think many of the small bronzes would suffer much from moulding.

1280. You would not recommend moulding them?—I should wish to see them before I gave an opinion. There is one instance, the Bronzes of Siris, now in the British Museum, and there are other bronzes, which could not be moulded without destroying them. I may explain that, by saying that the surfaces of many of the celebrated bronzes are considerably oxydised, and in moulding that oxydation would be removed, and the bronzes suffer materially; many, however, would not suffer at all.

Jovis, 17° die Martii, 1836.

MEMBERS PRESENT.

Mr. T. G. B. Estcourt.
Mr. Hawes.
Sir Philip Egerton.
Mr. Compton.
Mr. Ridley Colborne.
Mr. Bingham Baring.
Sir Robert Inglis.
Mr. Marshall.
Lord Stanley.

MR. T. G. B. ESTCOURT, IN THE CHAIR.

Nicholas Aylward Vigors, Esq., called in; and Examined.

N. A. Vigors, Esq.

17 March 1836.

1281. Mr. *Hawes.*]—I BELIEVE you are a member of the Royal, Linnæan, and other chartered societies?—Yes.

1282. And have both studied zoology and written various papers on the subject?—Yes; I have devoted a considerable portion of time to zoology; I should say from about the year 1819 to the end of the year 1832, when I came into Parliament.

1283. Have you had occasion recently to visit the British Museum?—I was there the latter end of last year, or rather the end of last Session of Parliament. I went there at the time this Committee was sitting, for the purpose of looking to the actual state of the institution, understanding that I should be called on to give some testimony respecting it.

1284. Confining the questions to the Zoological department of the British Museum at present, are you satisfied with the state of it, as a scientific man?—I am by no means satisfied with the state of it, speaking as a scientific man; but I am perfectly convinced that everything that could be done for the advantage of that department, has been effected by the curators and persons placed in authority over it; everything has been done with the materials on which they had to work.

1285. To what in your judgment is attributable the unsatisfactory state of that department of the Museum?—I should say that it may be attributed to the department of Zoology being mixed up with so many other departments, and the subject being one that does not attract the attention of the Trustees so much as those other objects of the institution, namely, Literature, Antiquities, and the Fine Arts, which possess more general interest, and to which they consequently have devoted greater attention.

1286. Would, in your opinion, the addition to the Board of Trustees of men versed in the department of Natural History be one means, or any means, of remedying the defect of which you complain?—I certainly think it would considerably improve the condition of that branch of the establishment, but I should not say it would remedy the defect entirely. If I were to pass a judgment on the subject I should say, that the department of Natural History ought to be removed entirely from the British Museum.

1287. Can you inform the Committee more precisely in what respect the Zoological collection is deficient and unsatisfactory?—It is generally deficient in all the departments; in some of the higher departments it is particularly deficient; it is deficient, for instance, in the mammalia; it is also very deficient in the birds. There is a good collection of insects, but not such as ought to belong to a National Museum. The shells appear to be the most valuable, and most extensive part of the whole collection, but even the shells are, comparatively speaking, deficient. I would add, that at the present moment there is, in this country, a private collection of shells, formed by an individual within a very few years, that contains nearly double the number of species that are found in the British Museum, and which, in a scientific point of view, is of ten times the value. It exhibits a series of specimens in most of the species, showing the gradations in age and differences by accidental causes, an object of great importance to science.

N. A. Vigors, Esq.

17 March 1836.

1288. Sir *R. H. Inglis.*]—Have you any objection to state to the Committee the collection to which you refer?—The collection was formed by Mr. Cumings, who has lately left the country with the wish of adding to it. He has left the collection in the hands of trustees, and has offered it to the Zoological Society on certain terms, I cannot now exactly state what they are; but his grand object was that they should be exhibited and arranged. At the same time, I must add, that that collection would have gone to the British Museum, if there had been the same prospect of justice being done to it in that institution.

1289. Are the Committee to understand by that answer, that it was the intention of Mr. Cumings to have presented this collection to the Museum, and that in point of fact he has presented it to the Zoological Society?—I cannot say it was his intention to do so, but I know that he speculated about doing so, and that in looking out for an institution where his collection would be deposited with most advantage to the public, he thought of the British Museum. He has not absolutely left the collection to the Zoological Society. There are certain conditions with which that society must comply before it is transferred to them. I believe they will comply with those terms, but if they do not, the collection will then be offered to the British Museum.

1290. It was a transfer without money?—There were certain money conditions annexed to it: namely, that he himself should, on his return to England, become the curator of the conchological department of the society's museum, at a certain moderate salary, equivalent to his services. That was one of the chief conditions.

1291. Mr. *Hawes.*] That condition, if the collection was an important one, might have been resolved into a sum of money?—The salary might be converted into a sum of money by being sold as an annuity; it was for his life he was to hold the office.

1292. What would be your opinion as to the value of completing, as far as possible, the Zoological collection in the Museum, on the supposition that your suggestion could not be acted on, namely, that of the removal of that property?—The suggestion that I should make would be what you have already observed, that a certain number of scientific men should be added to the list of Trustees.

1293. You think it desirable, supposing no removal to take place, that the collection should be put into much more perfect and useful condition than it now is?—Certainly; it ought to be put in a much more perfect condition; its condition at this present moment is extremely imperfect.

1294. What arrangements are adopted in the Museum, with reference, for instance, to the class mammalia?—The same system that has been adopted in the French Museum, chiefly that of Cuvier; but modified with certain modern discoveries and improvements.

1295. Are those modifications pointed out, so that the student may be aware of the alteration in the system professedly adopted?—They are pointed out generally, but not so much as if more assistance were afforded the officers for that purpose. At present, as much has been done, in my mind, for that purpose as could be done, with the very inferior assistance given to that department in the establishment; in fact, the Zoology of the Museum has not, I should almost say, a tenth part of the hands it ought to have in such a national institution.

1296. I will just ask your opinion generally, both with respect to science and popular instruction, on the importance you attach to rendering a national collection as perfect as possible?—In looking to the perfection of a zoological collection, I would consider that the grand object was to fill up every department, as far as it could be filled up, in order to show the great harmony in the system of nature. I speak with reference to the present improved state of science. The object in former days was chiefly to investigate the properties of, and to assign names to, individual species. The present improved state of science leads us to consider these species as united by their affinities and analogies into one grand system; to view them not merely as a collection of detached individuals, but as a series of individuals forming one grand and harmonious plan. Of course I should say, that the more complete the exhibition as to numbers, the more it was filled up in all its departments, the greater would be its perfection in furthering the object to which I allude, that of representing the grand system of nature. I think we have materials in this country, when we consider the exhaustless resources of England, her connexions abroad, and the opulence and enterprise of its inhabitants, to form such a collection as, in a very short time, would conduce to that grand design. But with the present limited resources of the British Museum, the officers of the Zoological

N. A. Vigors, Esq.

17 March 1836.

gical department literally can do nothing; they not only have no funds of their own, but from their present position, and the character which the Museum bears among men of science, they are debarred from having additions from other quarters. I know many valuable collections which would be sent to the British Museum, if zoology were cultivated there on a more liberal and comprehensive plan. They are now sent to other societies; and thus the separate collections, that would conduce to the great design of showing the grand harmonies of nature, are scattered in separate establishments, to which the student cannot have recourse, or recourse without much inconvenience. It would be a great object with the student to see all his subjects together, so as to be able to compare them in all their variations and affinities; and that object can only be gained by having all before him in one comprehensive establishment. He cannot go from one establishment to another, carrying in his recollection the immediate connexion between one animal or set of animals and another; he ought to have them at once before his eyes. The Zoological Society, for instance, has a very large collection, which if added to the British Museum would considerably improve it. There is a very noble collection also belonging to the Naval and Military Museum, with the means of being added to very extensively. There are various other public collections besides. Now consider, that if all these were placed together, or rather the *élite* of each, sufficient being still left of all the more common subjects for general instruction, and the whole deposited in one national and central museum, the result to science would be most beneficial.

1297. You think that such a collection, so completed, would be an object well worthy of the country?—I should think that it would be one of the grandest objects of the Legislature of this or any other country.

1298. Not only useful to the man of science, but beneficial to the people at large?—Useful not merely to science, but conducive to that paramount object to which natural science should be directed; conducive to the exhibition of the wisdom of the Creator in the creation. Such a collection would of course be of the greatest consequence to the study of natural theology. In point of fact, the grand arguments that have been adduced by Paley and other writers on that subject, have been deduced from observations on individual species, or their component parts. The modern improvements in science have now added to such arguments the observation of the perfection of the whole plan itself. Such a view can only be efficiently followed up by having one comprehensive museum, embracing as far as possible the whole of the species now known.

1299. When you spoke of a museum, conducted on a liberal and comprehensive plan, do those words apply as well to the Parliamentary grant as to the constitution of the Museum?—To both, I should say. In fact, the Parliamentary grant for the Zoological department ought, in my opinion, to be equal to what is given for the whole, while the constitution of the establishment itself is such that only a very small portion of that grant goes to the Zoological department. My answer thus applied both to the limited nature of the grant and the constitution of the body itself, which cannot attend to zoology while it has other important objects to attend to.

1300. Is the nomenclature generally satisfactory to you in the Zoological department?—Generally speaking, it is satisfactory; but I should certainly prefer that we had a school of our own, and that we did not follow the dictates of foreigners so implicitly as we do. I repeat that I would myself prefer that another general mode of arrangement was adopted; that we should follow our own system in consonance with the grand plan to which I have just alluded; that is, for a system exhibiting the affinities and analogies of the objects of the creation, and showing them all in one united and comprehensive view. Such a system I should, without doubt, prefer to the plans of foreigners, who generally limit their researches to the details of individual groups or species, without referring to the grand harmony of the whole. But, with reference to the mere nomenclature in the British Museum, that is, the names that are given to the individual specimens, that I believe to be very correct; of course I do not go into the minutiæ of these names; but from my knowledge of the gentlemen who superintend that department, I can state that they are generally correct.

1301. My question rather went to this, whether the system of nomenclature adopted was satisfactory to you, as a man of science?—I have not looked much latterly into the details of the nomenclature, therefore I cannot answer the question

N A Vigors, Esq.

17 March 1836.

tion with accuracy; but, at the same time, I know the general plan which is adopted, and that plan, as I have already stated, I do not think the best.

1302. Would it not, now, assist the student that the generic and specific names applied to any particular specimen by any eminent zoologist, as, for instance, Linnæus, Cuvier or Ray, should be attached to each specimen?—Certainly; and I understand they are; it is the general custom that the name of the naturalist who describes and names the individual animal is attached to each specimen. I understand this is the case in the British Museum; it ought to be so.

1303. What is your opinion as to the propriety of using the scientific or trivial name, or both, on the labels attached to the specimen?—The mode I have adopted myself, and which I should recommend to others, is that of attaching the generic and specific scientific name; I should also attach the trivial name; and I would go perhaps further, I would add the country from which the specimen came.

1304. And what habitat in that country?—Yes, if any importance was attached to the particular habitat. This latter point of locality is more particularly useful in showing the extent to which species are found. Nothing perhaps can be more beautiful in our speculations in science than to see how far individual species, or even larger groups, are spread over the globe; to what limits they are confined when stationary; how far they extend where there is migration. From such inquiries it generally appears how much each individual species or genus is fitted to the particular climate and local peculiarities of the region which it inhabits. Therefore it is of the greatest consequence to the student to mark the localities.

1305. In the Zoological collection is there any one department more deficient than another?—I think the mammalia are the most deficient.

1306. With regard to the collection of birds?—The collection of birds is rather poor compared with others. It does not contain, I suppose, the one-third it might contain, had it adequate funds, by purchase and judicious exchange. I dare say in the course of six months the British Museum might treble the numbers of the species of birds it has at the present moment.

1307. When you spoke of judicious exchange as a means of increasing it, do you think there is anything derogatory to the British Museum, were they to exchange occasionally with eminent collectors?—No, I think the very reverse; it is the object of an institution of this kind to exchange their duplicates, &c., by which means they diffuse a knowledge of science in disseminating the objects of study as widely as possible. It is of great consequence to museums in the country, which have not the means of getting extensive collections, for metropolitan institutions to send what is superfluous to them for the purposes of science; the practice, therefore, I think, is not derogatory to the dignity of the latter, but rather one of their main objects.

1308. Lord *Stanley*.] Have you ever known instances where museums in the country have offered specimens which they were desirous of exchanging, and have been refused?—I have not; no instance of the kind has come under my knowledge. In my previous answer I referred to institutions in town offering their duplicates to the country museums.

1309. Did you contemplate the offer of those duplicates by way of sale, or by way of exchange or gift?—Chiefly by way of exchange or gift; great mutual advantage often accrues by the way of exchange; for instance, some 20, 30, or 100 subjects that were rather common, and were duplicates to the institution that offered them, have been given for one or two rare specimens which the other party had, but which were not in the possession of the metropolitan institution.

1310. Do you know any instance in which the British Museum has had an opportunity of doing it, and has neglected?—No; but I think they have not an opportunity of exchanging to any extent. I should premise, by saying I know very little of the mode in which they carry on their duties at the British Museum, but I should rather think, from my general knowledge of the collection, that there were very few duplicates to be disposed of.

1311. Sir *Robert Inglis*.] In the former answer you referred to the expediency of centralizing the collections in England, by transferring the *élite* of the museum of the Zoological Society, and of the Naval and Military Museum, to the British Museum; now, without undervaluing your general object of centralization, can you state to the Committee, that either of the bodies whom you have now named, or any other society, incorporated or otherwise, would be willing to transfer the *élite* of their respective collections to another depository?—I should consider at this present moment the question would be one of considerable difficulty with those bodies

bodies, and other bodies similarly circumstanced; but I do think that were the question fairly laid before them, and that it was certain that a grand national depository would be attained, I think then, that so paramount an object would get over the present difficulty; and I have no doubt that those bodies would send the *élite* of their collection to the central depository.

1312. Would you recommend the exchange or the gift to other museums of any presents made to the British Museum in natural history, or would you consider that any gift once received by the British Museum ought to be retained in gratitude to the donor, and as an encouragement to other persons to make similar donations?—I certainly do think that an institution to which a donation was given, of the kind you allude to, has no right to dispose of the duplicates of any part of that collection, unless with the consent of the donor. The question has often come before me in my capacity of secretary to the Zoological Society, and I have invariably thought it was not right to give away any specimen which was given to the society, although there had been duplicates of it. I would add to my answer, that feeling the necessity of preserving even the most trivial gift, I invariably made it a point where a donation was offered, to state the circumstances under which we accepted it; and in several instances we have told the donor that many things offered by him in a large collection were not necessary, and we gained his consent to exchange them, or part with them, as it should seem fit to the council of the society; generally speaking, I find every person anxious to abide by the rule of his gifts being parted with if found useless.

1313. Do you consider it desirable that certain specimens should be retained, without relation to their merit as objects of science, but as furnishing historical evidence of the state of science at the time when they were presented to or purchased by the Museum; in short, as having an historical rather than a scientifical value?—Certainly there are many collections which have a value in that point of view. There are some that contain many specimens which have a still higher value, those original specimens, I mean, which form the types of species described by eminent zoologists; the collection of Linnæus, in the Linnæan Society's Museum, is particularly valuable in that point of view.

1314. You regard the individual specimens, however inferior they may be in condition, as possessing an intrinsic value from their historical connexion with the discoverer or the state of science?—In every instance I should preserve as most valuable all specimens of the kind, but I should also have others in a more perfect state, that would illustrate the characters of the species more fully.

1315. A very inferior specimen of the giraffe, for instance, would be valuable in a national collection, if it were the first specimen introduced into Europe for the last 15 centuries?—I should scarcely go so far as that, there is nothing scientific in the preservation of the first specimen that has been brought to a distant country, but if it was the first specimen that had been described by a particular zoologist, I should then, as a type of his description, and the very example from which he took his characters, preserve it as most sacred.

1316. An example combining both qualifications would, in your judgment, be justly retained in any collection, being the first introduced, and the one known to naturalists by its position in the work of the first describer?—If I were to pass my own judgment on such a point, I would say that the fact of a specimen being the first that came over, would render it a matter more of curiosity than of science; and if it interfered with the convenience of my collection, particularly in the case of so large a subject as the giraffe, I should be likely to dispose of it, if an inferior duplicate. Insects and smaller articles take up so limited a space, that I might perhaps combine the two objects together, and if a superfluous or inferior specimen were the first that was introduced, I should in all probability preserve it. There are other considerations that might make me preserve individual specimens. If I had taken them myself, for instance, under particular circumstances, I might preserve the specimens as a matter of personal interest, because they bring to my mind certain associations that are pleasing; but in point of science I would not regard any particular specimen and preserve it, because it was the first introduced, or because it had been taken or added to the collection under any circumstances of personal interest.

1317. Pray how long is it since you first became acquainted with the collection of the British Museum?—I have known the British Museum, I think, from 1819.

1318. Can you state to the Committee what is the relative value of the collections in Zoology in their different departments in 1836, compared with their state when you

N. A. Vigors, Esq.

17 March 1836.

you first knew them in 1819?—I should say there has been a great improvement, particularly within the last three or four years.

1319. The improvement has been progressive since the time you first became acquainted with the collection?—It has been progressive, but it has been much more rapid the last three or four years.

1320. Can you favour us with any detail of the comparison which you had occasion to make as to the improvement, as to the number, as to the addition, and as to the arrangement?—As far as I recollect, the exhibition of the larger animals, such as the mammalia and the birds, was extremely poor when I first knew it. The addition of larger rooms to the Museum has given an opportunity to the conservators to exhibit a considerably increased number, and to arrange them to greater advantage. That addition, I think, has taken place within the last three or four years. I cannot exactly state when the improvement commenced, but the collection has been certainly very considerably improved within the last five or six years.

1321. When you state that the collection of birds does not contain one-third of what it might by purchase in six months, will you state to the Committee whether you refer to any standard collection in any other quarter?—Six months I would give as a limit. I refer to the addition that the Museum would have in its power to make by purchase in London, Brussels, in Paris, at Berlin, and other continental towns, and which it might also get by employing collectors on its own account. When I say six months, I think that would be the time within which the addition might be obtained, with some degree of exertion. With respect to the standards to which I should refer, I should refer to what the Zoological Society has at this present moment. I should refer to the present state of the Berlin collection, and to a collection which I know more particularly, that in the Paris Museum. Knowing the deficiencies of the British Museum, in comparison with these other institutions, I should observe that those deficiencies might be filled up by judicious exertion within six months. Of course I refer to those standards; but I refer to something more than existing collections; to my knowledge of what could be obtained by collecting, that is not in any of those museums.

1322. Lord *Stanley*.] You stated just now, in your opinion, the Parliamentary grant for natural history ought to be equal to the whole grant made for the Museum?—I would rather qualify that answer, for I do not know what is the exact amount of that grant. I can make some guess of the amount, being aware of the general expenditure there; but when I said that the whole grant now given to the British Museum ought to be given to zoology alone, I spoke hastily, for I do not know what the exact grant is.

1323. You stated that the British Museum might treble their collection of birds in six months; are you able to state at all, or give any idea of the expense that would be to the British Museum?—I think that they might be procured by purchase at about 6 *s.* a bird, one with another.

1324. I should like to know the gross estimate for trebling the Ornithological department of the British Museum?—We have lately made great additions to the birds in the Zoological Society's Museum, and the price we paid was about 5 *s.* or 6 *s.* a bird; so that if we calculate the price of about 1,500 or 2,000 specimens wanted for the British Museum collection at the same rate, the amount is easily computed. I think we might add, at least, 1,500 specimens to the British Museum in six months, at 6 *s.* the bird.

1325. Does that amount of 6 *s.* the bird include the stuffing and setting up?—No, merely the skins; the setting up would be about 2 *s.* 6 *d.* or 3 *s.* 6 *d.* for each specimen.

1326. Supposing the Ornithological collection of the British Museum trebled in six months, would it then be a perfect collection, or anything approaching to a perfect collection?—It would be approaching to, but nothing like a perfect collection; we know not the extent of the resources of nature. There are parts of the world which never yet have been entered by the zoologist or collector; the entire of the interior of Asia and of Africa, great parts of America. We know that even in England, where zoologists are collecting every day, every day brings in something novel to science. How much more would this be the case in countries which have never yet been explored; in China, for instance.

1327. My question as to a perfect collection referred to a complete collection of the present known species?—In that point of view, and with reference to the present

present known species, I would say that trebling the collection would bring it to as great a state of perfection as is consistent with our present knowledge.

1328. And you are of opinion that that object might be effected in six months, for an amount of from 700 *l.* to 2,000 *l.*?—You speak of the birds alone?

1329. Of course.—Yes.

1330. Additional space would be required for the proper arrangement of the Ornithological department?—For the purpose of exhibition, perhaps double what there is at the present moment. The birds are not crowded now; to include the additional specimens it might be sufficient that the space should be doubled.

1331. That is, trebling the collection, you would only require to double the space?—So I think; as the specimens are not crowded, I think they might be shown to advantage in about double the space which they occupy at this moment.

1332. And with that additional space, you think three times the present amount of the collection might be scientifically arranged and exhibited to the public; every specimen labelled, with the generic, specific, and trivial name and description, and the country from which the specimen comes, and its habitat?—I have said so, speaking from experience.

1333. Is that your opinion?—My opinion is, that it could be done; not so very extensively, perhaps, or with so much minuteness regarding the names as you mention, because there would be much space taken up on the labels with the names; and the writing would be so small, that you would not see it to advantage on the labels in the back-ground; but you could remedy that defect by having reference to a catalogue. And when some of the specimens are placed at such a distance as to prevent their names being read with equal ease as if they were immediately before the eye, that disadvantage could be remedied by having a number attached to the specimen, referring to a manuscript catalogue, which the student can consult as to those points alluded to, of habitat and the synonymes given in the writings of different scientific persons.

1334. Now, applying your observations to mammalia, which you state also to be still more deficient than the birds, will you have the goodness to tell us what number of specimens would make that collection as complete as you desire to make the ornithological collection?—The mammalia are very deficient in condition as well as in number; and therefore I should almost say, that almost the entire number of the species that we know ought to be added to the collection. There are, in fact, very few mammiferous animals in the British Museum.

1335. What is the total of animals known, speaking of mammiferous animals?—There are about 1,200 species well described and authenticated. There may be more in published works; but in these many species are divided into two or three nominal species; being mistaken in consequence of difference of character, arising from age or accidental causes.

1336. Supposing it desirable to make that collection also complete, can you say within what time and what expense the British Museum might have an opportunity of doing so?—To make the mammalia perfect, so as to contain all the known species, would take a great deal of time; they are much more difficult to be obtained than the birds. The latter are more easy of transportation; they are more attractive, and thence more generally collected; we have consequently more facilities in getting them than mammiferous annimals. It would take considerably more time to make a perfect collection of mammiferous animals than birds.

1337. At what expense do you think a complete collection might be formed?—At more expense than birds, and the cost of setting them up also is greater.

1338. Can you give the Committee any idea of what expense?—It is a matter of calculation; but in most instances it is difficult to ascertain the relative value of the mammalia, some being extremely rare, difficult to be obtained, extremely large, and of course of more money value than the smaller ones.

1339. I should like to know if you can give the Committee any idea of the total expense which you think might be incurred?—If I were to take down a list of species, and add what I think a fair price for each, I might make it out; but I could not go into any general statement at this moment. There are, for instance, some animals that we might purchase for 2*s.*, 5*s.*, or 10*s.* each. There are, on the other hand, large animals, such as the antelopes of India and Africa, that we could not obtain for five or ten guineas. The giraffe would cost a very considerable sum, in comparison with smaller animals that are more common and more easy of transportation. Some mammiferous animals you could buy for 2*s.* 6*d.*, for others you would have to pay perhaps 50 *l.*

N. A. Vigors, Esq.

17 March 1836.

1340. You cannot, then, form any idea of the probable expense of making as perfect a collection of the mammalia as that you contemplate with regard to the birds?—Certainly not; I could make it out, perhaps, by taking some pains, but at this moment I could give you no general idea. I should say the expense would be considerably greater than that of the birds.

1341. And of course the expense of stuffing and setting up considerably greater?—I know the expense of setting up one animal, the giraffe, now in the Zoological Society's Museum. The bill for setting up the skin and the skeleton came to nearly 150*l.*

1342. For a single animal?—Yes; the work, however, was done at much more considerable expense than the British Museum, or indeed any other similar institution would be authorized to lay out. The animal died in the Royal Menagerie at Windsor, and there were modellers sent down there, who took casts of every part of the body before the skin was taken off; of course they were paid most liberally for their services, before the stuffer attempted to set it up at all.

1343. But independent of the cost of the original purchase, then, the expense of setting up and stuffing the animals necessary to make the British Museum a complete collection of mammalia would be very considerable?—Yes; but perhaps there would be no necessity for the expense of setting them all up. Men of science can refer to skins with as much benefit as to animals set up, and perhaps more so. The scientific man would prefer taking his characters from the skin in its common state than when mounted, as it generally meets with a great deal of injury in the minuter points in the hands of the stuffer.

1344. What space would be required for a complete collection of mammalia?—Very considerable space, much greater than the British Museum could afford at this present moment. I know that in the Paris Museum the curators were some time since obliged to get rid of some of their larger animals, and place many of their very best fossil remains and skeletons where they were subjected to a great deal of injury.

1345. Can you state the space which was devoted to the collection of zoology in the Paris Museum?—Not particularly.

1346. As compared with the space adapted to it in the British Museum, how was it?—There was much more space in the Paris Museum than there is at present, even with all their additions to the British Museum. I cannot exactly specify the dimensions, but I should say there is much more space in the Paris collections than here.

1347. The larger stuffed animals, with the greatest care taken of them, are to a considerable extent perishable?—Not with great care; they are by no means perishable if attended to properly; they are more liable to injury than smaller ones, but with proper care there is no specimen, great or small, that may not be preserved from destruction.

1348. I think you stated that the Museum had not one-tenth of the hands it ought; do you apply that to the present state of the Museum, or on the large scale on which you propose to constitute it?—I make a comparison between its present state and that which I should wish to see a national collection attain. I should repeat one-tenth.

1349. Therefore, in order to make the ornithological collection and the collection of the mammalia perfect, you would require a very large expense in purchases, an establishment increased ten to one, and its space infinitely beyond that which the British Museum possesses within its precincts?—Yes; but when I spoke of the establishment being increased in the ratio of ten to one, I spoke with reference to numbers and not to expenditure; and in those numbers I should also include persons without salary, and not permanently upon the establishment. Among them I would have students, as is the case in other institutions, particularly on the Continent, where men give their services for the information they obtain. I include all those when I would add nine-tenths to the present number.

1350. You have stated that with regard to the shells, you consider the collection the best in the Natural History department in the British Museum, but that still it is very deficient; are you acquainted with any public collection which is superior to that of the British Museum?—I cannot speak from my own knowledge of any public collection; I have already alluded to one private collection.

1351. How long has Mr. Cumings been engaged in making that private collection which you state to be, in a scientific point of view, ten times the value of that of the British Museum?—He was some years abroad, how many I cannot exactly say; but he was employed in other pursuits, commercial pursuits, I believe, and it

was

N. A. Vigors, Esq.

17 March 1836.

was only a portion of his time which he could devote to collecting. As to the number of years he was abroad, I can answer only for seven or eight, beyond that I can state nothing.

1352. He is a dealer in shells, is he not?—No, I am not aware that he is.

1353. Are you not aware that he has sold parts of his collection at various times?—I cannot answer from my own knowledge that he has ever sold any: I know that he has exchanged most liberally; his grand object in coming over here was to make a general collection, and by exchanging parts of his own duplicates he was enabled to increase that general collection very extensively, but whether he sold or not I cannot say.

1354. You are not aware of the peculiar terms on which his collection was offered to the Zoological Society?—I think I could venture to say what they were, although I would not pledge myself to the accuracy of the statement. In the first place his object was that they should be all exhibited, and that suitable cases should be prepared for them at the society's expense; that an inventory of them should be made out, and none be parted with without his own or his trustees' consent. He also stipulated for himself being appointed curator of those shells at a certain moderate salary; those were the chief conditions.

1355. But was his appointment as curator the only money value that was to be given for the collection?—That was all. Having sat in deliberation on this subject, I can state that this was the only pecuniary condition that was annexed; I may be allowed to add also, that the value of salary which was to be attached to the office of curator fell very far short of what he could sell the collection for at this moment, to say nothing of his services.

1356. Have you any objection to state what that salary was?—He himself mentioned 150 *l.* or 200 *l.* a year, and the council determined for the larger sum. I myself voted for the 150*l.*, but the majority of the council voted for the larger sum. Now the collection is valued by an eminent dealer at beyond 3,000*l.*; and it has been considered to have been most fairly and moderately valued.

1357. Has the transfer been made to the Zoological Society?—Not yet; the Zoological Society has the power of determining on the acceptance of the offer within the next 10 years.

1358. Sir *Robert Inglis.*] Are the Committee to understand that the use of the collection is to remain with the Zoological Society from this time, and that the annuity of 150 *l.* or 200 *l.* as the case may be, which was stipulated to be granted to Mr. Cumings, is not to commence till 10 years have elapsed?—The collection is placed at this present moment in the hands of trustees. At any period within the next 10 years, the Zoological Society may accept the offer. Should it not be accepted within that time the contract will be entirely broken off between the parties. If the society should embrace the offer, the salary will commence from the time Mr. Cumings returns to England, and enters upon his duty.

1359. Lord *Stanley.*] Had the Zoological Society any previous collection of shells?—A very small one. They had a few valuable ones which came from particular localities presented by some of our voyagers; Captain Lyon, Captain King and Captain Belcher were the chief donors.

1360. You stated that Mr. Cumings had speculated on making a transfer of those shells to the British Museum; will you explain what you mean by that word speculated?—I mean that he turned the subject over in his mind; I had some conversation with him on the subject myself, when we compared the expediency of sending them to one institution or another, and the result of such speculations was, that he proffered them to the Zoological Society.

1361. The British Museum having a very considerable collection, and having its own officers to superintend it, he might perhaps think there would be greater difficulty in accepting his offer and appointing him curator in the British Museum, than a museum where there was no such collection?—I never heard him make use of any such observation; it might perhaps have come into his head, but I do not think it was in that point of view that he formed his judgment.

1362. That being the sole condition that he insisted on in a pecuniary point of view, do you imagine that condition could have been easily complied with by a museum which had officers of its own and curators of its own?—His grand object was not pecuniary compensation; it was to see a collection in which he felt great interest and great pride, exhibited to the best advantage; and the condition of his being curator to that part of the Museum was for the purpose of having the utmost justice done to it. He thought that his own exertions and superintendence would

N. A. Vigors, Esq.

17 March 1836.

benefit the collection, perhaps more than that of any other person. I take for granted, and indeed know, that those were his grand objects.

1363. With that view he would rather offer it to a society where the previous collection was poor, than to a society whose previous collection was very rich?—That is a matter of opinion. The grand object in his preferring the Zoological Society as the depository of his collection, was, as far as I know, that he considered that more benefit would arise to science in general, and that his collection would be done more justice to than if it was sent to the British Museum, which could not do it equal justice under its present state.

1364. Will you explain why the British Museum in its present state could not have done equal justice to his collection, as the Zoological Society?—It is difficult to explain his speculations on the subject. Perhaps he could not give the best reasons for his judgment on the occasion. He imagined, however, I think, that in the Zoological Society there was a more likely prospect of its being able to form a general and grand collection, than there was in the British Museum in its confined and limited state. If I had the same collection as Mr. Cumings to dispose of, I should come to the same decision that he did.

1365. Will you state what you mean by its confined and limited state?—I mean that it has not the power of making those grand collections in zoology which it ought to have as a National Museum; that it has not the funds for doing so; nor can the same attention be paid to the Zoological department by the Trustees which would be paid to a collection in zoology, where all the governors were zoologists.

1366. In short, your opinion then is, that for the interests of zoology it is better that those collections should be in a separate establishment, and not mixed up with various other scientific objects which may distract the attention of the governing board?—Decidedly so.

1367. Mr. *R. Colborne*.] Did I understand you correctly just now, when you said you would recommend the removal of the Zoological department?—Certainly; I should recommend that zoology should be kept separate from every other science, unless the sister sciences in natural history. If it is mixed up with others more attention will probably be paid to these, and zoology may become a subordinate branch. In the British Museum, zoology was at first the grand and chief object of the institution; by degrees others superseded it, and it has now become the most neglected part of the establishment.

1368. Would an institution like the British Museum be deemed otherwise than very imperfect without any natural history establishment?—I should certainly say that the British Museum has objects sufficient for its attention, objects more immediately connected with literature, without extending to such branches of science as zoology. I should also wish to separate the fine arts entirely from the British Museum, and confine it to literary subjects, to literature in general in all its branches.

1369. You would contemplate a great national institution devoted to the subject of zoology?—I would; but would extend it also to the other branches of natural history.

1370. That is, an institution for which Parliament should vote four or five grants, similar to what are now granted to the British Museum?—Yes; my views are, perhaps, extravagant, but a nation such as England ought to have separate institutions embracing on a grand scale all the objects to which I allude. In France they have such establishments: there is the Louvre, the Jardin des Plantes and the Bibliotheque du Roi devoted, in separate departments, to the fine arts, to natural history, and to literature in general.

1371. You think, however, progressive improvement has been making within the last few years, ever since the accommodation has increased?—Considerable improvement has taken place.

1372. Is progressive improvement every year going on?—Certainly; I cannot say it is going on up to the present moment; I have not seen the Museum for some months; but it is likely to go on under the present efficient officers.

1373. Mr. *Hawes*.] You have been asked whether the British Museum had neglected any opportunities of improving their collection by means of exchange?—Yes.

1374. Does it come within your knowledge whether the Museum has ever attempted to improve their collection by means of exchange?—It has not come within my knowledge; but I do not think they have much material for exchange.

1375. Did you ever hear of any attempt on their part to negociate exchanges with

with any eminent collector?—Such an attempt has not come within my own knowledge.

1376. You have stated it as your opinion, that if a donation is accepted, it shall not be sold without the permission of the donor?—I think that, if accepted, it ought not to be parted with without the permission of the donor; in accepting the donation, some condition should be made with the donor in case of the gift becoming useless, or superfluous, or inconvenient to be kept.

1377. We have been told by a witness that Sir Joseph Banks presented the skull of a rhinoceros and the skull of a mammoth to the British Museum. The same witness has told us, that when the Emperor of Russia was expected in this country in 1814, that Sir Joseph Banks, recollecting those specimens, because he supposed the Emperor, who looked sharp enough about, would inquire for those specimens, which were not to be found there; we are told by the same witness, that these specimens had been sent to the College of Surgeons, and at the particular request of Sir Joseph Banks were again sent back from the College of Surgeons to the British Museum, to be exhibited as a part of the national collection: do you think the Trustees acted with due discretion in that transaction?—If I had been a Trustee I should not have consented to have sent those specimens to the College of Surgeons or any other body.

1378. Do you think, speaking as a man of science, it affords encouragement to the presentation of valuable specimens to the British Museum?—Certainly not; I should think the knowledge of such a fact would rather discourage such donations.

1379. And if they were specimens unconnected with any general collection, do you think that would materially alter the case?—If they had been specimens unconnected with the general collection, that is, if they were duplicates, perhaps it would not have been of so much consequence; but if they were, as I take it for granted, specimens of value, and such as formed part of the general scientific collection, the parting with them was a serious loss.

1380. Lord *Stanley*.] Do you know anything about this transaction beyond what Mr. Hawes has stated to you in his question?—I have heard of it before. When I stated in a previous answer that I knew nothing of exchanges offered by the British Museum, I meant I knew nothing of my own knowledge; I had heard of such things before, as I have heard of this transfer.

1381. The whole opinion that you have expressed with regard to this transaction is founded on the information given to you by Mr. Hawes, in the question just put?—I had heard these things mentioned before; but my answer was to the question, if so and so were the case. I gave an abstract answer to an abstract question.

1382. Mr. *Hawes*.] Your answer was on the assumed truth of the facts of the case?—Yes, taking it for granted that such and such were the facts, my opinion was formed on that hypothesis.

1383. Mr. *R. Colborne*.] With reference to those very specimens, do you think they would have been as well placed in the British Museum as in the College of Surgeons?—I should say in a national collection of zoology such skulls were of the utmost importance and value. They are also of great use to the College of Surgeons, but I should be sorry to deprive a national collection of zoology of what is so essential to its integrity and perfection.

1384. And therefore you think they could not well be parted with?—It would be very injudicious to part with them; it would be cutting off a very important limb of the whole.

1385. Mr. *Hawes*.] Do you think it expedient or not to form a complete zoological collection at the British Museum?—I do not think it could be attended to with the justice that ought to be bestowed upon it at the British Museum; I should prefer, as I said before, that the National Zoological establishment should be kept apart.

1386. Then, upon that opinion, do you think it expedient to continue to make small additions from time to time to the collection which may never be completed in consequence of the expense or the space that may be necessary?—If there was any prospect of there being a grand depôt for natural history, I should think it would be injudicious to make many additions to the collection while it remained in its present situation.

1387. Are you aware that very extensive buildings are now being undertaken by the Government, conjointly with the Trustees, for the accommodation and exhi-

N. A. Vigors, Esq.

17 March 1836.

bition of the collection?—Yes, I am aware that very considerable additions are making to the buildings of the Museum.

1388. Do you think it expedient those buildings should be continued on the assumption that the natural history collection would be exhibited in them, which may never be completed by reason of the expense and space that it would require?—I think it very important that the point should be decided whether zoology is to be separated from the Museum and a national collection be established elsewhere; if there is such a prospect, it would be injudicious to devote any new buildings at the British Museum to zoology.

1389. Do you not think in erecting a building for a national museum, that it is important that some eminent zoologists should be consulted as to the probable addition required, and the best means of exhibiting the collection?—Certainly zoologists should be applied to; their judgment ought to be sought on such an occasion.

1390. Supposing the present management of the Museum to continue, do you not think that purchases in the Natural History department, if they are made at all, should be made on some well-digested and well-connected system?—Certainly, they ought to be on a well-digested system; all purchases should be made according to some general plan, which the purchasers previously lay down for themselves.

1391. You think it expedient that some plan should be laid down, in order that the Trustees might be governed in their purchases, and that that plan should be adhered to?—Certainly.

1392. You have stated that Mr. Cumings preferred the Zoological Society as the depositary of his collection, because the curators of it were zoologists?—I think that was his reason; he knew that the collection would be under the care of zoologists, who he imagined would pay attention to it, and exhibit it to the advantage of science; that I believe to be the chief reason of his preference.

1393. Do you know who are the Trustees of the Museum at present?—I have got the list before me and see their names.

1394. Is there any eminent zoologist amongst them, who might be supposed to be useful in arranging purchases for the Zoological department?—I see many patrons of zoology; but, with one exception, none who have paid particular attention to zoological science; that exception is the present president of the Zoological Society, the Earl of Derby.

1395. Is the Earl of Derby an elected Trustee or a family Trustee?—He is an elected Trustee.

1396. Lord *Stanley*.] You stated just now that you think a collection ought to be made on some system previously laid down?—The question was, how should purchases be made?

1397. Yes; that purchases should be made according to some principle previously laid down; is that the case in the Zoological Society?—Yes.

1398. Will you have the goodness to explain that?—We ascertain the particular species or specimens in which we are deficient, and our plan is to purchase those only; we purchase no duplicates or specimens that we do not want. That is one part of the plan on which we make our purchases.

1399. In what way does that differ from the plan pursued by the British Museum; do they purchase duplicates?—I do not know what the plan of the Museum is; my answer was directed to the plan which ought to be followed by any purchaser.

1400. Then the general principle that you mean to have laid down is, that merely opportunities should be taken as they occur, of purchasing such specimens as are deficient, and not purchasing duplicates?—That is a part of the plan which I should lay down for myself if I were in the position of a purchaser. I should lay down other rules, perhaps, such as that of purchasing nothing but what was in the finest condition, except the subject be very rare, and then perhaps I should be inclined to buy an inferior specimen.

1401. You are not aware of the principle which has guided the British Museum in making their purchases?—I am not at all aware.

1402. Sir *Philip Egerton*.] In the observations you have made, have you included the articulata, the radiata and mollusca, or only the mammalia and the birds?—I was asked particularly respecting those latter branches; but my observations are meant to extend to every part of zoology. With respect to the objects that a national collection should embrace, I consider no one department as inferior to the other.

1403. Would you also include the organic remains?—Decidedly; our attempt to

N. A. Vigors, Esq.

17 March 1836.

to exhibit the system of nature would be very imperfect, unless organic remains are included in the collection. The links in the order of nature appear very much interrupted, if we confine our views only to recent species. A great number of chasms occur which are filled up by organic remains.

1404. Then your observations refer to every department of zoology in the British Museum, including the organic remains?—Yes.

1405. Are you well acquainted with the collection of British birds, British shells, and British crustacea?—Not equally with all; I am well acquainted with the British birds, but I am not so well acquainted with the shells and crustacea.

1406. What is your opinion of the collection of British birds?—It is a very good collection; any local collection, and particularly a British one, being well known and limited, may easily be filled up, and this is the case in the British Museum, with the exception of a few of the rarest species.

1407. As far then as the British birds are concerned, the Trustees have not shown any backwardness in procuring specimens likely to be most interesting to the British public?—I do not know that they have shown any backwardness, on the contrary, from the specimens I have seen, I should say they have been anxious to increase that collection. I should prefer myself, I must own, to pay less attention to particular or local collections; I should endeavour to make the general collection perfect, or approaching to perfection, rather than devote particular attention to any particular department to the detriment of others.

1408. Do you not consider that the collection of British birds, as the national collection, should be as perfect as possible?—I think it is certainly of much interest and importance; but men of science are, generally speaking, cosmopolites; they look to the science of the world, and not to that of any particular part of it.

1409. Then do you consider the British Museum as a collection exclusively set apart for scientific investigation?—I should consider that the national collection ought to have chiefly in view the advancement of science, but at the same time I should be very much inclined to make particular parts attractive, for the purpose of alluring students to the science. Many a man by having access to a collection of British animals, has been inclined to extend his researches further; and thus has gone on from one step to another until he has been enlisted in the ranks of science.

1410. Mr. *Hawes.*] You have said that the Earl of Derby is an elected Trustee of the British Museum?—Yes.

1411. Do you know any commoner eminent in zoology, who has been elected a Trustee of the British Museum?—There are none here in the list before me, from which my knowledge of the Trustees is acquired. I see none who are eminent zoologists. There are great patrons of science in the list, of whom I have the pleasure of seeing one before me at the present moment, but I believe his attention has not been directed to that particular portion of science.

1412. Mr. *Compton.*] Do you or not think that zoology in the British Museum is sufficiently represented among the Trustees of the British Museum?—I should say certainly not. I see in the list but one zoologist, as I have already said, Lord Derby, and that nobleman, from his numerous avocations, and being absent almost constantly from London, I should think is not able to give that attention which a Trustee representing that branch of science should give; his Lordship, therefore, being the only zoologist on the trust, I should say zoology was not sufficiently represented; if he were able to give his undivided attention to it, or a great portion of his attention, no man could represent it better.

1413. Sir *Robert Inglis.*] What is your opinion as to the state of the collection of the fishes of the Museum, as compared with any other collection known to you, or your own abstract standard of perfection?—According to my own abstract standard of perfection it is very inferior; but, on the whole, I considered it on my last visit as very superior to what I imagined it had been; I saw great improvement.

1414. Can you state whether that improvement be progressive, as far as you have the means of stating it?—I have not the means of stating the progress of that particular department; I never paid particular attention to it; my answer now refers only to the one visit which I made last year.

1415. Will you state to the Committee your opinion of the relative value of the crustacea?—I cannot say that I paid particular attention to the crustacea on that visit.

N. A. Vigors, Esq.

17 March 1836.

1416. Or the corals?—They appeared to me pretty good; generally speaking, they were a very instructive collection, but, according to our abstract views, very inferior to what zoologists would wish them to be.

1417. Are you giving the result of your general observations collectively during a series of years, or on one particular investigation prosecuted for the particular purpose of giving evidence before this Committee when it was first formed last year?—My observations are collected perhaps from both sources; my early and continued knowledge of the Museum, more particularly corroborated by the visit of last year.

1418. Mr. *Compton*.] I should like to refer you to the answer you gave some time since with reference to the nomenclature; you said you should prefer having a school of your own; will you explain that expression?—Hitherto we have followed almost implicitly in public institutions, and indeed in private collections, the nomenclature of some eminent foreigner; Cuvier in some branches, Temminck, Lamarck and Latreille in others. I conceive we ought not to defer so implicitly to the system of nomenclatures of these gentlemen, however eminent they may be, but have a system of our own, including all the best parts of the foreign systems, but still modified according to our own particular views.

1419. You mean that you would have a school of English nomenclature in preference to the Linnæan or Cuvierian nomenclature?—Decidedly in preference to the Linnæan, which, however valuable in its own time, is ill adapted to the present state of science. With respect to the Cuvierian nomenclature, improvements have been made in it as well as others.

1420. Do you not think, if such a system were adopted, that every succeeding person, or any other person who might succeed in the management of that department in the British Museum, would adopt a different nomenclature?—I should think the adoption of the nomenclature would rest with the governing body; and that would be directed according to the new improvements of science.

1421. Your plan would be to have some superior officer over each department, and that he should have the power of making his own arrangements?—Great deference would probably be paid by the ruling body to the officers in charge of each department; but it would rest with that body to decide as to the system to be adopted. The details of following that up would rest with the individuals placed at the head of each department, obeying the directions of the governing body. I consider that the system would not be fluctuating, although modified according to the new views of science.

1422. If such a system were adopted, would it not greatly delay the making any catalogue?—I believe not; if a body of zoologists were to meet together at this present moment, I think they could lay down the rules to be adopted in a very short time; it would cause no delay.

1423. Mr. *Hawes*.] What do you think of the importance of forming a catalogue of the zoological specimens of the British Museum at present?—It would certainly be of the greatest importance; the great perfection of the collection, if I may say so, would be the catalogue.

1424. Do you think if zoologists had sufficient influence in the Board of Trustees at the Museum, could it have continued so long as it has without an entire and perfect catalogue of that collection?—I consider if the department of Zoology were better represented among the Trustees, considerable improvements would have taken place beyond what have taken place.

1425. Are there not numerous scientific writers, by following whom a very useful catalogue might be made, for instance?—There are writers of great reputation, whose views may be followed to very great advantage.

1426. Do you think any difficulty to the future arrangement of the entire zoological collection could possibly occur, by giving a number or name, or both, to every animal in the collection, corresponding with a numbered catalogue in which the synonymes and name of each individual should be noticed?—So far from being an impediment to the perfection of the future arrangements, it would be a considerable step in advance towards that arrangement.

1427. Looking at the question now as one mainly of profit and loss, do you think such a catalogue would meet, among scientific men, with such encouragement as would compensate the expense which must necessarily be incurred in the formation of it?—I am afraid that works of pure science are not likely to be very productive of emolument, and I rather fear that the expense would not be likely to be

be defrayed. Men of science are but few in number, and not able to purchase much; few works of mere science pay their own expenses.

1428. Are you at all acquainted with the catalogue of the College of Surgeons?—I am; I possess myself the first part; I am not aware of any subsequent part having appeared.

1429. Are you aware that that catalogue is published in parts?—Yes.

1430. Do you not think by adopting a similar plan that the probability of sale might be increased, by collectors purchasing that part which more especially related to their pursuits?—Certainly; the plan generally adopted by publishers of scientific works, is not to publish those which contain a mass of matter, and of which few purchasers would take the whole; some persons will like to purchase a particular department, and not the others. Of course the most judicious way, and that generally followed, is to publish in parts suited to the particular wants of each.

1431. Do you or not know the hours during which the Museum is opened at present to the public?—From ten till four.

1432. Do you think it expedient or not to extend those hours during the summer months?—I should be much better pleased if they were extended, it would suit the convenience of many persons to have them extended.

1433. What is your opinion as to opening the Museum on great public holidays, such as Easter or Whitsuntide?—As far as I can form a judgment on that point I should be most anxious to open it at such times. I think a vast class of persons would go there on those occasions who could not go there on others, and my wish would be to open the exhibition as widely as possible, and to give those persons who could not attend on other days, an opportunity to attend on those particular holidays.

1434. You do not anticipate any injury occurring to the collection from a more extended time of exhibiting or from opening the Museum on great public holidays?—From the experience I have had myself in exhibitions, I have found that the class of persons who would be likely to come in on those occasions are the least likely to do injury. I can answer that no injury has ever occurred in the Zoological Gardens from the admission of the thousands that visit them on certain holidays, of the class of persons who can only attend on holidays.

1435. They are open on a Sunday?—Yes, to the fellows, not to the public.

1436. Sir *Robert Inglis.*] What are the hours of opening the museum of the Zoological Society?—The hours were, I think, from 11 till 5, an hour later both in opening and shutting than the British Museum; I believe they are now from 10 to 5. My previous observation referred to the Zoological Gardens.

1437. Is the collection of the Zoological Society open at night or in the evening?—It is to the members.

1438. But not to the world generally?—No; it closes to the public at five.

1439. Lord *Stanley.*] And opens at 11?—I think it was formerly from 11 till five.

1440. Mr. *Hawes.*] As to the expediency of extending the hours of exhibition both during the summer and winter, when in the latter case artificial light must be used, what is your opinion?—I should wish myself to have every opportunity for exhibition in the evening by artificial light as well as in the morning; I should extend the time of exhibition as widely as possible.

1441. Sir *Robert Inglis.*] Practically, you, as secretary to the Zoological Society, have not adopted, or recommended the adoption, of the plan of opening your museum by artificial light at any period of the year?—No, for in fact our museum was never much resorted to; and if such a question had come before me at the time I was secretary, I should have recommended that it should not be exhibited, and that we should not go to the unnecessary expense of lighting it up.

1442. Do you not think it would pay as an object of commerce to open the Zoological Society?—I do not think our museum has hitherto been attractive enough to pay the expense of lighting; but my former general observation applied to a large national museum, which ought to be exhibited at all seasons, and be open to the public as widely and as generally as possible.

1443. Mr. *Hawes.*] You have stated that the Zoological Society's Museum is open during the evenings of the summer months to students and men of science?—It is open at all times to students and men of science, and to the fellows of the society, who have the privilege of taking their friends there.

1444. Sir *Robert Inglis.*] Not by candle-light or artificial light?—I have myself

N. A. Vigors, Esq.

17 March 1836.

myself been there at various times by candle-light, when I have introduced scientific men and friends, but it is not a general custom; I found, however, that it was very necessary at times to attend there at late hours. On occasions, when foreigners were in this country, or men of science with limited time, I have gone frequently of an evening by candle-light, and showed them the museum.

1445. Mr. *Hawes.*] Suppose some such plan as this should be proposed for the future management of the British Museum, that the Trustees should consist principally of Trustees appointed by certain learned societies; that they should have the absolute appointment of the principal officers or professors; that the professors should form a board for the government of the Museum; and that such professors should be obliged to give lectures, and in return, having a salary, should be allowed to take pupils, using the national collection to aid them in their pursuits; what would be your opinion of such a scheme?—I think that such a plan would be a very admirable one; perhaps with some modification it might be still better; but, looking to the general outline, I should say it was an extremely good plan.

1446. You do not think that a board of scientific men would be liable to such jealousies or rivalries as to prevent their acting together for the general good government and management of the Museum?—Certainly not; there may be a good deal of rivalship among men of science, as there is among men of every other class; but at the same time it would never interfere with the interests of the institution over which they presided.

1447. Do you not think that if the representations made to Parliament for more extensive grants of money came backed by the opinion of the most eminent men of science in the country, that they would be more likely to be attended to than they have been hitherto?—I think they ought to be more attended to; and if I were to speculate on what the Legislature would do, I should say they would be attended to.

1448. Do you not think that such opinions in favour of a more extensive grant would furnish the friends of science with stronger arguments than they now have for advocating the grants to the British Museum?—Certainly. I beg leave here to refer to an answer I gave Lord Stanley a short time ago respecting the sum that I should wish to be given to the British Museum as adequate to the wants of the Zoological department. I was not aware at the time of the precise grant that was given to the British Museum; since then I have ascertained that it averages about 15,000*l.* or 16,000*l.* a year. I should at once determine on that as the sum which ought to be given to a National Zoological Museum.

1449. Sir *Robert Inglis.*] From your experience of the working of the system in which men of science constitute the governing board, as in the Zoological Society, do you conceive there is less jealousy and more prospect of co-operation in the management of its concerns, than is to be found under the existing management of the British Museum?—From my knowledge of the mode of working in the Zoological Society, I should certainly say that no detriment to science would accrue from any jealousies or dissensions among the individual members. A vast deal has been done in the Zoological Society for the science, and yet there has been a great deal of, I will not call it jealousy, but difference of opinion, among the individuals who compose the ruling power in that body; the working of the system, on the whole, has been productive of beneficial effects.

1450. Lord *Stanley.*] You have had two or three stormy meetings, I believe, at the Zoological Society?—With respect to science there have been no dissensions; the dissensions that have taken place at those stormy meetings to which allusion is made, were upon other subjects; the disposal of money, for instance, and the management of the gardens and the farm, all of which were entirely independent of science; those dissensions were in the general body, not in the ruling body.

1451. Mr. *Hawes.*] In those alleged differences in the Zoological Society, were they exclusively confined to the men of science belonging to that society?—No, indeed I should say there was very little dissension among the men of science themselves. The leading members on both sides in the contentions that took place, were men that I should not call men of science.

1452. The rivalries and jealousies of the society, supposing them to have existed, pervaded, I believe, all ranks?—Yes.

1453. Sir *Robert Inglis.*] The governing body consists of men of science, I believe, in the Zoological Society?—No; at this present moment the proportion of men of science in the council is not equal to those who are not men of science.

1454. Do

1454. Do you think that the cause of science may be promoted by a body not consisting of men of science chiefly?—The interests of science, as connected with the Zoological Society, are generally placed in the hands of scientific men; some of whom are on the council, and some not. I speak of the theoretical labours of the society.

1455. The other members of the council who were not men of science have been willing to take the advice of the men whom you describe as men of science?—On points of science the men of business defer always to the representations of the men of science; and the men of science, who are, generally speaking, not men of business, leave the business parts of the society in the hands of those other members of the council.

1456. Do you consider that a governing body, in which there may be men of business willing to take the opinion of men of science, may conduct satisfactorily the concerns of a public institution connected with science, literature, or art?—I think such a body might satisfactorily conduct the concerns of an institution constituted like the Zoological Society. In that society there are men of science sufficient to carry on the scientific part of the institution, and men of business who attend to the business part of it. But I should say, if they had other objects connected with their duties besides the science of zoology, that neglect would be very likely to take place in some department; as the society is now constituted, both parties, men of business and men of science, are looking to the one main object of the institution. The business that comes before those who are exclusively men of business is still conducive to science; both parties, the practical and the theoretical men, have one grand object in view, which is the advancement of zoology; and as such, they are likely to work harmoniously together.

1457. Mr. *Hawes*.] The present Board of Trustees for the British Museum consists of 24 elected and family Trustees, and 24 official Trustees; supposing the official Trustees were replaced entirely in the way proposed in a former question, namely, by their being appointed by learned bodies, do you not think that a board so constituted would unite the advantage of men of rank and men of science?—I should think it would be a very great improvement certainly; in looking at the official Trustees, it strikes me that it is absolutely impossible that the attention of the individuals could be directed to the management of such an institution as the British Museum, so far as zoology is concerned. I should say that very few of them would be likely to be zoologists, but at all events their official duties are of such a nature, and would so absorb their attention, that they could not bestow a direct attention to the British Museum, or any similar institution; they are chiefly the Ministers of State.

1458. Sir *Robert Inglis*.] The answer last given with reference to the exclusion of official Trustees probably does intend to separate from the official body such members as the President of the Royal Society, the President of the College of Physicians, the President of the Society of Antiquaries, and the President of the Royal Academy?—No; I should advise that the President of the Royal Society, the President of the College of Physicians, and the President of the College of Surgeons, whose name, however, I do not see here among the Trustees, should belong to the governing body, with reference to the Zoological department, and with reference to the other objects of the British Museum, the President of the Society of Antiquaries and the President of the Royal Society ought to be included on the list of Trustees.

1459. Lord *Stanley*.] In the Zoological Society you have a body called the committee of science?—We had; but that body does not exist at present; it did exist for one year, and then it merged into the general body of fellows; the name was found inconvenient: the committee of science was in fact what in Parliamentary language may be called a committee of the whole house.

1460. Was there not a committee of science in which a very small portion of the members were members of the council, and which body reported to the council?—On certain branches of science there have been particular committees instituted on particular occasions; but the general committee alluded to, which published proceedings for one year, was actually a committee of the whole society; the term committee was used as a mere distinction between the general and the scientific meetings of the society.

1461. Do you mean that every member of the council was a member of that committee?—Yes, and every member of the society was also a member of the committee.

N. A. Vigors, Esq.

17 March 1836.

committee. The appellation of committee was found to be inconvenient; and its meetings were afterwards called scientific meetings of the society at large.

1462. Am I to understand that there neither now is, nor at any time was, a body limited in number called the committee of science, apart from the council, and reporting to the council?—There has been a committee of the museum, which has been a select body; but I do not know that there ever was a committee of science. We have contemplated many times having various committees and separating into different branches, but I do not remember that there ever was a select committee of science formed.

1463. What would the committee of the museum consist of?—The first museum committee appointed consisted partly of members of the council and partly of members of the society at large; that body sent in a report and ceased to exist. There was immediately afterwards formed another museum committee, consisting only of members of the council; that is at present in existence, it consists of nine members of the council.

1464. Was that body called a committee of publication?—No; there was a committee of publication also, which attended to the published works of the society, that at present exists.

1465. Then the practice has been to constitute committees, not necessarily members of council, to superintend particular branches and report to the council, by whom their proceedings were controlled?—It was the practice for a time, and I am sorry the practice was not more generally continued. I should be much better pleased that our committees were not confined to members of the council alone, but included also members of the society at large.

Jovis, 24° *die Martii*, 1836.

MEMBERS PRESENT.

Mr. Ridley Colborne.	Mr. Hawes.
Sir Robert Inglis.	Mr. Marshall.
Sir Philip Egerton.	

MR. RIDLEY COLBORNE, IN THE CHAIR.

Robert Edmond Grant, M. D., called in; and further Examined.

R. E. Grant, M.D.

24 March 1836.

1466. Mr. *Hawes*.] WHAT do you consider to be the great objects of a national zoological museum, assuming the department of Natural History in the British Museum to be viewed in that light?—I should think the chief object of a great national zoological collection is to exhibit the natural forms and other external characters of all kinds of animals; to explain, as far as can be done by specimens, their history and habits; to inform the visitors regarding the habitats of animals; to explain by their names what they are especially; and to point out, by methodical arrangements, the natural affinities which exist among different species and tribes of animals.

1467. Do you think the Natural History department of the Museum at present fulfils any one of those objects completely?—No; after a thorough examination of its contents, I do not think that it fulfils any one of those conditions.

1468. Have you been able to discover whether any method of classification is followed in the arrangement either of the dried specimens of mammalia or of those preserved in spirit?—There is no strict method of classification followed, either in the dried specimens of mammalia or in those preserved in spirit; the species of different orders are mixed in confusion through the apartments.

1469. Have the more conspicuous specimens of either of those classes their scientific names attached to them?—There are very few that have their scientific names attached to them: those named have generally the vulgar names alone.

1470. Sir *Robert Inglis*.] Does that answer refer to the more conspicuous objects?—Especially to the more conspicuous and larger quadrupeds throughout the apartments, which have almost always the vulgar names alone attached to them.

1471. Mr. *Hawes*.] Take the class of mammalia, for instance; have the majority of the specimens any names attached to them?—By far the greater number of the mammalia have neither their scientific nor their vulgar names attached to them.

At

At the present time not a quarter of the specimens have any names whatever attached to them.

1472. Can you state the proportion which the named specimens bear to those without names?—My observations upon the state of the naming in the collections have all been taken within the course of this month. I beg leave to make that previous remark, because I observe that the numbers marked on some of the cases have very recently been altered, and the officers have inserted the names of animals in the course of this month, since some of my calculations were made out. Of about 43 squirrels which are exhibited in the Saloon, three specimens only have names of any kind attached to them. Of 21 hares and rabbits, only four specimens are named. I shall take, however, some of the entire cases: in Cases 1, 2, 3 and 4, there are 41 specimens of quadrupeds, of which 16 are named; in Cases 5, 6, 7, 8, there are 43 specimens of quadrupeds, of which 15 are named; in Cases 12, 13, 14, 15, there are 37 specimens, of which only 13 are named; in Case 25, containing 31 specimens of bats, two specimens only are named; in Cases 28, 29, 30, there are 46 specimens of bats, of which only three are named; in Case 21, containing 80 quadrupeds, 14 are named; in the Cases of the Saloon, marked 18, 19 and 20, there are 24 specimens of quadrupeds, of which two specimens only are named. I might mention others, as those preserved in spirit, to show the imperfect state of the naming in this class of animals.

1473. To what should you be inclined to ascribe this condition of the mammiferous collection, by which the most interesting portion of the Zoological Museum is rendered almost useless to the public and to the student?—I perfectly concur in the opinion that a great part of the collection, especially of this interesting class, the mammalia, is rendered useless to the public and to the student, by the want of names to the specimens. It has been frequently stated to this Committee, by the head of the Zoological department, that when the zoological staff is stronger the objects will be rendered more useful to the public, that the names will be attached to the specimens, and the zoological collection thus generally improved. I believe that the principal cause, however, must be ascribed to the want of attention or skill on the part of those Trustees whose duty it was to inspect, at different times, the state of the collections, and to point out to the officers the parts of most importance to be attended to, in order to render the collections more useful to the public. Perhaps a want of regard to this part by the Trustees has left the officers to work upon matters which they might think more interesting, and to leave that which the public and the student must equally feel to be one of the most important parts to be first attended to in a public museum.

1474. Then you attribute the state of the collection to the want of sufficient assistance?—Principally, I think, to the want of attention or skill on the part of the Trustees, in not pointing out to the officers that the state of the greater part of the collections in the British Museum was such as to render them almost useless to the public, and in not affording the officers of the Museum the necessary hands to bring the zoological collections to a useful state.

1475. Should you consider such names as simia satyrus, simia troglodytes, lemur volans, myrmecophaga capensis, ursus meles, canis hyæna, mustela lutra, didelphis pygmæa, didelphis petauras, and many others which are to be found in the printed Synopsis of the Museum, and some of which are attached to specimens of the Museum, as proper scientific designations for the several animals, or as terms generally adopted by the naturalists of the present day?—The terms which have been just read are the antiquated names of Linnæus, which are not suited to the present state of zoology; but this is to be found in several other parts of the collection as well as in the mammalia.

1476. Sir *Robert Inglis.*] Is the name of Linnæus, or the initial letters referring to Linnæus, affixed as an authority for such designation, in the specimens to which you have now referred; is the letter, or the first four letters in the name of Linnæus, or the full name of Linnæus, to be found on the specimens?—I am not quite sure, but I should suppose it is likely that they are.

1477. In short, the specimens so designated have the authority of Linnæus for such designation?—Very likely, as they are the antiquated names of that author. (On re-examining the specimens, I find that there are very few which have any authority quoted for the names given them in the Museum, and those of the two orangs especially have no reference to Linnæus for the antiquated names assigned to them.)

1478. Mr. *Hawes.*] But still they are not the names which the more modern writers

R. E. Grant, M.D.

24 March 1836.

writers on zoological subjects would affix to specimens in the Museum?—Certainly not, while they stand alone, as in the cases referred to, but only as synonymes for the more proper modern names are they now tolerable; they are so used in several works as synonymes.

1479. Are the birds described by name in the Synopsis of the Museum?—Not a single species of the general collection of birds is named by its scientific designation in the Synopsis.

1480. Are they generally named in the collection?—Not nearly a quarter of them are named in the general collection.

1481. The collection of birds occupies a much larger space than that of almost any other department of the Museum, does not it?—Both the general collection and the British collection of birds are spread over a most disproportionate space in the British Museum, to the great injury of other equally important parts of the collection, many of which are entirely concealed from the public, from an alleged want of space to exhibit them.

1482. Sir *R. Inglis.*] Are the birds in the new building, and the other objects to which you refer in the old building?—The other parts of the Zoological collection are chiefly in the old building.

1483. *Chairman.*] Have you been sufficiently acquainted with the Museum to be aware that the Zoological department was in the worst state of any, owing to the total want of room, till the new buildings were made?—I believe that it was in a much worse state till comparatively a recent period.

1484. Since the erection of the new buildings, has not a most rapid and progressive improvement been made in the Zoological collection?—In what relates to the mere exhibition of the birds, and the mere exhibition of the shells, an improvement has taken place; but they are spread over a most disproportionately large space, while other parts of the collection are crowded in confusion or altogether concealed.

1485. Are they not altogether preserved better and arranged better, and the whole management infinitely improved, and as much improved almost as the time would enable the Trustees and managers to do?—Certainly not, in so far as the Trustees might have done; because, in place of the general collection of birds being still left useless to the public or to the student, the Trustees might long since have given sufficient aid to have brought at least that part of the collection to be somewhat useful to the public, by having the specimens named. A period, I suppose, of three or four years now has elapsed since the new arrangements were made; and judging from the distribution of the labels, and from the rate of naming in the general collection of birds, not nearly a quarter of the specimens are named.

1486. Mr. *Hawes.*] A large proportion of the collection of birds is already placed in the new buildings, is it not?—I am not aware that there are any specimens excluded now from it; they are spread over a space sufficient to hold double the number.

1487. Speaking of that proportion of the collection of birds which is now placed in the new building, is that in such a state, with reference to the naming of the specimens, as to be either satisfactory to the general visitor or useful to the student?—In so far as the general visitor usually desires to learn at least the names of the birds and their habitats, I conceive that every step which he makes through the general collection must be to him in the highest degree unsatisfactory. He in vain looks for the names sometimes of fifty or sixty specimens together, which have not a single name attached to any one. He may have a species to identify in his own possession, and he may find not only that that species is nameless in the Museum, but that none of all the species approaching to it have any name whatever attached to them.

1488. Do you think that such would have been the state of the Ornithological collection of the British Museum at the present time, if the Trustees had properly defined the duties of the several officers of the Zoological department, and had assigned competent officers to the exclusive care of distinct collections?—Certainly not; it appears to be the chief cause of the present deplorable state of most of the collections in the British Museum, recent and fossil, that there have not been appointed by the Trustees to the several Zoological departments gentlemen who had been previously eminent in those several departments, and distinguished for their knowledge in them. In fact, each officer in the Museum is subordinate to the other, and they all labour at everything. They appear to have come in succession into the British Museum from other departments having no relation

relation to those that now occupy their attention, or from being humble labellers, or clerks, or other inferior officers, and they have been forthwith entrusted with the highest department of the science, the naming the collections.

1489. *Chairman.*] Are these comments of yours in comparison with what you see in other collections, or what you might wish to see at the British Museum?—Both with what I see in other collections, and with what I would wish and do expect ultimately to take place in the National Museum of England, where we shall one day have our Lamarcks, our Latreilles, our Cuviers, and our Geoffroys.

1490. What other collections do you immediately refer to?—Especially to those in Paris.

1491. Sir *Philip Egerton.*] You stated that your observations were taken during the last month with respect to the names?—During the last four weeks I have examined the condition and the naming of the Zoological collections.

1492. Are you aware in what state the naming of the specimens was six months ago?—I am not able to compare the present state of the naming with the naming of six months ago, from having no notes of its condition at that period.

1493. Are you aware that a vast number of those names have been removed for the purpose of being copied out afresh in more legible characters?—No; I should never allow myself to think that the zoological specimens, recent and fossil, of the British Museum, had been left in their present nameless state to the inspection of the public from such a cause as that.

1494. Mr. *Hawes.*] If the names have been removed in order to be copied out in more legible characters within the last six months, to what should you attribute such activity after so much delay?—I should conceive it a most extraordinary mode of procedure to remove so vast a quantity of names as are now deficient from the specimens, recent and fossil, of the collection, with a view to copy them all, when there were obviously not hands sufficient to copy them in a reasonable time. It appears to me far more reasonable to suppose that if the officers had been anxious to put better and larger labels upon the specimens, they would have taken them away portion by portion, and they would have left the collections generally with some kind of names to satisfy the public and the curious.

1495. In your opinion was it necessary to remove the old and ill-written names before the new ones were ready to replace them with?—I should think such conduct most absurd.

1496. Sir *Philip Egerton.*] But in cases where the old names have been left, you object to the nomenclature?—I believe that the antiquated names to which I object have been amongst the most recently put where they are now placed.

1497. As you mention the antiquated names, your extensive knowledge of zoology will enable you no doubt to take the list of names that has already been submitted to you, and to state one by one the Cuvierian names of those specimens?—The proper generic names for simia satyrus and simia troglodytes are pithecus satyrus and pithecus troglodytes, because these two species come under the genus pithecus.

1498. What is the Cuvierian name?—Cuvier was profound in anatomy and in what relates to fossil animals, but not so strictly systematic in his mode of adopting the scientific names of his fellow labourers; and in the Règne Animal there are generally placed, under the new and improved generic names of modern authors, the antiquated Linnæan names of the species, which might lead a superficial observer to think that Cuvier adopted the antiquated nomenclature of Linnæus: thus, under his genus pithecus he places the Linnæan species simia satyrus and simia troglodytes, which of course are synonymes with him; and they are improper names only when they stand alone, as they do in the British Museum.

1499. Then are the Committee to understand that you object to the Cuvierian nomenclature?—The nomenclature of Baron Cuvier, in the present instance, I would not say is simia satyrus and simia troglodytes, because he has previously distinctly announced that those two species of orangs are placed under a new genus, the genus pithecus, which announcement is not made in the labels of the specimens alluded to in the British Museum.

1500. Your last answer has referred principally to the simias: will you have the goodness to state the Cuvierian names for each of those specimens which are enumerated in the former question?—The simia satyrus and simia troglodytes, for which the proper names are pithecus satyrus and pithecus troglodytes. The lemur volans is the old name for the galeopithecus. The myrmecophaga capensis is the orycteropus capensis, it is not a myrmecophaga; the modern myrmecophaga have

R. E. Grant, M.D.

24 March 1836.

have no teeth whatever, those are American animals; but the orycteropus is an African animal from the Cape of Good Hope, with remarkable molar teeth in both jaws. The ursus meles is the antiquated name for the badger meles; now the term meles is a distinct genus. The canis hyæna is the antiquated name for the hyæna; it is the genus hyæna of modern writers, of which there are several species. The mustela lutra, that is a species of the modern genus lutra, comprehending the different kinds of others. The didelphis pygmæa does not belong to the modern genus didelphis; this alludes to an Australian animal; there are no modern didelphes but in America; this is the petaurus pygmæa of modern authors. The didelphis petaurus is also an antiquated name for a species of the Cuvierian genus petaurus. And I would observe that Cuvier's object in the Règne Animal was obviously to define these and other genera of animals, rather than to furnish the zoologist with a list of species.

1501. Mr. *Hawes.*] What is your opinion as to the nomenclature of the collection of British shells?—The nomenclature adopted in the collection of British shells is altogether antiquated and quite behind the present state of the science of conchology, in so far as the old abolished Linnæan names are applied there to such of the specimens as have yet received any names whatever. I may exemplify this by the fissurellæ, the emarginulæ, and the patellæ of modern writers, which are all placed, in the collection of British shells, under the antiquated Linnæan genus patella. To create greater confusion to the student, however, than that of simply finding the same species of shells in the two adjoining rooms designated by totally different names, we find pencilled from distance to distance, at present, among the British shells, generic names different from those that are written out in the labels annexed to the specimens.

1502. Have you found the reptiles properly classified, named and exhibited?—As in every other part of the collection, the names are still to a very great degree deficient in the collection of reptiles; indeed that collection is in such a state that it can scarcely be said to be either exhibited, classified or named, as it is at present disposed in the British Museum. We find, for example, taking the serpents, that occasionally localities are employed as means of grouping together three or four deep upon the shelves, the nameless specimens of that collection. Sometimes it would appear that the name of the donor is employed to group together collections upon the shelves. Not nearly one-third, I should think, from my calculations of the serpents, have yet received their specific names: frequently they are designated by the locality, as China, Brazil, or other parts; sometimes by the name of the donor; sometimes there is neither the specific nor the generic name, nor the name of the locality, nor the name of the donor. The saurian and chelonian reptiles, both dried and in spirit, are also the most part in a confused and nameless state. I should, therefore, consider that all the specimens of the chelonian, the saurian, and the ophidian reptiles, which are so disposed in the collection, are almost totally useless to the public and to the student; they occupy space which might be much more usefully employed by being occupied by specimens that have their names attached.

1503. Have you turned your attention at all to the dried collection of fishes now exhibited?—There are several very good specimens exhibited of dried fishes, but unfortunately, like most of the other parts of the British Museum, they are still left useless to the student and to the public; they are not named one in 50. For example, there are 150 specimens exhibited on one side of the room; and with an additional small case containing 92 fishes, there are about 242 specimens of dried fishes exhibited now, mounted and disposed along one side of Room XI., and only four of which specimens have the names of species annexed to them; and these four names are written in small characters, and pasted upon the body of the fishes. Not a quarter of the fishes preserved in spirit appear to have their specific names affixed to them, and not nearly a quarter of the Paris collection of fishes are yet within our walls. In Case 24, Room XI., there are 66 specimens of dried fishes, of which two specimens alone have their specific names annexed to them. As I lay so much stress, with reference to the value of a collection, upon the naming of the specimens, it might perhaps be proper to make a remark concerning the value and importance of names attached to zoological specimens. Accustomed to look at collections in this country and abroad, it is one of the first points to which I generally direct my attention, because I know that the most scientific, and consequently the most expensive part of zoological collections, is obtaining the name of the objects; and I know also that the most useful and valuable part of a collection

collection is the obtaining what are termed good names. There are a few specimens of insects, for example, in the British Museum which I consider of great scientific value, because those few specimens have the valuable names of Latreille written with his own hand; and attached to them there are likewise other specimens of insects of great value in the British Museum, from having still the valuable names of Dr. Leach, in his own handwriting, and undisturbed, attached to them. Now, many objects of zoology are scarcely of any appreciable value until they are identified and names are assigned to them by competent authorities. Sometimes an object, say a very rare shell, may not be of the value of one farthing until it is identified by a competent naturalist; and then being properly named, its value may be raised to 30, 40, 50 guineas. Yet it still appears no larger, not more beautiful, not heavier than a specimen which may not have the value of one farthing. A small bird, which appears one of the most insignificant specimens of the Museum, and which would not value 1 *s.* among ignorant collectors, is said to have cost nearly 80 guineas. The proper scientific names of the objects are all-important in zoology, they are the key to the whole history of the species. Again, I conceive that there are good names and there are bad names in zoology: good names are names given by naturalists of the highest eminence in that particular branch of zoology to which the names apply; bad names are names given by ignorant collectors, or persons of no eminence or authority in zoology; and they are seldom to be relied on, especially where the rarity or the characters of the objects present difficulties in their identification. You will often find in provincial and in private collections that common birds, common shells, or insects of the neighbourhood, have their names attached to them, while the more rare and interesting objects of those collections, those most valuable to science but most difficult to identify, are left without their names; that is because of the greater difficulty, and consequently because of the greater expense, which attends the obtaining of the names of the rarer objects. If I might apply these remarks to the British Museum, I would say that you will find in the British Museum a considerable display of specific names, which of course are the only valuable names in science, because there is no genus, or order or class in nature; those are arbitrary and conventional divisions, but the individuals of species are alone presented to us as real existences on this globe; and the names of the species are consequently the only truly valuable names for the zoologist. Now, you will find in the British Museum principally the cheap names, as well as the cheapest objects of zoology. Those are the most generally distributed in the Museum that are most cheaply and easily obtained, as British birds, British insects, and British shells; those common objects, with common names, are lavished in our Museum, while the more difficult and valuable names of rarer objects are left to be sought for hereafter: and so the nameless materials from distant climates accumulate upon our shelves, rather as in a magazine than in a national museum.

1504. Have you made any observations upon the collection of serpents and lizards in spirit?—I have examined so far as a visitor can in the British Museum, without handling the specimens, by inspecting them through the glass cases, and I find that these remarks, regarding the want of names and the want of classification, are applicable to those as to the other departments of the Museum. For example, in Cases 8 and 9 of Room X. there are 130 spirit preparations of serpents, of which about 18 have their specific names affixed to them. In Room IX. there are about 100 specimens of dried lizards and serpents, and among these I can detect but one label, and that label contains only the English name and the locality. The batrachia, like the serpents and the fishes, are for the most part nameless.

1505. Have not you found them crowded two or three deep, or placed so high as to render it impossible for the visitors to read the small manuscript names attached to them?—That crowded and confused state of the specimens is most generally seen in the spirit preparations of the radiata, the mollusca, the fishes, and the serpents; and consequently it often happens that where there are specific names attached to the specimens, the names cannot be reached by the eye of the visitor.

1506. Have you seen a specimen of the vertebral column of a serpent labelled thus, "Vertebra of an Indian Boa"?—I conceive that that question is put to record the fact, that there is that neglect of the specimens in the British Museum which should have left a label of that absurd character, painted in large capitals,

R. E. Grant, M.D.

24 March 1836.

and attached to a specimen suspended from the wall. I have observed that label where 'vertebra' is put in the singular number for the whole vertebral column.

1507. Is there any difference in the classification adopted in the collection of British birds, as compared with the general collection?—Yes, the classifications are different; the classification of Temminck is that which is adopted throughout the greater part of the general collection of birds, but the collection of British birds is arranged according to the classification, I understand, of Mr. Jennings, who has published a recent work upon the British birds; it is not that of Temminck, which is the one followed in the general collection of birds. The difference of the classifications of the same animals in the two adjoining rooms, tends much to confuse the student who has studied the general collection, when he comes to find the objects, for example, the omnivorous species, thrown into a different arrangement in studying the British collection of birds.

1508. Will you describe the state in which you found the collections of recent and extinct cephalopods?—Perhaps of all parts of the collection, that is the one that would most interest the naturalist, the geologist, and even the curious visitor of the Museum, from the myriads of these in our seas and in our strata, and from the multitude of beautiful and extraordinary forms which they present; yet unfortunately for the public, that part of the collection in the British Museum is almost as completely useless as if no such collection existed. The specimens of recent cephalopods that are preserved in spirit are crowded together, bottled up in a small space, often in a turbid state, so that the characters of these interesting objects cannot be seen, and the names are most scantily applied to them. Then with regard to the extinct cephalopods, which constitute by far the most extensive and the most interesting part of this class, although we have hundreds of species in our own country, there is not a single specimen yet exhibited with the other fossils in the British Museum. I have myself been anxious to consult the collection of fossil ammonites, of which there are perhaps half a thousand species known, and I had been informed that there is a fine collection in the British Museum; but upon inquiring first of Mr. Gray, as he is more especially interested in the molluscous animals, whether I might have access to consult the fossil collection of cephalopods, I was referred to the mineralogist, Mr. König: upon inquiring of Mr. König for permission to inspect the collection of fossil cephalopods, I was informed that they were packed up in papers and in boxes, and were not accessible, being stowed, for want of room, in some store place in the lower part of the building. And thus while the most common trash of science are spread in absurd profusion over our available space for exhibition, the higher and more interesting objects of science, the rarer forms, those more difficult and expensive to name, are thrown aside and concealed from public view. The shells of the most common British species of muscles and oysters, clams and cockles, whelks and snails, which may be carted up from our fields, or our ponds, or our coasts, are widely spread by fifties and by hundreds of duplicates, in our fine glazed cases, while there is no space to exhibit a single fossil cephalopod, or fossil bivalve, or fossil coral, in our gallery.

1509. Will you give your opinion to the Committee as to the expediency of arranging the extinct species of shells and other animals along with recent specimens of the same genera, or having them mixed up with the minerals, as they are at present?—I conceive that it is one of the means by which the collections of fossil animals of the British Museum are rendered as little as possible useful to the public, that the mineralogist has his attention distracted from his own very distinct department of inorganic bodies, by zoological specimens of all the extinct species being left to him to name and arrange; and consequently the vast field of the most difficult and perplexing forms which he thus has willingly or unwillingly undertaken to work out, must render it for him to classify, to name and to exhibit, in a proper scientific manner, the collections of objects so numerous, so perplexing, and so totally different from mineral bodies. I conceive that it would be infinitely better to separate altogether the vast department of fossil animals, and to make a distinct collection of those in the British Museum. In Paris there are two collections of fossil animals; the one is stratological, and is connected with the geological specimens in the same apartment, it is not in any way connected with the mineralogical specimens; but there is also in the zoological department, succeeding each genus of the recent species, a series of the most nearly allied fossil forms. After the recent forms of a particular genus, it is quite practicable to arrange in a consecutive series all the known fossil forms of the same genus; that can be done with great ease; for example, where the specimens are small, as in the crustacea and in

the

the molluscous classes of animals; but I think upon the whole it would be infinitely more advantageous to the public and to science, to have an entirely distinct department, and a distinct part of the building appropriated to fossil animals, comprehending the fossil mammalia and fossil reptiles, and all the inferior fossil tribes, which are now far more than sufficient for the exclusive occupation of any one individual.

1510. That is the case at Paris, is it not?—They have a separate collection of fossil animals at Paris, connected with the geological department, and distinct from those collections of fossils which accompany the recent species. We find after the recent species, in many parts of the collection at Paris, as in the mollusca, also the fossil specimens placed in the same order as that followed in the work of Lamarck, who was at the head of this molluscous department at Paris. There are many specimens, however, which from their great magnitude cannot be conveniently placed after the recent species. For instance, the enormous fossil ammonites, sometimes three or more feet in diameter, could not be so conveniently classified and placed with the recent forms of cephalopods. I think, indeed, that most of the fossil animals could be more conveniently and more advantageously placed in a separate department, and under a separate curator.

1511. With reference to the general and British collections of insects, have you any observations to offer?—The eye of the naturalist visiting the British Museum 'never is, but always to be blessed.' The collections of insects, which I have often inspected of late, like the collections of mollusca and other animals, are in a state of progress; and the industrious and worthy curator, Mr. Samouelle, is labouring with great care, as I believe he has been doing for the last 14 years, to bring that collection into a state capable of being usefully consulted by the student of entomology. He has, however, a vast field still to go over, and I hope that his persevering industry will enable him to go through a large portion of it, although I should scarcely anticipate from the materials yet remaining to be worked out, that during his worthy and valuable services, that collection would be brought into a complete state of arrangement and nomenclature. I admire the plan which Mr. Samouelle has adopted of distributing the collections, which were very confined in space in the time of Dr. Leach, over a larger space, and of putting down the names of the species which are defective in the collection, so that the numerous acquisitions of new species which may hereafter be made will not require any new arrangement, or cause the collections that are already arranged to be disturbed. The newly acquired species will merely be inserted in the vacant spaces which are left for their reception. He has proceeded already nearly through the collection of British insects, and through the larger part of the foreign coleopterous insects; he has proceeded also with great care through a large portion of the foreign lepidopterous order of insects; some of the orders of foreign species are not yet touched; for example, the foreign dipterous insects, and the new collections which remain to be incorporated with the old. The same plan is adopted by Mr. König in the small collection of fossil gasteropods exhibited in the gallery, but where the naming is more deficient than in the collections of insects. But I hope that the Trustees will give the necessary aid to bring those and all the other parts of the collections in the British Museum to a state of arrangement and nomenclature fit to be useful to the student and to the public, and gratifying to the naturalist.

1512. Would you apply the same general observation to the collection of crustacea?—The same remarks apply to the class of crustacea; they are still in progress of arrangement and naming, and are far from being completed in the nomenclature or in the arrangement, especially with the numerous perplexing orders of crustacea below the decapods. In Room IX. Case 8, containing the crustacea below the decapods, there are 73 specimens, and of these one only is named. Case 3 contains 46 decapods, of which 11 only are named. The decapods are spread over a considerable space, from the extent of the collection of these large species, but the inferior orders of crustacea have yet to be completed and worked out. The fossil collection of these animals is miserably poor, and consists chiefly of plaster casts of the more interesting forms of trilobites, which abound in our strata.

1513. Is there a collection of extinct quadrupeds in the Museum?—There is an exhibition of plaster casts or stucco work in the British Museum, which almost entirely supplies the place of the real remains of extinct quadrupeds; there is an exhibition consisting solely of plaster work, representing parts, for example, of the deinotherium gigantium, medium and Cuvieri, the rhinoceros minutus, schleiermacheri

R. E. Grant, M.D.

24 March 1836.

macheri and goldfussii, the megatherium, chalicotherium, anthracotherium, anoplotherium, palæotherium, tapirus and sus diluvianus; but not a real fragment is seen of any one of these quadrupeds. More than half of the fragments even of the mastodons, that is 44 out of 74 fragments, are also of the same painted plaster; and although our diluvial caves abound with remains of extinct bears and hyænas, not a fragment is yet to be found in that collection of the remains of those quadrupeds.

1514. What is the state of the collection of extinct zoophytes?—There is not a single species or specimen of any extinct zoophytes yet exhibited, nor even of the most common echinida, in the fossil department of the British Museum. These extensive series of fossil animals, which are so highly interesting to the British geologist, are entirely kept out of view, like the conchifera and the cephalopods.

1515. Are the recent species of zoophytes named generally?—Progress is making with the naming of the small collection of dried specimens of these animals; but in Room IX. Case 13 contains about 120 specimens of radiata in spirit, of which only about 32 have their specific names annexed to them, and there are scarcely a dozen specimens of that interesting and extensive class acalepha exhibited in the British Museum.

1516. Do you know who named those specimens in the collection of British birds?—I have mentioned in a former answer that it is a comparatively easy matter to name the common forms of animals that occur daily around us; it is comparatively easy to name the sparrows, the crows and the common poultry that we see constantly before us, and indeed we find many persons in an inferior grade of life, especially collectors, who make themselves acquainted with the old Linnæan names of shells and insects, and birds more especially; therefore in provincial and in small private collections you will generally observe that those commoner, more easily named, more cheaply named objects, are those which are first and often solely named; and this is the case in a great measure with our indigenous collections in the British Museum. The species in the collection of British birds have been identified and named by a boy, who is employed in the British Museum in the capacity of a copier of labels; that boy has been able, I understand, to identify and to name and label every species of the British collection of birds in the Museum.

1517. Do you mean to say that the authority for the nomenclature in the collection of British birds, rests with a person of that description?—So I understand.

1518. Will you state the grounds of that opinion?—I have seen him at work with his books and specimens. I hope that it will not redound to his injury. I had the statement I have made from his own authority, and I have the authority of Mr. Gray for saying that "he works them out very well;" at least if I may rely upon these words used to me by that officer of the Museum, in speaking of the boy's labours in the identification of the British birds. And although I have been informed that names were previously attached to several of the specimens, I have been informed by that young naturalist, that he has himself identified and labelled every species of British bird exhibited in the collection.

1519. Taking the collection as named by such an individual, you would think it creditable to him?—It is highly creditable to him.

1520. But supposing a national collection named by such an individual, you would not think it creditable to the superior officers of the Museum?—Although it is more easy to name the common British birds and other indigenous animals, than to name the rarer species, for example, of tropical climates, yet I do not think it creditable to a national collection to entrust to an inferior officer the highest departments, which I consider to be the naming of the species: it is an all-important subject, the naming of species in great national zoological collections; the name is much more than half value often of the specimens.

1521. Who names the species in the general collection of birds?—I am given to understand that the specimens in the general collection of birds have been also named by another inferior officer, an industrious young naturalist, a brother of Mr. Gray, who is designated in the Report of the Committee as an assistant and a labeller of the specimens. I will state an example of what I conceive might often occur in an extensive collection of foreign birds, from not having the first authorities to search for the names: There is a bird called the Emu, the dromiceius Novæ Hollandiæ; that bird in the British Museum comes under this extraordinary designation: first, we have the generic name in English, "Emu," which is

R. E. Grant, M.D.

24 March 1836.

the common name of the New Holland bird; beneath this English term "Emu" there is a generic Latin name "Rhea," which is properly the name of an American bird. Under these generic names of emu, rhea, there comes another generic name of "Casuarius," and Novæ Hollandiæ for the name of the species. Under what designation, therefore, is the student to understand that that Australian bird is placed; is it a species of "Rhea," or is it a species of "Casuarius," or is it in fact the dromiceius of New Holland? The casuarius is an Asiatic bird, the cassowary, and is designated in the British Museum as a "Strutheo," which is the name of the African ostrich; the rhea is the American ostrich, and the dromiceius is the emu of New Holland. This confusion of nomenclature is especially to be avoided in the naming of public collections, where the students and the public often rely for their whole instruction in zoology.

1522. To whom do you think that the public look as the responsible person for the nomenclature adopted?—In the Paris Museum, where the zoological departments are distinct, I should at once understand who the public were to look to for the designations put upon the different classes of animals; but in a museum constituted in so confused a manner as the British Museum, where every one is subordinate to the other, and all have to do with everything, it is rather difficult to say who has to do with the naming of the birds. Dr. Leach named the general collection of birds; but his "new-fangled names," it seems, gave offence to the mineralogist, Mr. König, who removed Dr. Leach's names, and put other names to the specimens, in some four different languages, in place of those names which Dr. Leach had assigned. I mean to say that it is printed in your Report, that Mr. König wrote the names of the birds, in some four languages, and annexed these labels to the specimens. The Committee have it upon evidence that Mr. Samouelle also named the same collection of birds. Mr. Gray has devoted his attention to the naming of the birds. Mr. Children states, that he is responsible for the naming of the birds. Mr. George Gray, at present employed in the humble capacity of a labeller and assistant, is employed in naming the general collection of birds; and I understand that as soon as the young gentleman at present employed in naming the British birds, has finished that part, he will proceed to assist in naming the general collection of birds. So that it is difficult to say who is responsible for the names attached to the general collection of birds in the British Museum.

1523. Do you think that the zoological collection of the British Museum is to be compared with that in the Jardin des Plantes, either in regard to extent or value, or utility?—I think that in most parts a comparison between the collections exhibited in the British Museum and those exhibited in the Museum of the Garden of Plants would be almost ludicrous. In the Garden of Plants all the collections are extensive, well preserved, well exhibited, classified, and named by the first authorities in Europe; they have been increasing for more than a century; they are supported by large annual grants from Government, and they are directed and superintended by many of the most eminent zoologists living, who have each their particular departments, with numerous assistants under them. There are in the Paris Museum numerous specimens of elephants, eight skeletons and eight mounted specimens of rhinoceros, numerous hippopotami, camels, dromedaries, giraffes, seven tapirs, seals, lions, tigers, and all the more interesting forms of quadrupeds, with 15 or 20 specimens of the cetaceous animals of this class. Their collections of the largest terrestrial and aquatic mammalia are of such ponderous weight that it has been found necessary, for the safety of the building, to bring them down from the quadruped apartments above, and collect those majestic forms in the lowest part of the Museum. The Zoological department of the British Museum is miserable in funds, miserable in science, miserable in materials, and its collections are for the most part without either classification or nomenclature; so that the Museum more resembles a store-house than a school of zoology. In the place of those majestic mammalia of the Paris Museum, we have in the British Museum some stuffed skins that once resembled the giraffe; but where now, in the hideous rents that extend along the carcase, we see the straw and the beams of wood visible through the wide openings of the bleached, disfigured and torn hides, where all the original characters and forms and colours are gone; their naked and blistered hide has been exposed for many a long year to dust and insects, without the least protection. They have served their time of usefulness long since, and their zoological characters are completely gone; that slender tapering nose that once was straight, is now twisted to the left, and the soft smooth skin that once

R. E. Grant, M.D.

24 March 1836.

was covered with beautiful spots, melting into a light and pleasing ground, is now a hard, naked, blistered, tanned and uniform surface; the cords with which the skin had been stretched have long since torn that skin by its contraction into rents. Those slender limbs, once graceful in their proportions as in their movements, are now distorted pillars stretched asunder like a pyramid to support the rotten fabric. Our lama's mouth is of painted plaster, which happily has withstood the ravages of the insects which have so often swarmed upon its hide; and the naked and decayed hide of our coudou antelope, placed in the staircase, gives early warning of the state of our collections within, where our best specimens are disposed along the tops of our cases, alike exposed to dust and insects as those without. And those are our substitutes for the magnificent and beautiful specimens exhibited in the Paris collection. The chief constituents of our collection of the class mammalia, in the British Museum, are mice and rats, shrews and moles, squirrels and rabbits, hares and cats. Now it is often amusing, if not instructive, to observe, in an extensive flock of the same kind of animals, how much the external markings of the fur, or of some equally trivial characters, are liable to vary, and also how the most common of all common animals vary their hues in each particular part of the globe; but it is quite another thing to accumulate the very trash of science, where a collection is so destitute of the more interesting specimens. While there is not space in our cases to protect the few interesting mammalia in the possession of the British Museum, would the intelligent visitor expect to find the limited space available for exhibition filled with 20 cats placed together, 25 mice, about as many rats, nearly 50 squirrels, 20 specimens of hares and rabbits, placed, as if to prevent the public from seeing that there were so many of the same objects, in different parts of the collection; and this, while we have neither elephant nor rhinoceros, camel nor dromedary, lion nor tiger, walrus nor dolphin. In most other departments of the zoological collection, the British Museum as little stands a comparison with that of the Garden of Plants at Paris. In the British Museum we have seven skeletons of vertebrated animals; and in the Paris collection there are more than 2,600 entire skeletons of vertebrata. In the collection of birds also, we do not find in the British Museum, as in Paris, the more rare and interesting species prevailing in the general collection, such as those of tropical climates. The collection of humming-birds is poor compared with that of Paris; it is poor compared even with those of some private collectors in this neighbourhood, as that of Mr. Loddige, of Hackney, or that of Mr. Leadbeater, of this city. The collections of hornbills, of strutheous birds, of toucans, and of birds of Paradise, are poor compared with those of Paris. As the dentist has restored our skeleton of the elephant by thrusting teeth not his own into its jaws, so the painter, with alternate daubs of red-lead and lamp-black, has with equal skill restored the deep crimson and cerulean hues which once decorated the neck of our cassowary in some island of the Indian Ocean. In the estimation of those who have examined most narrowly and with great practical skill the principle museums of Europe, the British Museum stands, in regard to birds, which indeed form its principal contents, the sixth, or nearly equal to the fifth, European collection; the first being that of Leyden, the second that of Paris, the third that of Berlin, the fourth that of Vienna, the fifth that of Frankfort on the Main, and sixth, the British Museum collection of birds. The collections of molluscous animals at Paris were named by Lamarck, and by his assistant, Du Fresne; they are exhibited in the most satisfactory manner, with regard to everything that relates to the instruction to be derived from contemplating such objects; the specimens and classifications perfect, and the names given by the first authorities. In the collections of articulated animals in the Paris Museum, the names were assigned to those animals by Latreille, the first entomologist of Europe, and every species was named by that distinguished naturalist. Even the mode of exhibiting, independent of the great scientific value which all who are conversant with those subjects must attach to the typical species and the nomenclature of such men, even the mode of exhibiting the classes is such as to afford a most instructive and beautiful display of the articulated classes of animals in Paris. You have not a single specimen of a myriapod exhibited with the insects and crustacea in the cases of the British Museum; not a single specimen of the class arachnida. In the Paris collection those classes are exhibited in great numbers; and the mode of exhibiting to the public the extensive collections of insects in the Paris Museum shows the contrast of the two, when you compare it with that of the British collection. Look, for example, at the extensive, beautiful and instructive display of the lepidopterous order of insects

insects in the Paris Museum: you have the skins of the larvæ dried and preserving all their natural characters; even the ova of the insects are exhibited, and wax models, beautifully imitated, are also given of the larva state of these insects. The chrysales are also put in many parts of the collection along with the full-grown specimens; so that the whole history of the metamorphosis of many insects is exhibited by the specimens, as they are shown in the Paris collection. The same is the case with the mollusca: you have, along with the shells, the scientific names given, and either specimens of the animal inhabitant in spirit, or beautiful coloured wax representations of the animal as it were creeping upon the surface of the ground. A few examples, in imitation of the Paris plan, have been introduced, I observe, into the British Museum, but very few, and none as yet applied to the elucidation of the articulated classes of animals. The radiated classes of animals in the Paris collection were named by the first zoophytologist in Europe, Lamarck; the specimens are splendid, the species most extensive, and the numbers that are annually added are so great as to have been actually mistaken by one of the officers of the British Museum for the total amount of the collections of these animals preserved in the Museum at Paris, as stated in your last year's Report, page 239, question 3336, where the increase of mollusca and radiata in one year at Paris, is mistaken for the total amount of the collections. The fossil forms, as well as the recent, are extensive, classified and named, at Paris; while in the British Museum they are generally poor, for the most part nameless, often concealed from public view, or have their place substituted by a plaster exhibition of stucco work, as in the fossil crustacea and the fossil mammalia.

1524. Then, in every point of view, the zoological collection in the British Museum is inferior to that of the collection at Paris?—In a scientific point of view, there can be no comparison between them; it is infinitely inferior in every point of view to the collection at Paris.

1525. Have you at all had your attention drawn to the fossil reptiles in the Museum, known as the saurian remains once in the possession of Mr. Hawkins?—That part of the collection, as I had occasion to mention before, is excepted in my remarks concerning the inferiority and imperfect state of the zoological collections of the British Museum. Those specimens of fossil sauria, I conceive constitute a collection of themselves, which are calculated to raise the character of the British Museum. The specimens which have been dissected by the scientific chisel of Mr. Hawkins, are the Elgin marbles of fossil zoology; they show an extent of knowledge equalled only by the skill and perseverance of their author, and are stamped with a value which no other specimens approach. I would here mention particular examples with the more good-will, because of the remarks which I have heard applied to these invaluable specimens, which we owe to the industry and skill of Mr. Hawkins. Look at the large specimen of the plesiosaurus dolichodeirus, and contrast the little instruction to be derived from any part of that large and rudely excavated specimen with the splendid specimens of ichthyosaurus which have been chiselled out of the rock by Mr. Hawkins, where every bone projects in relief to such an extent that you might almost lift it from the rock; you see each bone entire in all its parts, its processes, and its depressions and foramina, displayed with equal truth and art. But generally the bones of other fossil sauria are chiselled without knowledge, exhibited most indistinctly, or broken to pieces, in the specimens which have not been dissected from the rock by that gentleman. Altogether the specimens, viewed as a whole, which have been obtained from Mr. Hawkins, perhaps have not their equal in any other collection in Europe.

1526. Have you ever heard of the existence of any catalogue, either in manuscript or in print, of any part of the zoological collection of the British Museum?—The catalogues of the different Zoological departments, from my own observations, I would say appear to be in progress, like the arrangement and classifying of the objects themselves. I have seen only small parts of catalogues which are being constructed, of the serpents, part of the catalogues of the crustacea and insects, small parts of catalogues which are in progress of the mammalia, and some notes respecting a few of the fishes.

1527. What is your opinion of the plan adopted in forming those catalogues?—They appear to me in so imperfect a state yet, that I would scarcely venture to offer an opinion regarding the plan which may be ultimately followed in the entire arrangement of those catalogues; but so far as I observe the manner in which the parts are at present being constructed, they are capable of being arranged in

R. E Grant, M.D.
24 March 1836.

future in whatever manner the officers may deem most expedient; the descriptions relating to the separate species of animals being upon separate leaves, those leaves can be detached and arranged in whatever order or manner shall hereafter be deemed best, according to the future state of the collections.

1528. Do you consider the proposition of establishing courses of lectures by the officers of the Museum, as expedient or useful?—I think that the adoption of the plan which has so long proved advantageous in Paris, of making the Museum of Natural History also a school of Natural History, might prove equally useful and expedient in England, if it were not too scientific and expensive to be decently supported by our Government, and if the heads of the different Zoological departments were constituted here as the heads of the different departments in the Paris Museum. I conceive that it would give the public an additional interest in the collections, and would render them infinitely more valuable and useful to the nation.

1529. Do you think that the deplorable condition in which you have found the zoological collections of the British Museum, with regard to all the useful purposes of such collections, is to be ascribed to the neglect or the want of competent knowledge on the part of the Trustees who have undertaken to direct the affairs of the Museum, or to any incompetency of the inferior officers for the duties they were appointed to perform?—I conceive the deplorable state in which I have found the different collections in the British Museum to be in a great measure dependent upon the bad constitution of the whole establishment, the long continued neglect of the Zoological department, the mode of appointing officers, and the want of proper attention and skill on the part of the Trustees, whose duty I think it was to inspect the different collections, and to see that they were kept in a condition fit to be useful to the public and to the man of science.

1530. Sir *Robert Inglis*.] Without pursuing at this late hour the inquiries to which those who do not concur with you in the greater part of your answers might wish to call your attention, you are requested only to answer one general question, the answer to which will supersede the necessity of any other question upon the point. In your answer 315 to a question, in which an extract from a paper written by the late Sir Humphrey Davy, published by Doctor Davy, is quoted, the following words occur: "I should say that I believe corruption generally enters first, and reform last, into scientific institutions; and there is perhaps no institution in the British dominions where a thorough reform would be more beneficial to the public and to science, than the British Museum." As the point at issue in the extract was the British Museum, and as in the first clause in that answer, in which you refer to corruption, you did not exclude the British Museum, though in the extract no such phrase occurs, you are requested to state whether you desire to withdraw that charge; or if not, on what authority you made it, giving the instances, the names, facts and dates, in which you sustain your implied charge of corruption against the administration of the British Museum?—The corruption that is spoken of there is not applied in my remarks to the constitution of the British Museum, but it is a general sentiment which I believe to be true, as I did when I spoke it.

1531. The question refers not to the constitution of the Museum, but to the administration of the Museum?—The second part of the answer, which refers especially to the British Museum, I see no grounds for altering; which states that I consider that a reform would be highly advantageous in the constitution and management of the British Museum.

1532. Your attention is again recalled not to the second clause of the answer, but to the first, in which you state, not excluding the British Museum, (and as the question referred to the British Museum, it may be supposed that you include it,) that corruption generally enters the first, and reform last, into scientific institutions; and the question is, whether you withdraw the implied charge of corruption which is to be found in that answer, or whether you sustain it. If you withdraw it, you will state so in a word; and if you desire to sustain it, you will specify the names, facts and dates, in which such corruption, in your judgment, has existed?—I answer again, that the first part of my remark is a general sentiment, which I believe to be true.

1533. Then you do not mean to apply it to the British Museum?—If I shall ever find it expedient to apply it to the British Museum, I shall do it; but not having done it, I shall not be forced to make that remark.

1534. By the term "not being forced to make that remark," do you wish the

Committee

Committee to understand that there are any circumstances within your knowledge which at some future period you may think it expedient to bring before them as evidence of corruption in the administration?—No, certainly not. I do not, and did not charge the administration of the British Museum with corruption, but only insisted that there are such bad arrangements, such defects in the constitution, that, as I have stated in the last part of my answer, a reform would be highly advantageous in that establishment. *R. E. Grant*, M.D. 24 March 1836.

1535. *Chairman.*] Have you the management or arrangement of any collection?—I have the management of the collection illustrative of my own lectures in the University of London.

1536. But you have no large collection?—It is rapidly increasing.

1537. Have you ever tried to make out a catalogue of a zoological collection?—Only of my own materials.

1538. But of no very extended nature?—They will extend with time.

Mr. *Richard Owen*, called in; and further Examined.

1539 Mr. *Hawes.*] HAVE you brought a list of leading authors who have written works more especially upon zoology, which are not to be found in the library of the British Museum?—I have brought a list containing such works. Mr. *Richard Owen.*

[*The Witness delivered in the same.*]

1540. Sir *Robert Inglis.*] In your answer 1179, you stated that you have a long list of such works, which you will forward to the Committee; is the list which you have now delivered in, the list to which in that answer you referred?—It is a part of that list, not the whole.

1541. Are the other works in that list which you have at home, works which you have sought in vain in the British Museum; or have you found, upon further inquiry, that the other works contained in that list were works which you might seek not in vain in the Museum?—Exactly so.

1542. You found then that your list had been compiled without a sufficient examination of the contents of the Museum?—Not so, but works which I had formerly not found in the British Museum have been subsequently added to the Zoological department of the collection.

1543. The whole of the works to which you called the attention of the Committee in your former examination, being works which have been printed almost exclusively upon the Continent within the last 12 years?—Yes, a great proportion of them.

1544. Has the supply of the works to which you refer been made within the last six months, or at any period which you can specify?—Within one or two years.

1545. There has been, then, an increased attention to the supply of the current works of zoology, in the course of the preceding two or three years?—Undoubtedly there has, but not to that extent as to raise the Zoological department of the library to the comparative state of excellence in which it was left by Sir Joseph Banks.

1546. You still feel that that department is not so perfect as it was when Sir Joseph Banks's library was made over to the British Museum, reference being had to the state of literature and of science at both periods?—*Cæteris paribus*, I should say not.

1547. Sir Joseph Banks's library being a library almost exclusively of natural history?—Yes.

1548. Mr. *Hawes.*] The works, the list of which you have delivered in, are what you consider essential in the formation of a library professing to be a national one?—I do; they are works of which the corresponding works are in the different sections of Dryander's catalogue of the Banksian Library, consisting principally of monographs, which are the most difficult to be procured for private libraries.

1549. And the fact that they are principally works of foreign authors, does not in your opinion furnish any reason for their not being in the library of the British Museum?—On the contrary.

1550. Sir *Robert Inglis.*] But they are works which you characterize as monographs, and not general treatises?—The greater part are monographs.

1551. *Chairman.*] Are they books that could be acquired without any great difficulty?—

Mr. *Richard Owen.*
24 March 1836.

difficulty?—I am not aware of the exact amount of difficulty, but I think the greater part of them might be acquired, particularly if a system were established of having foreign works on zoology transmitted to our National Library as soon as they were published.

1552. Mr. *Hawes.*] If there were a good class catalogue, would the public be aware of the poverty of the Museum in this particular branch?—Undoubtedly.

1553. Sir *Robert Inglis.*] There appear in this list to be certain erasures, beginning with four works of Cuvier's, and several others. Have you any objection to state whether, when the list was first formed, you had supposed that the books in question were not in the Museum, and that upon subsequent revision even of this revised list, you found that the works were in the Museum?—That is the case with a few, but not with all. I had attempted to arrange my list according to the sections in Dryander's catalogue, but I found that that took up so much time, and swelled the space by the introduction of so many heads of sections, that I was obliged to have my partly classed list re-copied into the alphabetical form, to bring before the Committee to-day, and in that way some mistakes occurred on the part of the copying clerk; thus the works of Cuvier were included, which are well known to be in the British Museum, and accordingly they are erased in my list.

1554. Mr. *Hawes.*] The few works you have erased bear a small proportion to the list given in?—Very small.

1555. Sir *Robert Inglis.*] About 50?—There are 48.

1556. Mr. *Hawes.*] How many authors' works have you enumerated in the list?—The list contains 377 works, exclusive of the erasures. I beg leave to mention that there is one work which I believed not to have been in the library, but which I have found, since my last examination, is there. In referring to the catalogue of the printed books, which affords the information what works are in the library and what are not, I looked for Pander and D'Alton's work on Skeletons, under the head of Pander, and not finding it there, I then looked for it under the name of Alton; and having found De Blainville and De Lamarck entered under the heads of B and L, I looked for the second author's name under A, and not finding it there, I concluded the work was not in the library; but upon subsequent examination I find that it is, being entered in the catalogue under the second author's name only, and D'Alton being arranged under the letter D.

Jovis, 14° die Aprilis, 1836.

MEMBERS PRESENT.

Mr. Ridley Colborne.	Mr. Thornley.
Mr. Hawes.	Sir Philip Egerton.
Sir Robert Inglis.	Mr. Bingham Baring.
Lord Stanley.	Mr. Marshall.

MR. RIDLEY COLBORNE, IN THE CHAIR.

Mr. *John Turner*, called in; and Examined.

Mr. *John Turner.*
14 April 1836.

1557. Lord *Stanley.*] YOU have for some time turned your attention to objects of natural history?—Yes; as a dealer in them, about 15 years.

1558. What do you include in the articles in which you have dealt?—Principally shells, birds, fossils, insects, and occasionally in minerals.

1559. In the course of your professional pursuits, have you visited most of the principal museums and collections on the Continent?—Most of them; and I know well the collections of Paris, Ghent, Leyden, and other Continental towns.

1560. Are you acquainted with the Frankfort collection?—No, I have not seen it lately.

1561. You are lately returned from Paris?—I left Paris on Saturday morning last.

1562. Have you been examining the collection of shells at Paris?—I was called to look over them on business. I had some transactions with the officers of the French Museum, respecting some specimens of natural history, and M. Valencienne, the principal of that department, offered me in exchange such duplicates as they had upon their tables; I went over their collection of shells, which I had frequently done before, and selected such duplicates as I thought would answer my purpose.

1563. Have you examined the collections of shells, not as a mere casual observer, but very minutely?—I have a very intimate knowledge of the collection

in

Mr. *John Turner.*

14 April 1836.

in the museum of Paris, not only by having seen it last week, but by having seen it repeatedly; seldom six months elapse between my visits to Paris, and upon all occasions I look at their shells, and ask what additions they have made since my last visit.

1564. You are also well acquainted with the collection of shells in the British Museum?—Very well.

1565. How long have you known the collection in the British Museum?—From my infancy; but I have known it more particularly since I have made it my business to deal in objects of natural history; I have known it intimately the last 12 or 14 years.

1566. Carrying your recollection back to the 12 or 14 years during which you have known it, what was the state of the collection when you first knew it, and what has been the progress made in the collection during those 12 or 14 years?—I think I can date the progress to about six or eight years past. The first six or seven years it was nearly stationary; the last six or seven years I have traced a very rapid improvement in the collections.

1567. Has the improvement in that time been very rapid?—It has been more rapid than in any museum I am acquainted with; it has become a respectable museum; a museum of first-rate importance; and 10 or 12 years since it was a disgrace certainly to the country.

1568. Comparing the progress which has been made in the collection of the British Museum and in the Paris collection, which has made the most rapid progress within the period during which you have known them both?—The improvement in the collection of the Paris Museum has been slow in comparison to the progress which has been made in the collection of the British Museum.

1569. Mr. *Hawes.*] You are confining your observation to shells?—Yes; but great improvement has been made in the other parts also.

1570. Lord *Stanley.*] With regard to the actual scientific value, or the mercantile value, of each of the two collections, how should you rate it?—The scientific value, and the value in pounds, shillings and pence, are the same; because it is only so long as specimens are rare, that they produce great prices; so that in a commercial point of view, and in a scientific point of view, I think the value of large collections is the same. It is determined by the rarity of the articles; when articles are no longer rare, they become of little value; but in a commercial point of view, if the two collections were offered for sale, I should choose the British one, as I am convinced that the collection of shells in the British Museum would produce a greater sum of money than those in the Paris Museum. I speak advisedly; I speak as a dealer having a knowledge of all the shells in both collections. The last time I was in Paris I took more particular notice than I ever did before, though I was not aware at the time that I should have to come here; nor was it till yesterday afternoon that I had an intimation of it; but knowing there was a Committee of this kind sitting, I thought that I would look more closely into the collection of shells, and I had a very good opportunity, as I had to go over all the tables separately to look out the duplicates, and I am fully of opinion that the collection of shells in the British Museum is of greater value than in the museum of Paris; I am speaking now of the shells only.

1571. Can you state what the number of shells is in the collection in Paris at present?—No; but by seeing many collections I can give a rough guess. It may be nearly 4,000 species; it may be 500 or 600 more or less.

1572. You speak roughly on that subject?—Yes; within I think 200 or 300.

1573. Mr. *Hawes.*] Do you speak of species or of specimens?—I speak of species, not specimens. Sometimes they have very long suites of the same species.

1574. Lord *Stanley.*] In point of number what would you consider the comparative numbers of the British collection and of the Paris collection?—They have of many shells much longer suites than we have.

1575. Comparing the two collections numerically?—The Paris has the advantage.

1576. Do you consider that the smaller number of shells in the British Museum have a greater scientific value than the larger collection of shells in the Paris Museum?—I think so; there are many shells in the British Museum, which if they were removed from the tables, and I had an order to replace them, and a twelvemonth was given me to do so, without any regard to price, there are 20 or 30 shells which I would not undertake to supply. I could not get them. In other

Mr. *John Turner.*

14 April 1836.

other words, there are more unique specimens in the British Museum than in the museum of Paris.

1577. It has been stated by a witness before this Committee, that "in the British Museum you will find principally the cheap names as well as the cheapest objects of zoology. Those are the most generally distributed in the Museum which are most easily and cheaply obtained, as British birds, British insects, and British shells; those common objects with common names are lavished in our Museum, while the more difficult and valuable names of rarer objects are left to be sought for hereafter." Is that statement consistent with your views, bearing in mind the comparison between the British Museum and the collection at Paris?—Certainly not, in any point.

1578. Having minutely examined the two collections, and being a dealer in shells, are you of opinion that the converse is rather the fact?—I differ entirely from the opinion just referred to; as far as regards the names, I believe there are many names yet wanting; but as far as regards the cheap shells which are spoken of as covering the tables, the converse is the case, because there are many cheap shells that they at present want, and they could be easily supplied.

1579. Therefore at any time hereafter it would be comparatively easy to supply the deficiencies in the British Museum as compared with the deficiencies which exist in the Paris collection?—Yes, certainly.

1580. Are you acquainted with any other collection besides that of Paris, with which you can institute a comparison with the British Museum?—No; except Leyden, in Holland; the collection of Leyden is nearly equal to that of Paris, not in number, but in the variety of the objects; the collection of Leyden contains some extraordinary specimens of natural history, more especially in the way of shells. That collection is not so large, but it is a more choice collection than either the collection of Paris or of London. It is by their being richer in the specimens the produce of Japan; the Dutch having had intercourse with Japan that we have not.

1581. Do you know the comparative progress made in the collection of Leyden, and the collection in the British Museum?—I am not able to speak of that, not having been at Leyden the last two years. They were making rapid progress with the museum when I was there last, but it is of very recent formation, having been established only 15 or 16 years.

1582. You have examined the classification of the shells in the British Museum?—I have.

1583. Do you consider that a scientific and satisfactory classification?—I think so, as far as the general arrangement goes. All the species are arranged in genera, and the families are well put together, so that you have no difficulty in tracing them out.

1584. The collection is satisfactory in point of arrangement to the scientific man, and the whole collection is open to the inspection generally of ordinary visitors?—Yes; I believe there are fewer shells kept back in the British Museum than in any I know of. In the Paris Museum, they have had shells that I have sold them in the professor's room for upwards of two years, and they were not placed on the table till the last few months.

1585. Mr. *Hawes.*] You have had your attention called to the opinion given by Dr. Grant as to the scientific value of the collection of shells in the British Museum?—I was not aware that it was Dr. Grant's evidence; I spoke of their commercial value. I think the commercial value and the scientific value of a large collection is nearly one and the same if they are not overloaded with duplicates, as you might add much to the mercantile value of the collection, and at the same time add but little to the scientific value, if you have a large number of duplicates.

1586. You think that as to the scientific and the mercantile value of a general collection of shells, the one is nearly resolvable into the other?—Yes, of a large collection, when you have no other duplicates than those which serve to illustrate the growth and variations of the shell.

1587. You have been asked whether you think the collection satisfactory; do you feel yourself capable, as a dealer, of deciding that question?—Yes; I do not know any great deal of the science but by dealing a long time in them; I have a general knowledge of shells, so far as the classification goes; of the anatomy of them and of the animals I know but little. I believe I have a general knowledge of the Linnæan and Lamarckian systems, as far as the classification goes; and I think

think that the arrangement, to the scientific man, may be more satisfactory now than to the public at large; the general arrangement is very good, but not complete. I think that, as far as the great divisions go, they are correct. There may be some alterations wanted in the subdivisions which I am not able to speak of, not having looked at it closely.

1588. You have visited the Museum very lately?—I saw it yesterday.

1589. Before yesterday had you visited it recently?—I think four weeks since.

1590. Are you in the habit of frequenting it much?—Seldom a month passes without my being there.

1591. Have you sold many specimens to the Museum?—No, very few indeed.

1592. Have you offered many for sale to the Museum?—No, I have never offered any but what have been purchased.

1593. When you have so made an offer, to whom do you apply?—I have sent my things up some days previous with a bill made out to the Trustees on approval, and they have gone to Mr. Gray's room. I know they came before the Trustees, but through what channel I am not capable of saying.

1594. Have you had frequent communication lately with Mr. Gray?—No; I think I have seen Mr. Gray but twice for five or six months.

1595. You saw him yesterday?—Yes; I was the bearer of a message from Paris to Mr. Gray.

1596. You have stated that the mercantile value and the scientific value of a collection may be resolved into one; may not there be a collection valuable for its completeness in all its parts, although its mercantile value to a dealer may not be very great?—In a large collection, I do not see how that can be.

1597. May not the commonest specimens of British shells be so arranged as to be very valuable to a student, though they may not be very valuable to a dealer?—I think not. I have known instances of a collection of British shells being worth more than a foreign collection of the same size; I have known a collection of British shells, without duplicates, for which 100*l.* has been given by a dealer.

1598. May not there be a value apart from the mercantile value, by reason of the arrangement, the classification and the naming, constituting, in point of fact, the value to a student?—I do not see it.

1599. Are you capable of stating to the Committee whether you think the collection of shells in the British Museum is so arranged and so named as to be in the most valuable condition for the purposes of study?—I do not think the collection of shells in the British Museum is by any means complete, for I think much more might be done; but it is so with all other collections. It is so with the Paris collections. From the rapid increase of the specimens in the British Museum, I am convinced that it must be very difficult to keep it in such a state as would be desirable. If the collection was complete, it would be a very easy thing to complete the arrangement of it; but while additions are continually being made, it must be attended with difficulty. The same remark was made by M. Valencienne in Paris, that the additions made to it rendered it difficult to keep it in a state that was desirable.

1600. In which museum are the classes most perfect?—They are re-arranging the Paris collection at present. Before they were disarranged in Paris, they were more complete than in the British Museum; but there is a disarrangement at present to enable their professor to re-arrange them.

1601. With reference to the time when the Paris collection was arranged and set out, in which collection were the classes most complete?—In the Paris Museum; that was in a comparative complete arrangement about 18 months since.

1602. You have spoken of the re-arranging of the Paris collection; under whose direction is that going on?—M. Valencienne.

1603. Who assists him?—A young man of the name of Rosseau.

1604. Are they men distinguished in that branch of science?—I believe M. Valencienne is not so capable of taking the charge of that division as M. Lamarck or Mr. Blainville, whom he succeeded. His knowledge is principally confined to ichthyology.

1605. The Leyden collection you say is a very fine collection, and you attribute that to the collection having been increased by their communication with the Eastern islands?—Yes, Japan and Java principally.

1606. Sir *Robert Inglis.*] With Japan the Dutch alone have any communication?—Yes, no other European power has any communication with it. I have been in company with M. Siebold, the gentleman who travelled there under the orders of the Dutch Government for the purpose of adding to the collection.

Mr. *John Turner.*

14 April 1836.

1607. Mr. *Hawes.*] You said that the classification of the shells in the British Museum was good, as far as the arrangement goes?—I think the general arrangement good. There have been so many new genera discovered lately that it is very difficult to keep them always in order; but I think that most of the genera which Mr. Gray thinks good have been adopted in the collection.

1608. Supposing an eminent naturalist, such as Dr. Grant, should have given a contrary opinion, should you be disposed to doubt the correctness of that opinion in a scientific point of view?—I should in a mercantile point of view, and it is not consistent with my observations on that collection.

1609. Sir *Robert Inglis.*] And you regard the scientific value and the mercantile value as convertible terms?—Yes, in large collections, only removing the duplicates. I hope I shall not be considered as speaking with any ill feeling towards the Paris Museum; I have every reason to speak with respect of it; I have had large transactions with them, and I have met with the most liberal treatment at their hands. I think the whole of my transactions with the British Museum may be 20 *l.* or 30 *l.* since I commenced business; but with the Paris Museum, during the last 12 months, I have had more than 100 *l.*; and I have felt very much pleased in looking over the tables of the Paris Museum, and seeing that there are many fine specimens which I have passed to them; so that I hope it may not be supposed that I speak at all from a pique against the French Museum.

1610. *Chairman.*] Speaking generally of the British Museum, would you say that the shells are well named and sorted scientifically?—Compared with other collections, I should say yes.

1611. When you offer any articles to the British Museum, is it from a knowledge that you have that those specimens happen to be wanting?—I know nearly all the specimens that the British Museum have, and I know all that the Paris Museum have, and three or four times in my life I have sent things to be laid before the Trustees of the Britith Museum. I do not think the transactions I have had with the British Museum are more than six in number, and each time they have purchased all I sent them.

1612. Have you ever found any reluctance on their part to deal with you?—None.

1613. Lord *Stanley.*] If you happened to come into possession of some very rare specimens of shells which you knew were wanting there, you would offer them to the Trustees of the British Museum as readily as to any other persons, and with the expectation of their giving you the full price?—I should say so, because they have always purchased all that I have offered them.

1614. Mr. *Hawes.*] You said that the British Museum contains more unique specimens than the Paris collection does?—Yes; and I think the unique specimens are those that render a collection valuable in a scientific point of view.

1615. Have not you stated that many fine specimens have passed from your hands to the Paris collection?—Yes.

1616. Did you make any communication to the officers of the British Museum of the possession of the finer specimens?—I did not say that the fine shells I sent to Paris are finer than those they have in the British Museum.

1617. *Chairman.*] Were the specimens you sold to the Paris Museum specimens that you knew the British Museum possessed?—I cannot say so much as that; it has so happened that I have been going to Paris, and I have had occasion to send to them, and I may have sent things that the British Museum would have been glad of, but having larger transactions with the Museum at Paris, I sent them there, and then made one transaction of the whole.

1618. Lord *Stanley.*] A member of the Committee has called your attention to Dr. Grant as a great authority; do you know whether he has a very distinguished name as a conchologist?—I never heard of him before as a conchologist.

1619. Did you ever sell any shells to him, or hear of any person that sold any shells to him?—No; I think three or four years ago he bought three or four corals of me.

1620. Therefore, though he may be a very good zoologist in the branches to which he has applied himself, you would not look upon his authority as very high in reference to conchology?—No; nor do I think any one else would do that has any knowledge of conchology.

1621. Having a pretty general acquaintance with the principal collections of Europe, you do not know any one that is superior to the collection in the British Museum?—Not at this moment.

1622. *Chairman.*]

1622. *Chairman.*] Did you know the collection of the late Earl of Tankerville?—I did.

1623. Were there not some most valuable and beautiful specimens in that?—There were.

1624. Do you know whether any of those went into the possession of the British Museum?—They did.

1625. Some of the finest?—Some of the finest.

1626. Was that collection sold by public auction, or in what way?—There were two modes of disposing of that collection adopted. First, there was a printed catalogue made, and they were offered as a whole; they were exhibited for three or four months, each shell numbered. A catalogue was deposited in the room, with the price of each shell affixed; but there was an agreement, that although you became a purchaser, the shells were not to be removed till the expiration of the three or four months during which they were on view.

1627. Lord *Stanley.*] Are you acquainted with the principal dealers in shells?—Most of them, both in England and on the Continent.

1628. Do you know Mr. Cumings?—Yes, I know him as a dealer in shells.

1629. Have you had any dealings with him?—Yes, when he commenced business in shells.

1630. He is not to be considered as a gentleman that collects shells for his own amusement?—No; a dealer to all intents and purposes, and spoken of as a dealer in shells.

1631. And of course, in disposing of a collection of shells, Mr. Cumings would look to the best market he could find?—Yes.

1632. Are you also acquainted with the collection of birds in the British Museum?—I am.

1633. You are acquainted with the collection of British birds in the Museum?—Yes, I am.

1634. In what light do you consider that?—A very good collection.

1635. Is there any other collection with which you could compare the collection of British birds?—I know no other collection of British birds that can be compared to the collection of those in the British Museum.

1636. Neither public nor private?—Neither public nor private.

1637. In what state are they generally with regard to stuffing and setting up?—Very good.

1638. Do you know Mr. Gould, the person who stuffs birds for the British Museum?—I scarcely know him; I know him from his work as a stuffer.

1639. In what state is the general collection of birds in the British Museum?—The collection of foreign birds is not good.

1640. When you say it is not good, what do you mean?—The old specimens are badly stuffed, and they are in a very bad state.

1641. Will you define what you mean by the old specimens?—Those that have been stuffed upwards of seven or eight years.

1642. The improvement in the art of stuffing has been very considerable within that time, has it not?—I do not think there has been a general improvement in the art of stuffing; I think the excellent stuffing is confined to two or three in London.

1643. Do you know at what period Mr. Gould began to stuff birds for the British Museum?—I do not.

1644. What is the number of birds in the collection in the British Museum?—I cannot state.

1645. Can you state how many known species of birds there are?—No, I cannot.

1646. Have you examined the state of the birds in the Paris collection?—Yes, I have; they are very good.

1647. How are they stuffed and preserved there?—I believe the mode they adopt with some of them has an effect that is well to the eye, but it is not a method that I should approve; a cast is made of the bird, and the feathers placed on, to give it the appearance of the bird; that is done in some cases of birds of paradise, and some few other birds, the skins of which have been difficult to fill out.

1648. Should you conceive that the collections generally in the Paris Museum increase in proportion with the speed of zoological science?—Yes; I think they do, but not so rapidly as they have in the British Museum.

1649. Mr. *Hawes.*] Are the birds generally named both in the British and foreign collections in the British Museum?—I think the greater part are.

Mr. *John Turner.*

14 April 1836.

1650. Did you ever ascertain the proportion named, as compared with the unnamed?—No; I had no motive for so doing.

1651. Are you able to give any opinion as to the scientific value of the nomenclature adopted?—No, I am not, except so far as following the most approved authorities; the nomenclature of Temminck has been adopted.

1652. Will you state in which collection the nomenclature of Temminck has been adopted?—I had occasion to look at the collection of foreign birds, and I saw one or two of Temminck's names.

1653. Can you state whether it is generally followed?—No.

1654. Are you accurately acquainted with Temminck's Work?—No; I know it, but I have it not.

1655. You stated that you have not known nor heard of Dr. Grant as a distinguished conchologist; did you ever hear of him as a distinguished naturalist?—Yes, as a lecturer on comparative anatomy.

1656. May not a distinguished naturalist have sufficient acquaintance with conchology to give a good general opinion as to a collection of shells?—So far as regards a general opinion I think he may.

1657. Are you then willing to bring your own opinion into competition with Dr. Grant's, upon the subject of conchology?—Yes, I think I am.

1658. Do you know the extent of his knowledge upon the subject?—I do not; but I think if he had been an eminent conchologist I must have heard of it.

1659. How must you have heard of it?—By having frequent communication with the principal conchologists of the day.

1660. That is, by having bought shells?—No; if he had been in the habit of visiting large collections, I should have heard that he had been visiting such and such collections, as I do of others.

1661. Do you know anything of the works he has published?—I am not acquainted with any, but I have heard of an Introduction to Comparative Anatomy, of which two parts are published.

1662. You never saw them?—I remember seeing some articles of his in the Edinburgh Philosophical Journal, before he came to London.

1663. Are you acquainted with any one work of his?—No, I am not.

1664. What is the number of species in the Paris collection?—I think about 4,000.

1665. What is the number in the English collection?—I think a hundred or two less; we have nothing like so many specimens.

1666. Supposing the British Museum collection to contain more unique specimens, the number of species being nearly equal, must it not be a great deal more valuable than the Paris collection?—No; the number of specimens in the Paris collection are much greater than those in the British Museum; the unique specimens add to the commercial value of ours, but as a counterbalance on the side of France, they have a greater number of specimens in their suites of species.

1667. Sir *Philip Egerton.*] Are you acquainted with Monsieur Des Hayes?—Yes.

1668. And Dr. Beck?—Yes.

1669. And Mr. Broderip?—Yes; I know him by having had, as a dealer, some transactions with him.

1670. Are not those three gentlemen ranked amongst the foremost conchologists of the day?—I should say that Dr. Beck is one of the first conchologists of the day.

1671. Probably, in your transactions with those gentlemen, you would have heard of Dr. Grant if he had attained any great eminence in the study of conchology?—Yes. I spent the greater part of a day last week with Dr. Beck in Paris; we were then talking of the Paris and London collections. He said, you have a very fine collection of shells in the British Museum.

1672. Lord *Stanley.*] You say that the collection of birds in the British Museum is very imperfect; have you been acquainted with that collection for some years?—Yes; 14 years.

1673. Imperfect as it is now, how was it seven or eight years ago?—It was undeserving the name of a collection of birds some 10 or 11 years ago.

1674. Are you aware to what extent it has been increased within the last seven or eight years?—To such an extent that it has become a moderately good collection from being a very contemptible one.

1675. The improvement has been progressive, and latterly rapid?—I think the improvement in the birds has been equal to that in the shells.

1676. The

Mr. *John Turner.*

14 April 1836.

1676. The space that can be allotted to birds in the British Museum is now completely occupied?—It is crowded.

1677. Then you would not agree with a witness who stated that the birds are spread over a disproportionately large space in the British Museum, to the exclusion of other objects?—That must be matter of taste; but my opinion is that the birds are too much crowded; the same number would occupy twice the space in the Paris Museum.

1678. Sir *Robert Inglis.*] When you refer (A. 1674) to the contemptible state of the collection seven or eight years ago, are you aware whether there were any vacant spaces at that time which could be filled up with birds or any other objects of natural history?—The time I speak of was before the specimens were removed to the new building, and then the space was very small, and crowded with specimens.

1679. Was not, in fact, the whole space occupied with some part of the collection or other?—Yes, it was.

1680. Lord *Stanley.*] Can you give the Committee any information with regard to the collection of corals?—I know it very well.

1681. What is the state of the collection of corals?—We have a very good collection of corals; it has been formed within four or five years.

1682. Then the result of your observation has been, that the shells have increased very rapidly, that the birds have increased very rapidly, and that the collection of corals, which is now a good collection, has been comparatively created within the last six or seven years?—Decidedly.

1683. When you say that the collection of corals is a respectable collection, will you institute a comparison with a similar collection either at Paris or Leyden?—I think our corals are equally good with those of Paris, and they are better than those of Leyden.

1684. And the whole collection is the work of the last six or seven years?—Yes.

1685. Mr. *Hawes.*] The Committee have been informed by one witness that in the conchological department there are many deficiencies; that the number of species of which there are specimens is not at all equal to the number known; is that so or not?—I think there are many common shells that the Museum is still in want of, if they have now only 4,000 species; I think above 8,000 are known.

1686. Therefore the Museum is only furnished with half of the species known?—I suppose that they have nearly half the known species.

Mr. *Edward Turner Bennett*, called in; and Examined.

Mr. *E. T. Bennett.*

1687. Lord *Stanley.*] YOU are the Secretary to the Zoological Society?—I am.

1688. Have you acted in that capacity for some time?—For the last three years; before that time I was connected with the Society for several years as vice-secretary.

1689. You are a member of the council?—I am.

1690. And Fellow of the Linnæan Society, and editor of the Zoological Journal?—I took a large share in the editing of that work during its continuance.

1691. You have also edited several other papers and works upon the subject of zoology?—Yes.

1692. Of course you are conversant with the state of the Zoological collection of the British Museum?—I am.

1693. You have been in the habit of seeing it for a considerable number of years?—For many years; I think for nearly twenty years.

1694. Have you watched its progress for some years?—Yes; and I have seen it constantly progressing.

1695. Has the progress been such as to give you satisfaction, and to give you a favourable impression of the system upon which the management of the Museum has been conducted?—The progress has been very rapid and very considerable.

1696. How long have you known the British Museum?—About 20 years.

1697. What was the state of the zoological collection as to the mammalia and the birds when you first knew it?—When I first knew the collection, nearly the whole of the mammalia and the general collection of birds were contained in one small room, in the room which Mr. Gray now has for a working room.

1698. Of course at that time there could be no arrangement or classification of either

Mr. *E. T. Bennett.*

14 April 1836.

either the one or the other?—The best that the space would afford, and the best that the collection was equal to.

1699. What was the state of the specimens which they had at that time?—I am afraid that I cannot answer that question; I was but a young student at that time.

1700. From what period do you date the general improvement in the zoological collections in the British Museum?—Probably from seven to eight years ago; at the time that more space was given to zoology, from that time the great increase in the zoological collections commenced.

1701. The space which is now applicable to objects of zoology is completely occupied?—It is in some parts crowded.

1702. Will you give your opinion as to the state of the arrangement and nomenclature, bearing in mind the difficulties under which the Museum still labours with respect to space?—The mammalia are at present much scattered, which is chiefly owing, I apprehend, to the want of space. There are some of them upon the staircase, some of them in the room devoted to the mammalia, and some of them in the adjoining room over the cases. That, I apprehend, is entirely owing to want of space; for there is no single room capable of containing the collection, with the exception of the large room in the new building, in which the general collection of birds is placed. The collection of birds is sufficiently accommodated for its present extent, although it is in some parts crowded; as there is sufficient space for that collection, I believe that the arrangement is satisfactory. The British birds have ample space appropriated to them, perhaps more than is absolutely required for them, and their arrangement is good. The reptiles are put into genera; they are not in that state of complete arrangement which would be desirable eventually. The fishes also are arranged in genera; but in some instances they are placed in masses as the collections have reached the Museum. The insects, I believe, are well arranged in the extensive series of cabinets that the Museum possesses. The shells are also arranged in the very extensive series of tables that are appropriated to them. The corals and the radiata are very fairly arranged.

1703. Applying yourself for the present to the mammalia and the birds, do you consider that as much has been done with regard to the arrangement, particularly with regard to that of the mammalia, as was possible to be done consistently with the limited space afforded by the present buildings?—I believe so. Additional space might be obtained by putting a gallery over the cases in the large room occupied by the mammalia; but whether there would be sufficient light for such a gallery I cannot say.

1704. You mean the saloon in the old building?—Yes.

1705. Would you have thought it desirable, looking to the general condition of the old building, and the state of progress of the new buildings, to have erected a gallery in the saloon for the purpose of a new classification there?—Being aware that within a moderate time a good space would be acquired, I probably should have been contented to have made the best use of the existing room, without incurring expense, to add slightly to it. The existing room might be regarded, in the interval, as a store room.

1706. What is the condition of the specimens of the mammalia in the British Museum?—Many of the older specimens are in a ragged condition; but those which have been recently introduced, are, generally speaking, good skins, and have been well stuffed.

1707. The attention of the Committee has been particularly called to the two specimens of the giraffe and the lama, as instances of bad stuffing. Do you happen to know where they came from?—The lama came from the College of Surgeons, very recently; I think within the last 12 months. The trustees of the Hunterian collection presented it to the trustees of the Museum. It is very badly stuffed; it was an old object, and badly stuffed originally.

1708. Are you aware that the giraffe was also sent stuffed from the College of Surgeons?—I am aware that there was a giraffe at the College of Surgeons, but I do not know which of those at the Museum was the one that belonged to the college. It was standing in the College museum for years, covered with dust. It was probably never good, and is certainly now very miserable.

1709. Sir *Robert Inglis.*] The specimens bear respectively the names of the donors by whom they have been presented?—I have not attended, in this particular instance, to the labels attached to the specimens. I am aware that there have been

been giraffes for many years at the head of the staircase, and have not distinguished which was the one that lately arrived there.

1710. Lord *Stanley.*] Does it appear to you that sufficient care is taken by the officers of the Museum, in attending to the preservation of the specimens in the condition in which they now are?—I am not aware that there are any specimens exposed that are likely to be damaged by exposure. I think that those giraffes, for instance, are not likely to be damaged by any treatment they may meet with.

1711. You would not therefore coincide in opinion with a witness, who stated that many of the most valuable specimens were at this moment exposed to dust, and to the ravages of insects, and were suffering from the culpable neglect of those persons who have to attend to them?—I am not aware of any instance of a specimen in good condition, and liable to injury from dust, being exposed to it.

1712. With reference to the proposal to build a gallery in the saloon, you cannot speak as to the safety of such a proceeding?—Not at all; I spoke only of a space that might possibly be created.

1713. You cannot suggest any other mode in which, in the old buildings, additional space could be obtained for the objects of zoology?—I believe not. I am aware that a large proportion of the rooms are literally filled with books, and I do not see any part of the present building that is not filled with objects connected with the institution.

1714. With the space which at present is at the disposal of the Trustees, can you imagine any arrangement which would allow of the exhibition of a greater number of specimens, and of a better classification than now exists?—I can conceive that in some departments a better classification might be made, if there were more time at the disposal of the Trustees: that is to say, if the Trustees, by having more officers, had the disposal of more working hours.

1715. Do you conceive that the system of arrangement which has been adopted in the British Museum, with reference to the mammalia, is that which is best calculated for assisting the advancement of science?—With regard to the arrangement of the specimens, I have stated, that owing to the limited space the officers have not the power of making the most advantageous disposition of the collection. With regard to the classification, I may state that the plan that has been adopted has been to follow some accepted authority, with respect to each department; that perhaps is not the course that should eventually be followed in a national institution; although at present it may be very convenient. A national institution, having a large collection, (or indeed any extensive collection,) affords opportunities for improving and advancing the science, and not merely for embodying the views of an individual who has previously written respecting it. According to the extent of the collection placed under the disposal of competent men, would be their power of advancing science; not merely showing what it is at this day, but carrying it forward.

1716. You would not, however, recommend any arbitrary deviation from the fixed system of classification, according to the best authorities?—It appears to me that those authorities have themselves been created by deviating, in various degrees, from the authorities who preceded them.

1717. At the present moment, whose arrangement and classification, with regard to the mammalia, should you consider to be of the highest authority?—Cuvier's, I believe.

1718. You are aware that his classification is that which is adopted, with some slight variations, in the British Museum?—I am aware of it; it is not the classification which is adopted in the museum of the Zoological Society, which may, by some, be considered as an arbitrary one; but which is, in reality, an attempt at a more natural classification. There is, however, no published work in which that system is explained in sufficient detail, to enable the student to follow it out; there are partial sketches of it, but it is not yet worked out in a published form.

1719. You would not be disposed, in the present state of the collection, to censure the following the system of Cuvier, with such trifling deviations as the discretion of the person charged with that department might point out from time to time?—It is perhaps the most convenient plan for the student.

1720. At the same time it is desirable that no deviation should take place without a notice?—Deviations must, in some instances, take place on account of the accession of new subjects.

1721. Sir *Robert Inglis.*] With regard to the nomenclature to be adopted, you have

Mr. E. T. Bennett.

14 April 1836.

have referred to the improvement of science, which an improved nomenclature might promote; do you consider that a museum is an institution for direct instruction in science, or for the depository of the objects of science?—I consider that any extensive collection of the objects of science would induce those who are charged with the care of them to endeavour, in proportion to the opportunities afforded by the possession of such collections, to advance the science to which they relate

1722. But the keepers of such collections would have only the same individual authority which the Cuviers or the Linnæuses of another age have had in their respective works?—Merely so.

1723. It would still rest then upon the authority of the individual keeper of the particular department, whether in a museum, properly so called, or in any institution for the direct and specific purpose of the advancement of science?—Yes.

1724. You have referred to the imperfect state of the collections 20 years ago; do you wish the Committee to understand that such imperfect state was owing to any want of science on the part of those who were at that time the officers in charge, or to the want of space in the buildings to receive and display either what they had, or what they might desire to receive?—In the part of the house that was accessible to the public, there was evidently want of space for a large collection. Whether at that time the Museum possessed a collection in store I am not prepared to state.

1725. Was the imperfect state owing to any want of science on the part of the officers then in charge?—I think the earliest of my acquaintance with the Museum must have been in the time of Dr. Shaw, whose publications are very generally known. They are not works equal to the wants of the present time, but they were respectable with reference to the then existing state of zoological science in England.

1726. Were there any higher authorities at that time?—At that time the zoologists of the Continent, and especially those of France, had very considerably advanced the science which they cultivated; but our connexion with the Continent was not so intimate during the war as it became immediately after the years 1814 or 1815: and probably the improvements in classification that took place during that time on the Continent were not so well known here as they have subsequently become. Perhaps also they might not, at that time, have been appreciated as they have since been.

1727. The taste for zoology was increased by the intercourse with the Continent?—The first step in the recent advancement of zoology as a science in this country certainly was contemporaneous with the opening of the intercourse with the Continent.

1728. But at the time when you first knew the Museum, was there a higher authority in England on the immediate subjects committed to him than Dr. Shaw?—On those subjects generally, there certainly was not.

1729. You do not attribute to any want of science on Dr. Shaw's part the imperfect state of the collection?—No; England possessed then, and it still possesses, one of the highest authorities on the species of ornithology. Dr. Latham, more than 50 years ago, published his "General Synopsis of Birds," which immediately became a standard work, and still remains a work of authority, although his arrangement is now altogether obsolete. For species, however, it is yet valuable, and necessary to be consulted by all students.

1730. Lord *Stanley*.] What would have been your opinion of the prudence of the course pursued by the Trustees of the British Museum, if they had, in the present state of the buildings and of the collection, laid out large sums in the last few years in the purchase of specimens of mammalia?—I have thought it desirable, with reference to the Zoological Society, on various occasions, when objects have been offered for sale to the council of that Society, to look forward to the time when we should acquire the means of accommodating the specimens; and, contrary to the opinion of some of the members of the council, have urged the acquisition and the safe storing of objects that we could not at the time exhibit, but which we hoped to be able to exhibit hereafter. There are many objects, opportunities for acquiring which occur from time to time, and may not perhaps soon occur again; and I have therefore thought that opportunities of securing such objects at moderate prices should never be lost.

1731. The question rather applied, not to the purchase of any very rare specimens that happened to occur, but to an endeavour to fill up a collection which

was very imperfect, while you had no space in which you could arrange and classify them?—The possession of skins of common objects, even unstuffed, would be advantageous. They might be so kept in well arranged stores as to be capable of being referred to by any person desirous of consulting the collection.

1732. Bearing in mind that the purchases of the British Museum are at the expense of the public, do you think it would have tended to give satisfaction if a large proportion of the Parliamentary grant had been laid out in the purchase of objects comparatively perishable, and which could not for many years be exhibited to the public?—Without a prospect of shortly acquiring the means of exhibiting them, I should have hesitated in purchasing largely.

1733. You are acquainted with the ornithological collection in the British Museum; what do you consider to be the condition and the state of completeness of the British collection of birds?—The condition of it is generally good; and it makes a very near approach to completeness.

1734. As a separate collection is it very complete?—It is.

1735. Do you think it desirable that there should be a separate collection of British birds, being complete as it is, or that they should be incorporated in the general collection?—In that particular instance I believe I should be willing to keep such a collection separate. It was the collection of Colonel Montagu, whose Ornithological Dictionary is a standard work in British ornithology; and therefore the mass of these, being his actual specimens, acquire a distinct and additional value as compared with ordinary British specimens. Generally speaking, I should, however, prefer to blend collections into an entire system.

1736. Are you acquainted with the progress which has been made in the last few years in the general collection of birds in the British Museum?—It has been very considerable.

1737. Though still very imperfect?—Though still not the collection that it should be.

1738. With regard to the birds, are there any means, in the present state of the British Museum, of exhibiting a larger number of specimens than are now exhibited, or of giving them a more perfect classification?—I think there are not. It is possible that a different arrangement of shells might give accommodation for a few more, but not for any large number; and in some cases they are so crowded that the small additional space which might thus be obtained would be advantageously occupied by the more open distribution of the specimens in these crowded cases.

1739. You would not say that a disproportionate amount of room was wasted upon the birds?—Birds are so very attractive, and so very beautiful a class of the animal kingdom, that I believe in most museums, and certainly in that of the Zoological Society, they occupy a large proportional share of the entire space for exhibition.

1740. In the British Museum, would you be of opinion that a disproportionate space is allotted to them?—In most museums, birds occupy a space perhaps disproportionate; I should say that at present the birds have proportionally much larger and better accommodation than the mammalia.

1741. But still the birds are rather crowded than otherwise?—Certainly.

1742. Is the nomenclature of the birds, and the classification generally, satisfactory to you?—It is generally satisfactory. The arrangement followed is not that which I should myself have adopted, but it is part of the system to which I have before alluded, of adopting the classification of some competent accepted authority.

1743. The system which has been followed is that of Temminck?—It is.

1744. Is he considered as good an authority as any?—He is very generally so considered.

1745. You would not point out any system which you would prefer to that of Temminck?—A system has been sketched out which I should unquestionably prefer to that of Temminck; but it has not been pursued into all its details, neither indeed has that of M. Temminck.

1746. You are acquainted with the collection of shells in the British Museum; what is your opinion of that collection?—It is an extensive collection, has very much increased of late years, and is very extensively named.

1747. Are you aware whether, in proportion to the number of specimens, it is one of great scientific value?—I believe that it is.

1748. Have you any collection of shells in the Zoological Society?—Nothing

Mr. *E. T. Bennett.* 14 April 1836.

at this moment that can be called a collection; but the Society will probably soon acquire a collection. An agreement has been entered into, by which it will be optional with it to acquire a very extensive collection upon certain terms.

1749. You mean the collection of Mr. Cumings?—Yes.

1750. Will you give the Committee an account of the negociation between the Zoological Society and Mr. Cumings, and the condition under which you have now the prospect of obtaining that collection?—Mr. Cumings stated his wish that his collection should be open to public view. He was desirous that it should be exhibited through the medium of the Zoological Society rather than of any other body. He was also very anxious that it should be well exhibited, and that all the specimens contained in it should be shown; and he stipulated that the Society should not become possessed of it until they had provided accommodation adequate for the exhibition of every specimen, not in drawers, but in glazed cases. In order to secure this, and also to secure his collection against being dispersed, he entered into an agreement to vest the collection in trustees, in trust that they, when the Zoological Society had provided sufficient accommodation for it, but not until then, should place it with the Society for the purpose of exhibition. Mr. Cumings reserved to himself to be the first curator (for the appointment of a curator of the collection is one of the conditions), and stipulated for a fixed annual payment to be made to him from the time of his entering on the duties of that office.

1751. Supposing that at the end of the period the Zoological Society should not have complied with the terms of Mr. Cumings' proposal, what becomes of the shells in that case?—In the event of the Society not having within ten years provided accommodation satisfactory to Mr. Cumings, if alive, or to his trustees in the event of his decease, the collection reverts to Mr. Cumings, if he be then alive, and if he be dead it goes to the British Museum, accompanied by a copy of the deed of trust, with the view of indicating to the Trustees what were the wishes of the individual to whom the public are indebted for the collection.

1752. You stated that Mr. Cumings preferred the Zoological Society as the depositary of his collection of shells; will you state what you presume to have been the reasons of that preference?—One of the reasons, perhaps a very influential one, was a desire on his part that his collection, being a very extensive one, and entirely made by himself, should form the basis of a collection, to be called "The Cumingian Collection of Shells," a name which, according to the terms of the deed of trust, must be applied to it by the Zoological Society in the event of their becoming the depositaries of it. Of course, the addition of his shells to an extensive collection previously formed, would not have entitled him to claim the affixing of his name to the entire collection.

1753. Then you are not of opinion that Mr. Cumings declined, in the firs instance, offering his collection to the British Museum, from thinking that the specimen would not there be taken care of, but from feeling that the collection was already so large that it would not be consistent with the arrangement of the Museum to keep his collection separate and distinct?—I have said that it was one of his objects that his shells should form the foundation of a collection bearing his name. Another motive for his preference of the Zoological Society was, that a very large proportion of the great number of his novelties had been made known through the medium of the Society's publications, and were consequently, to a certain extent, already identified with the Society. A third motive was his unwillingness that his shells, which are, generally speaking, very perfect specimens, should be dispersed among others, some of which, in his estimation, were not so elegant or perfect as his own.

1754. Have you any catalogues in your collection in the Zoological Society?—Our catalogues are very imperfect. I can scarcely call them catalogues. We have some inventories; an inventory complete in one department, commenced in another, and partially commenced in one or two others.

1755. Have you ever seen any catalogues of any Continental museums?—The most extensive catalogue I ever saw of any public Continental collection is the catalogue of the Cabinet of Comparative Anatomy in Paris, prepared for the purpose of showing its condition at the time of the death of Cuvier.

1756. Do you think it would have been desirable that the Trustees of the Museum, in the present state of that collection, should have attempted the formation and publication of catalogues of their collections?—I am not sure that at any time a catalogue of the entire collection would be a desirable object for publication;

159

publication; but it is unquestionably desirable that catalogues should be prepared.

1757. But you would not recommend a publication of any catalogue in the present state of the collections, and in the present state of the locality of the Museum?—Certainly not of any full catalogues.

1758. In what manner have you principally increased your collections in the Zoological Society, by purchase or by exchange?—Principally by presents; in some measure by purchase; and very little by exchange. We have in one or two instances received specimens from Continental museums, and we have given other specimens to those museums; but as a matter of pride or of feeling, we have given a present and have received a present; it has been wished not to consider the transaction in the light of barter.

1759. Have you in making purchases ever purchased a considerable number of specimens which you already possessed, with a view of afterwards exchanging those duplicates with other bodies?—In no instance.

1760. Would you consider that a desirable mode of proceeding for any public institution, and especially for such an institution as the British Museum?—I should think not.

1761. Are you acquainted with the constitution of the British Museum?—I am aware generally that the property is vested in trustees, who are partly official, partly the representatives of certain families, and partly elected by the other trustees.

1761*. Do you think this is a mode of government which is likely to produce a body of trustees, who would give their attention to the interests of the Museum, and promote the cause of science in the different departments?—I am not prepared to answer that question.

1762. Would you consider it desirable to substitute for such a board of trustees, a board which should be composed of scientific men as such in the different departments which are contained in the British Museum?—I should hesitate much in recommending such a substitution.

1763. You do not think that it follows, that a man particularly distinguished for his scientific attainments in a particular branch, is therefore necessarily a desirable person to have as a trustee of such an institution as the British Museum?—As a trustee, perhaps not; I can conceive the possibility that a person attached to a particular department of science, and placed on that account in the situation of a trustee, might interfere with the officers charged with that department, to a greater extent than would be agreeable to them or beneficial to the institution.

1764. Do you conceive that the officers at the head of separate departments in an institution, consisting of a great number of departments, would rather prefer being subject to the control of a general superintending board of men of education and of great attainments, than being subject to a board in which each of their separate departments should be represented by some person distinguished for his attainments in that particular branch?—I conceive that generally the officers of the departments would rather refer to a board of men of general education and general information, than to such a board as the one spoken of.

1765. You conceive that the officer at the head of each department would feel himself more free to act, than if he were subject to a superior authority in his own immediate department?—In that case I apprehend he would think that he had one person to whom he should, on all occasions, more especially refer; and he would rarely be disposed to act without consulting the trustee whom he might look upon as his more immediate director.

1766. And you would desire that the officer at the head of each department, supposing him to be a competent man, should have considerable latitude given him in the management of his department?—Very considerable.

1767. Is it not important, in order to procure the services of scientific men, that a considerable latitude should be given to them?—I think so. I think too that any scientific man would work with more energy, being aware that the whole credit of the arrangement and condition of his special department would redound to himself.

1768. What is your opinion generally of the officers who from time to time have been appointed to the heads of the different departments of the British Museum, as men of science and attainments?—My experience is much more limited than the question implies; but the whole of those that I have known have been

Mr. *E. T. Bennett.*

14 April 1836.

been men either well versed in their different departments, or desirous of making themselves well acquainted with them.

1769. Are the officers at the heads of the different departments or sub-divisions of departments in the British Museum, men of science in those particular departments to which their attention has been turned?—Generally.

1770. Mr. *Hawes.*] In all cases?—Perhaps not in all cases in the particular departments to which they were appointed.

1771. *Chairman.*] Has the collection of Colonel Montagu, which you alluded to, deteriorated in condition since it was purchased?—I am not aware that it has generally; but some of the specimens that were in bad condition when it was purchased have, I believe, been from time to time replaced by others.

1772. Has it been well kept?—It has, as far as I am aware.

1773. Do you think that your specimens at the Zoological Society are altogether in better condition than those in the British Museum?—They are probably, as regards the preparation, as nearly as possible in equal condition as the more recent ones in the British Museum, both having passed through the same hands in the preparing and setting up.

1774. Your giraffes, for instance?—They are in a very different condition from those which have been exposed for so many years, ours being both of recent acquisition. We have two giraffes: one which belonged to his late Majesty, and died at Windsor, and one which it was intended to import living from the Cape of Good Hope about two years since, but which died very shortly after it was embarked.

1775. Mr. *Hawes.*] Have you visited the British Museum often?—Frequently. I have gone there whenever I have had occasion to consult specimens contained in the collection.

1776. Over what period of time has that extended?—My early visits were more than 20 years ago. My occasional visits for the purposes of consultation have extended over about 10 or 12 years.

1777. And you have seen a remarkable improvement of late years?—Yes.

1778. What was the state of the catalogues 20 years ago in the Zoological collection?—I cannot speak of the catalogues at that time.

1779. What is the state of the catalogues at present?—I believe that in most of the Zoological departments there are useful catalogues in the possession of the officers.

1780. Will you state one?—I had occasion about two or three months ago to examine the British bats. Mr. Gray then laid before me all the specimens of British bats contained in the Museum, and he laid before me at the same time a catalogue of the entire collection of bats. There were numbers and letters referring to each particular specimen; the names of those species were entered, and the localities from which they were obtained were also stated.

1781. Will you describe of what portion of the collection that was a catalogue?—I consulted it only with reference to the bats.

1782. Have you examined any other catalogue?—I have seen a catalogue of the insects; another of the British birds; and a general catalogue of the reptiles; I have also seen preparations for a catalogue of the shells.

1783. Can you speak accurately as to the state of the catalogues you have seen; are they complete, comprising the entire of the collection?—I have never compared any of the catalogues with the collection.

1784. Do they profess to be entire catalogues?—The catalogue to which I more particularly referred, was given to me to aid me in my research, to prove to me that the specimens I was consulting were really British; a catalogue was put into my hands which stated the precise locality in which each individual was obtained.

1785. What specimen was it to which you referred?—I think there were 12 or 13 species of British bats.

1786. Will you mention or describe the exact mode in which it is entered in the catalogue?—The catalogue is in Mr. Gray's writing. The species which he considers as true vespertiliones are thus entered in it:

No. of Species.	NAME AND SYNONYMA.	Habitat.	Donor.
35	Vespertilio Serotinus, Schreb. Fischer, Mamm. 103. Vespertilio Noctula, Geoff., Ann. Mus.	*a** England, London.	Dr. Leach.
36	Vespertilio Nattereri, Kuhl Watter. Ann., Fischer, Mamm., 102.	*a* England, London; *b* ditto.	Mr. Gray. Ditto
37	Vespertilio discolor, Natt. Kuhl, Wett. Ann. Fischer, Mamm., 104.	*a* Plymouth.	Dr. Leach.
38	Vespertilio mystacinus, Leist. Kuhl, Wett. Ann. Fischer, Mamm., 105.	*a* Devonshire. *b* Cambrige.	Dr. Leach. Rev. L. Jenyns

* Mark of individual specimen.

Each of the articles is entered on a separate page of the MS. List; which will allow of their being at any time arranged according to the system which may be adopted.

1787. Are those catalogues generally known to the visitors of the Museum?—I do not know that they are.

1788. Does it require individual application to the keeper of the department to obtain them?—I should apprehend that it does.

1789. So that the public generally have no advantage from the catalogues which exist?—The public generally, I apprehend, require no such advantage. Such information is interesting to students only.

1790. Sir *Robert Inglis.*] You are making a distinction between the public and the scientific student?—Yes.

1791. Mr. *Hawes.*] Are there any means taken to inform the students generally that the catalogues are accessible?—I am not aware that there are.

1792. So that a student might visit the Museum, not knowing the keeper, and not have the advantage of such a catalogue?—It is to be presumed that any person advancing in the study of any department of natural history will become acquainted with others who are pursuing the same study, and will, through that acquaintance, acquire introductions and general information as to the facilities that can be obtained.

1793. But a stranger visiting the Museum for scientific purposes would have no means of knowing that there was a catalogue?—I am not aware that he would, unless it be mentioned in the Synopsis, without inquiring of some person connected with the department.

1794. Have you seen the catalogue of the College of Surgeons?—I have seen various parts of it.

1795. Are you aware that that is published in parts?—Yes.

1796. Are you aware that it meets with a sale?—I believe that it does.

1797. Why do you think that the publication of such a catalogue, in reference to the Museum, would not be equally advantageous, as in the case of the College of Surgeons?—In the case of the College of Surgeons, much of the catalogue is devoted to the description of particular specimens. The descriptions given in that catalogue are, in fact, chapters in natural history, physiology or pathology.

1798. Is it or is it not a valuable publication?—Exceedingly valuable.

1799. Why should not a similar publication of equal value be produced of the collection in the British Museum?—The natural history collections of the Museum are of a different class from the anatomical preparations which, in a great measure, compose the collection in the College of Surgeons, and from the specimens of morbid alterations of structure, which constitute a great part of the remainder.

1800. Why should anatomical and pathological collections be susceptible of greater interest than objects of natural history?—Many of the specimens in the College of Surgeons are illustrative of facts connected with the individual specimens, which are often new to science. The description of the great mass of the objects in the British Museum would make known no subjects but those actually described in works already published.

1801. Would not it make known the number, value and extent of the specimens existing in the collection?—If we were to take the mammalia, for instance, I should

Mr. E. T. Bennett.

14 April 1836.

should say that little advantage would be derived from the publication of a catalogue of such a collection as at present exists in the British Museum.

1802. Is that because the collection itself is poor?—Yes, as compared with the number of species known.

1803. Assuming the collection to be a vabluable one, does no advantage arise from the publication of a catalogue?—I would prefer the publication of an entire catalogue, marking the things that were or were not possessed.

1804. Can you anticipate the time when a perfect collection will ever be made?—It is impossible.

1805. Would you delay the publication of a catalogue till it is complete?—No; I should prefer publishing a complete catalogue of the department of science; in fact, a species of that department, indicating the objects possessed, and consequently those which are deficient.

1806. With a view to inform the public what exists and what does not exist, both of which are valuable to the student?—Yes.

1807. Then in fact you are in favour of the formation of an accurate catalogue of the Zoological department?—As part of a general system of zoology, rather than with reference to the Museum itself.

1808. But that gives it a higher value in the estimation of scientific men?—Yes.

1809. Therefore it is still more desirable that the publication should take place?—Yes, as regards science generally.

1810. You have been asked some questions respecting the constitution of the Museum, and you have stated that you think a combination of official, family and elected trustees is in favour generally of the promotion of science?—I think, with reference to that question, I gave no answer.

1811. Now supposing the Trustees were composed of some of the most distinguished men of the present day in the various departments of science, and suppose under them, appointed by them, were distinguished men, who were to act as professors, and in whom the general management of the Museum was to vest, the details being in the hands of this board of professors, the general government and responsibility or control being in the hands of this body of scientific trustees, what is your opinion of such a constitution?—I think I have already objected to scientific trustees, as such, on the ground that there might possibly be more interference by them than would be agreeable to the officers in charge.

1812. Then you think a trustee of general education is better able to direct and to look after the Zoological department than a trustee who is himself an eminent zoologist?—I assume that in that case there would be little disposition on the part of the trustee to interfere with an officer who is a zoologist.

1813. Therefore you would wholly leave the management of the department to the zoologist at the head of it; and you think it not desirable to place any competent person over the head of that department, to ascertain whether he does his duty to the public?—I think it scarcely desirable that a person should be appointed as a trustee solely on account of his competence in any particular department.

1814. Supposing an eminent zoologist to be a man of rank; would he not be more competent to look after an officer of the Zoological department than a man of rank who is not a zoologist?—Assuming that he does not interfere, or that he interferes very little, with the details of the department, I should say that he would be a valuable trustee.

1815. Then you prefer a board of trustees who interfere very little, and who themselves have little particular information with respect to the different departments under their care?—I prefer such a board composed of men of general information, to one the members of which might be tempted to interfere unnecessarily.

1816. That it should be a board of honour, and not a board of work?—Not a board for directing the details of the departments.

1817. And you think that very advantageous to science?—I think it more advantageous than a board which would remove the responsibility from the heads of the departments.

1818. But suppose the board did not remove the responsibility from the heads of the departments, that the responsible management of each department rested entirely

entirely in the hands of the head of the department only, controlled by the board as scientific trustees, as to the general discharge of duty, in that case do you think that any disadvantage would accrue?—I do not think that a board of scientific trustees would be a special advantage, and I assume that there would be disadvantage resulting from it, if it led to the effects that I have anticipated.

1819. Is any one of the trustees more than another distinguished for his knowledge of natural history at present?—There is one.

1820. Will you name him?—The Earl of Derby.

1821. Would you remove him from the board of trustees?—No.

1822. Why not, upon your principle?—I have no idea that he interferes in the way that I have stated.

1823. But the moment he applied his particular knowledge of that department in the management, you would remove him?—No, I would not.

1824. But with reference to his situation as trustee, you do not attach any value to his knowledge of natural history?—His knowledge is advantageous while applied to the general management, without interfering in the details of the department with which he is conversant.

1825. Suppose there to be an eminent antiquary elected, and to be elected because he was an eminent antiquary, according to the constitution of the Museum, would you in that case restrict him from more particularly looking after the antiquarian department of the Museum?—It might be advantageous in one point of view. It would be advantageous, for instance, to have trustees who would see the deficiencies of the collection in the several branches with which they are specially acquainted, and would feel a particular interest in supplying them.

1826. Then there would be some advantages in having trustees who were distinguished for their knowledge of particular departments?—The advantages that I adverted to in my last answer.

1827. You would not exclude them altogether from the trust?—No; I am of opinion that advantages might be derived from their appointment. I have suggested also that disadvantages might result from it. It would be advantageous, of course, that there should be a degree of interest taken by the individual trustees in the several branches intended to be promoted by the institution.

1828. It appears then, in your opinion, an advantage where a trustee possesses particular knowledge, but it is a disadvantage where he applies it?—The disadvantage consists in his interfering with the officer of the department in the arrangement and distribution of the objects.

1829. Supposing his knowledge of that particular department dictates that interference?—Yes. I consider it objectionable that any trustee should undertake the direction of details.

1830. May it not therefore be inferred from your evidence, that it is to be considered to the advantage of a trustee that he should have scientific knowledge, and that it is to be considered a disadvantage when he uses it in the particular department in which he is best qualified to use it?—I have stated in my previous answers that advantage might result from his using his knowledge to increase the collection, but not from his application of it in the disposal, arrangement and distribution of the department, which should, I think, be left to the officer in charge of it.

1831. *Chairman.*] Do you regard the duty of a trustee to be general supervision, and not detailed direction?—Yes.

1832. Is that the meaning of the answers you have given?—Yes.

Martis, 19° *die Aprilis*, 1836.

MEMBERS PRESENT.

Mr. T. G. B. Estcourt.	Sir Philip Egerton.
Sir Robert H Inglis.	Mr. Ridley Colborne.
Lord Stanley.	Mr. Bingham Baring.
Mr. Hawes.	

MR. T. G. B. ESTCOURT, IN THE CHAIR.

Mr. *E. T. Bennett*, called in; and further Examined.

Mr. *E. T. Bennett.*

19 April 1836.

1833. Mr. *Hawes.*] ARE you a brother of the Mr. Bennett who is engaged in the British Museum at present?—My brother has been for several years an officer in the Banksian department; he has been in it since its formation.

1834. I think you stated, in your former examination, that the arrangements and nomenclature in the natural history collection, keeping in mind the space that could be devoted to it, was as good as could be expected?—My answer on that occasion referred principally to the arrangement, considered with reference to the present space; want of space would not prevent the naming of the specimens; and the naming of the specimens is not so complete as could be wished.

1835. To what extent is it deficient, and to what do you attribute that deficiency?—Among the fishes especially, the naming is not so complete as in other departments.

1836. Have you examined the collection with accuracy, so as to be able to give evidence on that point?—I have not; my statement is founded on a general observation of the tickets attached to the specimens.

1837. And with regard to the naming of the individual specimens, you are not now able to speak of the proportion the named specimens bear to the unnamed?—I think that nearly the whole of the mammalia are named, and that a very large proportion of the birds are also named.

1838. Do you know Mr. South, the naturalist?—I do.

1839. Do you consider him, as a naturalist, one whose authority should have weight with the Committee in giving his opinion?—Yes.

1840. Suppose Mr. South did not think most of the mammalia rightly named, how would you reconcile that with the statement you have made?—I should refer to my former answer, that I have not so closely looked at them.

1841. There may be deficiencies in the nomenclature on that point, without your being able to give any information on the subject?—Not considerable.

1842. Mr. South states (1125 page 27) with reference to the mammalia, "I do not think most of them are named." Will you affirm or contradict that statement?—I will neither affirm nor contradict it; but my impression is, that most of them are named; I speak to a general impression from an inspection of the cases, without having looked so closely at them as to make a proportional statement.

1843. Speaking of the collection generally, which do you consider has hitherto been considered most useful to science, the collection in Paris, at the Jardin des Plantes, or the collection at the British Museum?—Science has certainly been more benefited by the collection at Paris, than by that in the British Museum.

1844. Will you state why science has derived more advantages from the Paris collection than the London collection?—There has been a greater number of active men engaged in making known to the scientific world the contents of that collection.

1845. When you speak of active men, do you not mean by that, men of distinguished science?—I do.

1846. Do you know the part which those naturalists have taken in the management of the collection in Paris?—I believe that each department is in charge of a professor and an assistant.

1847. Do those professors form a board for the general management of the collection?—I have so understood.

1848. Do you trace any connexion between the greater utility of the Paris collection

collection as compared with the London collection, between the board so composed and the consequent benefits that are accruing from that collection?—I believe that it is useful that the persons in charge of different parts of the collection should understand each other's views and wishes, and in that way such a board would be advantageous.

1849. Then may it not be inferred, that a similar board, composed of men with similar qualifications, would be equally efficient in London?—The British Museum is not a museum of natural history only. If there were a museum of natural history alone, I can conceive that a board of heads of departments might be very advantageous for all natural arrangements.

1850. But confining the examination at present simply to the natural history department, comparing it in that respect with the Paris institution, do you think a board of officers, with the general direction of that department, would be more beneficial than the present system?—I think that it might be so; looking upon it as distinct from the rest of the Museum.

1851. Would you place such a board under any control or superintendence?—I should, in such a case, suggest that there should be another board, a superintending board.

1852. Composed of what kind of men?—Most advantageously, probably, composed to a considerable extent of official persons; that is to say, of that class of official persons who, by their direct connexion with the executive government, with the colonies, and with the army and navy, might be able to afford facilities for the improvement of the collection. I think that another class of official persons might be added to these, consisting of the presidents of those learned bodies, chartered societies of London, which are devoted to the particular departments that would form part of such a museum. To these might, perhaps, be advantageously added a certain number of persons who had themselves contributed, or whose families had contributed, to increase the collection. There might also be added a few, but probably no large number of, elected trustees.

1853. Official trustees, who have considerable public duties to discharge, are the parties to whom you would look for the management and direction of this museum?—I should look to them in part, considering that great advantage might be derived to such a museum, from the persons more immediately interested in it being brought into contact with those who had the power of increasing the collection, through the intervention of their agents or officers in different parts of the world; say, for instance, the Foreign Secretary: through the consuls he might aid very materially in increasing the collection of such a museum.

1854. Sir *R. Inglis.*] And the Colonial Secretary?—Yes.

1855. Mr. *Hawes.*] This board would be a board controlling and directing the officers?—Not in details; and I should scarcely propose to give to such a board control and direction, but rather general supervision.

1856. You would expect them to attend sometimes?—Undoubtedly.

1857. Suppose it should turn out, from an examination of the attendance of the official Trustees, that they have hardly ever attended the Museum, would you continue them?—Looking to the advantages to be derived from their co-operation, I should still recommend that they should form part of such a board, in the hope that in the succession of officers, some would be found who would take that interest which others perhaps might not.

1858. Do you think the Lord Chancellor might be one?—He would scarcely form an essential part of the board of a museum of natural history, constituting, as I am now assuming, a distinct establishment. The two principal officers of the Government might well be connected with such a board, although they might give very little attendance to it.

1859. What duties would you impose on them?—Merely to act as Trustees, in conjunction with others who might have more time to devote to attendances.

1860. Do you not think the Trustees could avail themselves of their services when they required them?—Perhaps not so readily or effectively as if they were themselves interested in the trust.

1861. What is the difference between an official Trustee, who never attends, and a member of the Government, who may be supposed willing to listen to the improvements with reference to the Museum?—It seems to me that if you could bring such official persons together in a board, you would, by making them a part of the board, interest them more in its objects, than by merely going to them as to persons to whom you were to apply for assistance when wanted.

Mr. *E. T. Bennett.*

19 April 1836.

1862. Do you think the First Lord of the Treasury is likely to attend?—Not to attend often. But he is one of those whom it would be well to connect with the board.

1863. Supposing he never attended, and took no other part than when he was applied to by his brother Trustees, do you think it desirable that he should be nominally a Trustee?—Their applications to him would probably be attended with greater effect in consequence of his being a Trustee.

1864. What do you think of the Attorney-general?—I should scarcely add him to the natural history board.

1865. The Lord Steward?—I should scarcely add him.

1866. The Lord Chamberlain?—The board which I have been led to suggest, would consist of perhaps two prominent officers of the Cabinet (the First Lord of the Treasury and the Chancellor of the Exchequer), and of no other official person connected with the Government, except those whose position would enable them to add to the stores and possessions of the Museum.

1867. In fact men to be made use of when wanted by the Trustees, not to take any other part in the Museum?—Men who, on suggestions being made to them as part of the board of Trustees, by their brother Trustees, or by the officers in charge, would have the power of aiding materially in carrying those suggestions into effect.

1868. But the main management of the Museum you suggest should be placed in the hands of a board of scientific men?—The internal management of a natural history museum might be placed in the hands of a board composed of the heads of the several natural history departments.

1869. Why should not the board of officers, composed of the heads of the departments under their care, be competent for directing the Museum, you having admitted such a board to be best for the Natural History department?—The objects of the British Museum are too miscellaneous to admit of a board being formed from the officers to manage its internal affairs, so advantageously as might be expected in a natural history museum from a board formed of the officers of Natural History only, the several branches of which are more or less intimately connected with each other.

1870. Is there any department whose duties are so miscellaneous as that of the Natural History department?—I have said that the different branches of natural history appear to me more or less intimately connected with each other. I do not see, on the other hand, any appreciable way in which antiquities, for instance, are immediately connected with natural history.

1871. You think it would be difficult for the heads of the other departments, the Printed Book department and the department of Antiquity, for instance, to work well together for the management of those departments?—I scarcely know how to answer that question.

1872. You think a board of naturalists might work well, but a board similarly constituted for the other departments would not; is that the fair conclusion from your evidence?—I can speak less decidedly of those departments than of the natural history; but even in them there might possibly be a subdivision. Literature and art form two branches of study in a great degree distinct from each other, although literature is, of course, an essential portion of every branch of study.

1873. Are you well acquainted with the management of the British Museum?—Not well, but generally.

1874. What do you think of the expediency of making appointments under the heads of departments, without any consultation with the head of the department?—It would be, in most instances, desirable that the officer in charge of the department should be consulted on such occasions.

1875. Suppose the whole manual labour in arranging and labelling a collection should fall entirely upon an individual supposed to be capable not only of taking charge of the collection, but of arranging and naming it himself, do you think that a system that ought to continue?—My opinion of the propriety of its continuance would depend in a great measure on the extent of the department; if the department was not of greater extent than the officer would have full time to attend to, as well with regard to naming as to fixing the labels and to arranging the specimens, it would be unnecessary to have a second person employed to do that which one could accomplish.

1876. Take the Entomological department; take the case of Mr. Samouelle, who has stated in his evidence that he is obliged to label and arrange the collection entirely,

entirely, do you think such an individual as Mr. Samouelle could not be more beneficially employed in the Museum than in arranging and labelling the collection; speaking always of the mechanical part of that duty?—The time during which Mr. Samouelle is employed is, in my estimation, adequate to the entire charge of the collection, to doing for the collection under his care all that it requires, comprehending, among other duties, the setting and labelling the specimens.

1877. Take the case of the Mineralogical department, that of Mr. König, he having told us that he has to write every label with his own hand; do you think that a man of Mr. König's standing should be so employed?—The writing of the actual label to be attached to the specimens might perhaps be done by a clerk. Mr. König's department is so extensive that it appears to me that it might be useful to afford him aid, if he required it, for the writing of the labels to be attached to the specimens exhibited.

1878. Lord *Stanley*.] Who arranges and labels the specimens in the Zoological Society's Museum; is not that done by the curators?—That is done by the curators of the several departments.

1879. Mr. *Hawes*.] Have they no mechanical assistance?—At present they have not.

1880. Why should they not give them further assistance?—They are about to have further assistance, in order that they may have more time at their disposal to get on with the naming more rapidly.

1881. And therefore you think it expedient to relieve the curator of some portion of the labour that devolves on him at the British Museum?—Yes.

1882. Sir *R. Inglis*.] But so far as hitherto they have been labelled by the individual labour of the curator?—Yes; I should state, however, on this point, that it is very generally thought that a label written by the hand of a known competent authority is more valuable than a copy of that label written by a clerk; that the autograph name affixed to the specimen by a competent authority gives to that specimen additional value in a scientific point of view.

1883. Mr. *Colborne*.] Are you more behind in the Zoological Society than you are in the British Museum?—At present we are.

1884. That is the reason why you require this additional assistance?—It is one of the reasons; our establishment has hitherto been too small for the number of objects possessed by the Society.

1885. Mr. *Hawes*.] Do you think it a good system to pay literary men by the day, in order that the institution may be relieved of the incumbrance of their employ when the necessity for it ceases?—The question refers to a subject on which I am very little competent to speak; I presume it would not be a gratifying thing to gentlemen employed in common with others who are paid in a different way.

1886. Sir *R. Inglis*.] Do you know that it has ever been a subject of complaint amongst the gentlemen so employed?—I have heard of an instance in which a remark has been made on the subject.

1887. Have you reason to believe that there has been any difficulty in finding competent assistance, upon the plan indicated in the last question?—I am not aware that there has; I believe, in fact, that at the time that the classed catalogue was in progress, the gentlemen who were employed in the several departments of that work were all of them highly respectable, and some even eminent in their departments; and I believe their mode of remuneration was precisely that which has been referred to, that of a fixed rate of payment per day.

1888. Mr. *Hawes*.] Now with regard to the shells; you have stated in your former evidence that the collection was extensive, and was extensively named; Mr. König in his evidence has stated that a great portion of the shells are without name and arrangement; will you reconcile your statement with the statement of the keeper of the Natural History department?—Mr. König's evidence probably refers to a time different from the present.

1889. Why do you suppose so?—I believe that he was examined last year.

1890. Your evidence, then, is given as to the collection at the present moment?—Yes.

1891. Has there been a great improvement in the last year in the arrangement and naming the collection?—It has been in process of arrangement and naming for some years; in fact, ever since it has been in the room in which it is now placed, it has been in process of arrangement, as time could be devoted to it.

Mr. *E. T. Bennett.*

19 April 1836.

1892. The only mode of reconciling the discrepancy, is by supposing that you speak at different times?—That appears to me the most simple mode.

1893. Supposing there to be no material change in the collection, are you disposed at all to doubt the accuracy of the keeper of the department?—I ought not to doubt the accuracy of his statement.

1894. Is it not much more likely to be more accurate than your own?—I should rely on Mr. König's accuracy at the time he was giving information to the Committee; at the present moment my impression is, as I have stated to the Committee, that the shells are very generally arranged.

1895. Supposing Mr. König to be accurate at the time, it must follow that within the last year there was a great improvement?—Yes.

1896. Sir *R. Inglis.*] Were you in the Museum in the month of July of last year?—I probably may have been.

1897. Was the arrangement in progress at that time?—The arrangement has been in progress ever since the change of rooms, ever since more rooms were given to the Natural History department. The arrangement may be looked upon as constantly in progress.

1898. The arrangement and naming of the shells has continued from the time you first visited the Museum to the present?—It has.

1899. *Chairman.*] I think you say Mr. König is more likely to be accurate than yourself?—As the head of the department he would be likely to have accurate knowledge of it.

1900. Have you any fact that comes within your own knowledge to state to the Committee, from which you draw that inference, that he is more likely to be accurate than yourself?—I assume, from his being more intimately connected with the collection than myself, that he should be better acquainted with its details than I am, who have merely inspected it.

1901. Then if I understand you rightly, you have no fact from whence you draw the inference, and no means of coming to that conclusion, other than that which every Member of the Committee possesses intimately to itself?—No.

1902. Mr. *Hawes.*] Are you acquainted with the Synopsis of the Museum?—I have seen it.

1903. What is your opinion of it?—That it is a useful Synopsis of the contents of the Museum, to be put into the hands of visitors of ordinary acquirements.

1904. Perhaps it is adapted to visitors of very ordinary capacity?—No, I do not regard it as adapted for an inferior class of persons; there are parts of it which give a general sketch of the systematic arrangement of those departments of natural history that are contained in certain rooms; these would be useful to persons making themselves acquainted, not minutely, but generally, with the subjects treated of.

1905. Do you think it worthy of the officers of the Museum?—I think, generally speaking, it is so.

1906. You think it more a popular than a scientific work?—Yes; but giving such a sketch of the scientific arrangement as may be useful to those who are desirous of acquiring the first rudiments of science.

1907. Is it estimated much in the scientific world, even as a useful compendium of the Museum?—I am not aware that it is. To the scientific student it would be of little use, except as a guide to the general disposition of the objects.

1908. Have you carefully looked at it yourself?—I have looked through that part of it which relates to the fishes, and I have there seen an outline of Cuvier's system.

1909. Are you aware that parts of it are mere translations of Cuvier's works?—I am aware that portions of it are translated or abridged from him.

1910. What part do you refer to, what passages?—To one particularly, that with reference to the lophius.

1911. What led you to refer to that?—My attention was directed to it in consequence of something that occurred here last year.

1912. Will you state what that was, in consequence of which you had your attention directed to this last year?—There are several lines in the Synopsis on the subject of the lophius, which are translated and abridged from the "Règne Animal."

1913. Do you, as a naturalist, concur in the description?—Yes.

1914. You do distinctly?—Yes.

1915. You are aware that Mr. South has stated that he entertains a different opinion?—Perhaps I had better refer to the words of the Synopsis. I will not now

now venture to say whether the mouth is surrounded by long filamentous processes or tentacula. That there are filamentous processes or tentacula of moderate length about the mouth is certain; but I will not say, without reference to a specimen, whether they exist on the upper jaw as well as the lower. The Synopsis does not in this place advert to the long filaments on the head, which is rather an error of omission than of description.

1916. Sir *P. Egerton.*] Are you aware of the passage that follows; if so, do you think it describes with sufficient clearness the characters which are so strongly marked in the lophius piscatorius?—The passage that follows describes the chironectes, and adverts to the fishing filaments, as they are generally considered, of the lophius. I do not remember that the use there assigned to the long rays on the head has been previously attributed to those processes in the genus chironectes.

1917. Mr. *Hawes.*] Do you think it desirable to improve the Synopsis at all, or not?—The Synopsis must be made to improve progressively with the collection.

1918. But on the present plan and system?—On a plan and system nearly the same as the present, but admitting of more development.

1919. But it is not susceptible of great improvement?—Adopting the plan hitherto pursued by the officers of the department, that of following some accepted authority, it is not, generally speaking, capable of much improvement, except as admitting of more development; the interpolation of fresh matter as fresh materials are introduced, and the correction of such statements as may be found to be erroneous.

1920. Suppose the collection of the Museum to remain in its present state, are you of opinion that the Synopsis is not susceptible of very great improvement; as a publication, could it not be made more useful to the public or not?—It might be made more useful by entering more fully into the distinctive characters of the several larger groups.

1921. You confine your opinion to the Natural History department?—Yes.

1922. Your opinion does not extend beyond that at all?—No.

1923. Are you aware the scientific names of the specimens in the Museum are generally given in the Synopsis, the generic names?—The generic names appear to be very generally given.

1924. So that persons anxious for information would be able to refer to the descriptions given in the scientific works of the day for these specimens?—Yes.

1925. And the text generally, do you think it gives a popular and familiar description of the specimens in the Museum?—Yes, a popular sketch of the arrangement pursued.

1926. Therefore it combines the two objects of affording an interesting description to the generality of visitors, and there is also given an opportunity to the more scientific visitors of referring to the published descriptions in the scientific works of the day?—Yes, generally.

1927. You speak from an accurate examination of the Synopsis?—From a general examination. It is not a book of science; not a book that one is under the necessity of studying, so as to be enabled to answer respecting it very accurately on the moment.

1928. Sir *Robert Inglis.*] With reference to the observation you made at the commencement of your examination to-day, as to the benefit derived to science from the French collection and from that in the British Museum, can you state to the Committee how long the collection in the Jardin des Plantes has existed?—It has existed in activity for more than 40 years; I mean in its more modern state of activity. There was, in the days of Buffon, a fine collection for the period; and there was also an extensive cabinet of comparative anatomy; but I conclude, from the statements made by M. Geoffroy St. Hilaire, that the collections had been very considerably reduced prior to the re-organization of the museum in 1793.

1929. In point of fact, do you not know from the later history of France that the collection in Paris existed a century ago?—I do not know how long it has existed; but the present collections of mammalia and birds, at least, can scarcely be dated farther back than 1793.

1930. Mr. *Colborne.*] With reference to the former part of your examination, pray what number of Trustees would you recommend as a board?—For the Natural History museum alone?

1931. The natural history alone.—It is probable that such a board as I have contemplated would amount to 20 or 25, perhaps eventually to 30 persons.

Mr. *B. T. Bennett.*

19 April 1836.

1932. If they all attended, would they not encumber each other?—A large number is certainly inconvenient for the transaction of business.

1933. Then why do you think such a number as that would be at all necessary?—They would probably not have much business to transact as a board; and I have been anxious to connect with the Natural History museum official persons, capable of aiding the objects of the institution. Their connexion with it would, perhaps, rather be an honorary distinction than a claim upon them for frequent attendance.

1934. Mr. *Hawes.*] What is your opinion of the expediency of forming an accurate catalogue of the specimens of the Natural History department?—It is very desirable.

1935. Is it not essential to give the greatest possible completeness to that collection?—After its completion it would save much time to the officers, and would undoubtedly be very useful.

1936. Next to the possession of a good collection, the formation of an accurate catalogue must be deemed an improvement?—Undoubtedly.

1937. Lord *Stanley.*] I think you stated, with reference to the formation of a catalogue, that you had no catalogue of the collection of the Zoological Society?—No good catalogue.

1938. And you conceive that the same reasons which have hitherto prevented the making a good or perfect catalogue for the Zoological Society continue up to the present time, and furnish sufficient reason why there should not be a catalogue of the Natural History department of the British Museum?—Yes; the principal of those reasons being, I apprehend, the want of sufficient assistance.

Mr. *John Turner*, called in; and further Examined.

Mr. *John Turner.*

1939. Sir *Robert Inglis.*] HAVE you an establishment for the sale of shells in other places as well as in London?—Yes; at the present time in Glasgow; during the summer season at Margate. I have an agent at Hamburgh and another at Paris, for the sale of objects of natural history.

1940. Do you make visits regularly to the Continent?—Frequently; it may be three or four visits in the course of a twelvemonth.

1941. For the purpose of exchange?—Selling, exchanging and purchasing shells, animals, and other objects of natural history.

1942. And in this way you have a general knowledge of the different Continental collections?—Yes.

1943. Can you state whether the collection of marsupial animals in the British Museum is or not superior to that in the Paris Museum?—Yes, to any other collection I know.

1944. Including that in the Paris Museum?—Yes, to any Continental museums.

1945. Have you ever communicated on the subject with the professors of the Paris Museum?—Yes, and they have at all times manifested a great desire and anxiety to obtain specimens of marsupial animals.

1946. Have they given you, in your character as dealer, power to collect for them?—I have now commissions from them to procure all the marsupial animals I can.

1947. At this moment the collection of marsupial animals in the Jardin des Plantes is greatly inferior to the collection in the British Museum?—Very inferior; I do not think in the Paris collection they have one quarter of the number of species of marsupial animals that there are in the British Museum.

1948. Can you state to the Committee what is the relative value of the collection of fossil saurian animals?—The fossil saurian remains in the British Museum are the finest collection I know existing anywhere; very far before that of Paris.

1949. Do you know whether the Paris Museum has any synopsis of its contents?—They have the work of Deleuze, published some years since, a work in two volumes, with engravings; but it is not made use of as a work of reference to the collection.

1950. Have you ever seen any synopsis in the hands of the visitors at the Paris Museum?—Never; I have never seen that work of Deleuze made use of by visitors.

1951. And the professors have not thought it necessary to provide for the visitors

visitors there, anything approaching to the Synopsis of the British Museum?—Nothing.

1952. Have you heard people complain generally of the Synopsis of the British Museum?—I never heard any complaint of the Synopsis of the British Museum.

1953. With respect to the shells in the Museum, compared with the shells in the Paris collection, are they more or less named; is a larger or smaller proportion of the shells named?—I think I gave in evidence on my last examination, that the number of shells named in the British Museum is greater than those named in the Paris collection.

1954. Comparing the state of the British Museum a year ago with its present state, is progress making, and has progress been made, in naming the collection?—Yes, great progress.

1955. Can you state to the Committee anything with respect to the mode either of stuffing or of preparing birds in the Paris collection?—I know that it is a common method adopted by the stuffers of birds to transfer feathers from one bird to another; wings from one bird and the tail from another. If you will allow me, I will relate an instance that occurred in November last. I had a transaction with a person who holds a situation in the bird-stuffing department in Paris. I had some Argus pheasants for sale, and I sold them to him, and he stated at the time that they were imperfect specimens, and that from eight he should only be able to make four perfect birds. He said he must remove the wings from one bird and put them on another, and that he must do so with the tails.

1956. If the specimens in Paris appear to a casual spectator to be in a state more brilliant and perfect than those in the British Museum, it is not necessarily to be inferred that the specimens are scientifically more perfect, inasmuch as they are made up by a process similar to that which you have described?—It may be the case; I am not prepared to say that the same system is not adopted in the British Museum that I tell you is adopted in Paris. I know that it is done in Paris; I cannot say it is not done here; I have not the means of knowing.

1957. With respect to the value of nomenclature on objects of natural history, did you in your profession ever know a very rare shell become worth a large sum because it was named?—I never heard of any instance of the kind; I think there is no additional money value given in naming shells; that, if anything, the reverse is the case. I speak as a dealer. If I obtain a shell that is not described, consequently it has no name, and persons are the more anxious to purchase that specimen undescribed, without a name, that they may be able to give it any name they think fit.

1958. Do you consider that the names of the objects of natural history relating to shells in the British Museum are received as authority in this country and the Continent?—In London we have no other public collection but that in the British Museum. I frequently hear persons referring to names in the British Museum, and I have frequently seen small collections of shells named from specimens in the British Museum; I have asked where they have obtained those names, and they say from the British Museum.

1959. Can you name a collection?—That of Mr. Pratt of Bath, Miss Saul, and many other eminent collectors.

1960. Do you know Dr. Beck?—Yes.

1961. Did he come to London with a view to any examination of the nomenclature?—Yes; one object of his visit was to compare the specimens which had been described in the recent publications on shells with the specimens in the British Museum, and in the collection of Mr. Gray, and other collections.

1962. Particularly with Mr. Gray's?—Yes.

1963. Mr. *Hawes.*] I did not understand your last answer?—One of the chief objects of his visit to this country was to compare the existing shells in the British Museum with the descriptions published of them; and he also named to me the collection of Mr. Gray, in which many of the shells recently published existed, and in no other collection.

1964. To what publication do you refer?—To a variety of publications.

1965. Name them?—The "Proceedings of the Zoological Society," for one; I may state the article on Cyprædeæ, that appeared in the "Zoological Journal" seven or nine years ago.

1966. You stated that Dr. Beck came to examine the nomenclature adopted in the Museum?—I do not wish to make it appear that Dr. Beck came solely to examine the shells in the British Museum.

Mr. *John Turner.*

19 April 1836.

1967. Lord *Stanley.*] Was not one main object of Dr. Beck's visit to compare the specimens in the British Museum with the names which had been given to them by Mr Gray?—Certainly.

1968. So far as that goes, therefore, the object of Dr. Beck's coming to this country was to examine the nomenclature of the British Museum, which he considered as an authority?—Yes; it was not his sole object; it was one of the number of objects that he had in view.

1969. Mr. *Hawes.*] Did Dr. Beck visit your shop?—Yes.

1970. Are you accustomed to give names to particular shells?—No; I find that I can sell them better without a name than with one; I speak as a dealer; I am here to give evidence of an amateur.

1971. Sir *Robert Inglis.*] Have you experienced all the facility you desire, or otherwise, in consulting the collections of the British Museum?—At all times.

1972. From the regulations of the institution, and from the courtesy of the curators, one or both?—From both.

1973. Have you frequently had occasion to make those references?—Repeatedly; continually.

1974. You stated in your last examination that the Leyden collection was specially rich in the products of those countries with which Holland has the chief if not the exclusive intercourse?—I did.

1975. Can you state whether the collection in the British Museum be or be not composed of specimens generally from every quarter of the world?—Yes, certainly.

1976. Have you ever heard anybody complain in this country or on the Continent on consulting the collections or visiting the collections of the British Museum?—Never.

1977. Dr. Beck is no longer in this country now?—No.

1978. Have you ever heard Dr. Beck give an opinion as to the state of the British Museum at present?—No.

1979. On no point connected with the British Museum?—I have heard him speak of the British Museum as a collection, as being a very good collection, and that in the course of a few years it would be the first in Europe; at the present time, his words were, it was a very respectable collection.

1980. It being a collection in progress?—Yes.

1981. Do you know the state of the rooms in the Jardin des Plantes in which the remains of fish and reptiles are exhibited?—Yes; I know them very well.

1982. Are any specimens placed above the reach of ordinary eyes?—Yes; many cases are, I think, nine feet in height.

1983. Must not that be the case in almost every collection?—It is in almost all collections.

1984. That some specimens must be placed in situations not so favourable as others for the observation of the casual spectator?—Much room must be lost if it is not so.

Mr. *William Yarrell,* called in; and Examined.

Mr. *Wm. Yarrell.*

1985. Sir *Robert Inglis.*] YOU are the author of various papers in zoological journals, and you are the author of a distinct work, the value of which is well known, on British Fishes?—Yes.

1986. How long have you known the British Museum?—Fifteen years, or rather more.

1987. Can you favour the Committee with your opinion of its comparative state now and then?—The zoological collection, to which I speak more particularly, has very much increased. At the time I knew it first it was contained, I think, in two rooms only; it now occupies six rooms, three of which are large.

1988. Your examination will have reference to the Zoological department entirely; with that explanation, will you continue the answers which you have commenced, and state the comparative extent of any one division of the Zoological department at the present time, as compared with its state when you first knew the Museum?—If I recollect rightly, the British birds were formerly confined to one small room, that which is now occupied by Mr. Gray as a study, and the mammalia were on brackets in the higher parts of that same room; but, attending more particularly to vertebrate animals, I cannot speak positively to the contents of the second room.

1989. Has the increase been progressive from the time when you first knew the Museum,

Museum, or has it been more rapid since the space appropriated to the collection has been increased by the erection of the new building?—My impression is that it has been rapid in proportion to the space devoted to it; as new rooms have been added, they appear to me to have been very quickly filled with subjects.

1990. The inference, then, that you wish us to draw would probably be that the previous state of the Museum was owing to the want of space to receive and exhibit any increase of the collection?—That is my opinion.

1991. It is the view which you yourself have independently taken of the state of the collection?—Yes.

1992. Will you state to the Committee your views as to the arrangement, whether it be competent or not, of the existing collection in the Museum, speaking still of the Zoological department?—I think the arrangement good, and useful as far as it goes.

1993. Can you state to the Committee what nomenclature is adopted, for instance, with respect to British birds?—The British birds have lately been labelled according to the nomenclature of the manual written by the Rev. Mr. Jenyns.

1994. You consider that to be sufficient authority?—I consider Mr. Jenyns good authority in British birds.

1995. Do you consider the authority of Mr. Jenyns to be such as to justify, by his authority, the naming of the national collection?—I think it is, when confined to British birds, for this reason, Mr. Jenyns includes, in the synonymes in his work, the names used by authors of authority before him.

1996. With respect to foreign birds whose nomenclature is adopted; what, in your judgment, is the value of such nomenclature, or the authority on which it rests?—In the *general* collection of birds, the nomenclature is that of M. Temminck, and I think him a good authority; he is probably one of the best ornithologists in Europe.

1997. Will you state to the Committee what facilities of consultation, if any, you yourself personally have experienced in the British Museum, and whether they were good and sufficient?—I have invariably received the greatest attention and assistance whenever I have gone there, whether to consult or compare specimens or books, or both.

1998. Do such facilities arise from the regulations of the Museum or from the courtesy of the individual officers, or from both?—At the time I was first in the habit of going to the Museum I was a stranger. I believe the facilities I experienced then to have arisen from the regulations of the establishment; perhaps latterly to some acquaintance with the gentlemen of the Zoological department.

1999. Now when you were a stranger, you found such facilities of consultation as you desired?—Yes.

2000. Can you favour us with any numerical view of the progress made in the different collections in the Zoological department during the period for which you are a witness, in respect to the Museum?—Very little, beyond that which may be inferred from the space now occupied. I may explain this by saying, that my leisure is limited. Natural history is the subject pursued during my leisure, and I direct my attention more particularly to the zoological productions of this country.

2001. Lord *Stanley.*] With reference to the specimens of fishes preserved in spirits, in what state are they?—Generally speaking, in as good state as fishes can be preserved in spirits.

2002. Have you noticed any indication of want of attention on the part of the officers to the preservation of the specimens, and the consequent deterioration in their condition?—No, certainly not; but in reference to their appearance, I may state that it is impossible to preserve the muscular and other soft parts of fishes in spirits without having it sufficiently strong to abstract part of their colour, and that is one reason why fishes in glass vessels may not have that perfect appearance to popular eyes which they might be expected to possess.

2003. But for scientific purposes, do you consider there has been proper attention paid to those specimens which we have?—I consider so, certainly, those which I have had occasion to examine.

2004. The collection of fishes is not a large one?—It is not a large one.

2005. Sir *Robert Inglis.*] Are there among it many valuable specimens which have been of use to you in a scientific point of view, for the purpose of consultation and examination?—I have had occasion several times to examine them, because the British Museum possesses all the fish collected by Colonel Montagu on the Devonshire coast, and a very considerable portion of the fish that Mr. Donovan possessed.

Mr. *Wm. Yarrell.*

19 April 1836.

possessed. I have reason to believe, from the extent of Colonel Montagu's manuscripts, which I have seen, that he contemplated a History of British Fishes, and had collected largely for that purpose. Mr. Donovan's History of British Fishes is before the world.

2006. Are the fish classified and named together?—They are to a considerable extent named; I should think all the British ones are named.

2007. Have you had any reason to find fault with the classification or the nomenclature of the specimens which have been named?—No reason to find fault; they are as well exposed also, perhaps, as such subjects can be; there is difficulty in arranging the subjects of a genus where some are large and some small; they can scarcely be brought to look well.

2008. Can you find any error or want of science in the names which are attached?—As far as I am acquainted with the subject, they bear the names by which they are known.

2009. They bear the names given to them by persons of the highest authority?—Certainly.

2010. While we are on the subject of names, will you allow me to ask you whether the term "swimming bladder," as applied to the air bladder of fish, is an imperfect expression?—No; on the contrary, I think it is a proper expression; it describes its physiological use, and it is so called by most of those writers who would be considered as authorities. Willughby speaks of it as "vesica qua natat;" Lacepede and Cuvier speak of it as "la vessie natatoire;" Monsieur Valencienne, in the 10th volume, "Histoire des Poissons," lately published, which was more immediately his own production, speaks of it as a swimming bladder; M. Agassiz, one of the best Continental authorities on fishes, in the only English communication I am aware of in which he had occasion to name the part (in a communication to the Zoological Society, which will be found in the Proceedings of 1834), calls it a swimming bladder.

2011. I believe you use the same term in your own work?—I have frequently used the same term.

2012. Have you had your attention called to the description given in the Synopsis of the British Museum of the lophius piscatorius?—Not particularly; I am generally acquainted with that part of the Synopsis that refers to natural history.

2013. Will you have the kindness to look at that description, and state whether you consider it to be incorrect in point of fact, or objectionable as inserted in a work of the character of that Synopsis?—I think the tentacula are rather on the top of the head than round the lip. That part which refers to the first ray of the fin or longest filament, is correct.

2014. Mr. *Hawes.*] Will you refer to question 1161, in the evidence of Mr. South; read the answer to the question, and state your opinion on it?—It appears to me that both may be considered to a certain extent correct; the filaments or tentacula, whether about the lips or on the top of the head, from whence they are brought down in front, are delicate organs of touch, by which the fish obtains cognizance of the presence of food; the longer ones give him only a greater range of contact. There are instances of other fish which have long and short tentacula, by which they obtain an increased range of contact.

2015. Sir *P. Egerton.*] You have alluded to a communication that was made by Monsieur Agassiz to the Zoological Society; what was the subject of that communication?—Two species of the genus lepisosteus in the British Museum.

2016. Were they new species?—He brought them under the notice of the meeting, considering them two new species.

2017. Then he appears to have had every facility afforded to him of consulting specimens in the British Museum?—I believe he had.

2018. Of course he would not be able to ascertain the specific difference accurately, unless he had every opportunity afforded him of a close examination of the specimens?—I have no doubt that he did closely examine, taking them out of the spirits and comparing them with others, and so on.

2019. Sir *Robert Inglis.*] He being a stranger, had every facility as a man of science which he could have desired in any museum in any country in the world?—I believe so; and from the nature of his communication, I believe he was allowed even to open and inspect the internal structure.

2020. Mr. *Hawes.*] Are you, as a scientific man, generally satisfied with the state of the collection in the British Museum; I refer to the Zoological collection,

of

of course?—I should say it is not such a collection as an Englishman, fond of natural history, would wish to see as "the national collection of this country;" but it still may be as good a collection as the means appropriated can produce.

2021. But it is capable of great improvement and extension?—No doubt of it.

2022. Lord *Stanley.*] Is it capable of extension, in your mind, with reference to the present space?—Not capable.

2023. Sir *P. Egerton.*] Are you acquainted with any museum now in existence that is not capable of extension?—No.

2024. Mr. *Hawes.*] Are you acquainted at all with the constitution of the present Museum?—I confess not with the number or names of the Trustees.

2025. Do you think such an institution as the British Museum might be made in any way useful, either as a means of conferring honour or reward on scientific men?—Yes.

2026. Suppose the trusteeship of the British Museum were conferred more frequently on eminent scientific individuals, do you think that the Museum, speaking generally, or the zoological collection in particular, would suffer from the greater accession of science in the board of Trustees?—No, I should think it would not suffer.

2027. Do you think it desirable to add a certain portion of scientific Trustees to the board of management?—May I ask what is the number of the present Trustees?

2028. Forty-eight?—I should think 48 quite sufficient.

2029. Suppose a large portion of them consisted of official men, whose whole time was necessarily devoted to the discharge of their official duties; do you think those men best capable of directing the affairs of an institution like that of the British Museum?—A part of the business might be carried on without them; they might be exceedingly useful occasionally.

2030. Useful as public men, or useful as Trustees and Directors of the Museum?—Useful as Trustees generally, and as public men having great influence in certain quarters, which influence might be called into advantageous operation.

2031. Do you think a functionary so high as the Lord Chancellor likely to be of much use as a Trustee?—I think the Lord Chancellor ought to be a Trustee of the national collection.

2032. State why?—*Ex officio*, from those talents that man must be presumed to possess who becomes the Lord Chancellor of this country.

2033. What duties do you conceive properly belong to a Trustee of the British Museum?—Generally to extend its usefulness.

2034. Do you think the Lord Chancellor has much time to think on that subject?—He may not have much time to think upon it, but he will be a very powerful agent when called upon.

2035. Do you think the Prime Minister is likely to be able to devote much time to the interests of the Museum?—He would probably not be able to devote much time, but his influence and power would be of great use.

2036. Might not a board, containing many more scientific men, to the exclusion of those high functionaries, have equal influence with them in improving the collection?—I am not aware it would; such a board might have the knowledge and the will, but not the power.

2037. Sir *Robert Inglis.*] You regard a board of Trustees as superintending instead of directing the details?—Precisely.

2038. Lord *Stanley.*] Should you not think it advantageous on many occasions to have the personal assistance and attendance of the Chancellor of the Exchequer, with a view to the improvement of the Museum?—I think it a very material point.

2039. Mr. *Hawes.*] Do you think him less likely to listen to such applications if he was not a Trustee?—I think he would be more ready to be useful if he were a Trustee.

2040. Sir *Philip Egerton.*] Do you not think that in a great national collection, supported almost entirely at the public expense, the public in general require some guarantee that the interests of that institution are properly taken care of?—I think they do.

2041. Can you conceive a better guarantee than the arrangement under which those functionaries who hold the highest offices of the State are Trustees *ex-officio* of the British Museum?—I think it is properly in their hands.

2042. They are persons generally well known to the public at large, when, perhaps,

Mr. *Wm. Yarrell.*

19 April 1836.

haps, scientific men of the day are not so intimately known?—Scientific men of the day would not, I think, have the weight with the people, with the million, that a high public functionary has.

2043. Mr. *Hawes.*] Are you acquainted with the officers of the Museum generally?—Not generally.

2044. Are you aware of their remuneration and duty?—I am not aware of them generally. I have read the evidence, at some distant time, and seen it lately, but I do not carry it in my memory.

2045. Do you think the most eminent men of science are generally selected for the offices there, and that the remuneration is such as to attract them?—I think it is; I think if an office were declared vacant, there would be, I have no doubt, a large number of applicants.

2046. Do you think the remuneration adequate, and that it is sufficient to obtain the first talent in the country?—In the higher offices I think it would.

2047. Have you ever seen any catalogue of the Zoological collection of the British Museum?—No, I have not.

2048. Have you visited that collection frequently to examine its contents?—No, not very frequently; I know something like the number of specimens, but not particularly; I confine my natural history inquiries to the productions of my own country.

2049. When you went to the British Museum, you never had any catalogue shown to you?—I do not remember any catalogue, but a Synopsis I possess.

2050. Is the Synopsis a publication satisfactory to you as a scientific man?—I apprehend it was not written for scientific men.

2051. Is it satisfactory to you as a popular description of the contents of the Museum?—It is.

2052. Is the arrangement in it satisfactory and clear to you?—Yes, as far as it goes.

2053. Is the collection in the British Museum held in such scientific estimation as to possess a European reputation?—I am not sufficiently acquainted with opinions abroad to answer the question.

2054. But speaking from the opinions of naturalists and others, from personal acquaintance on their published works, do you find such an opinion entertained of the Zoological collection of the British Museum as to entitle it to a reputation which may be styled an European reputation?—That nationality which pervades will generally prevent Continental authors from quoting a British collection or authority, except in the case of unique specimens. They will refer to specimens or authorities more immediately in their own neighbourhood.

2055. But the same nationality will lead British authors to exalt the reputation of the British Museum?—I think it would.

2056. Will you refer to the work of any distinguished naturalist, who holds up the collection in the British Museum as one that has advanced science?—I apprehend that there are specimens in the British Museum which are nowhere else to be seen.

2057. I speak of the whole, whether there is any work which has held up and referred to the Zoological collection in the British Museum as one highly honourable to the state of science at the present moment?—No, I am not sure that I can.

2058. Should you, as a scientific man, object to the addition of a greater number of scientific men to the board of Trustees?—No.

2059. Supposing such an addition to take place, do you think the Zoological collection would be more rapidly improved and more beneficially extended than it is?—I think it is likely that it would, because such Trustees would endeavour to advance, so far as their influence went, that particular branch.

2060. Sir *Robert Inglis.*] Does that answer imply that each division and department of Zoology should have a corresponding representative among the Trustees?—I think there should be some Trustees who are eminent as naturalists, or who are zealous for the promotion of natural history.

2061. Lord *Stanley.*] Have you ever maturely considered the question of the proper constitution of the trust of the British Museum, or are you giving merely off-hand answers to the questions that are put?—Rather off-hand answers; but, as Trustees of the British Museum, I think there should be one or more who took an interest in zoology, as there are antiquarians, literary characters, and others.

2062. Mr. *Hawes.*] Supposing the Trustees of the British Museum to extend the buildings for the accommodation of the collection (of the Zoological collection),

do

do you not think it desirable that the keeper of the Natural History collection and the architect should come in contact, with a view to make the best arrangement for the reception of the collection?—That might depend on how large the portion was to be devoted to natural history.

2063. Do you think the most beneficial use can be made of buildings to be erected, without the keepers of the collections having an opportunity to explain their wants, and without the architect having ascertained the extent of the collection to be exhibited?—They would be desirable points to know; but fine rooms will exhibit natural history, as well as other things.

2064. Are you acquainted with the gallery in which the minerals are exhibited?—Yes.

2065. Do you think that is so well lighted and so well adapted for its purpose as to admit of no improvement, simply with reference to the examination of specimens?—The light appears to me good; it is not, perhaps, the best light; that may depend on adventitious circumstances.

2066. Have you ever been there on a dull day to examine a minute specimen?—No, I do not recollect that I have; the light appears to me generally good.

2067. Sir *Robert Inglis.*] You have been asked whether you thought it expedient that the architect and the curator should come in contact with each other on the subject of the accommodation to be given and received for the Natural History department; do you consider such information as the one might give to the other, might not be equally communicated indirectly, without a personal communication, that is to say, given through the board of Trustees?—Yes; quite as well given by the board of Trustees.

2068. Mr. *Hawes.*] You have stated that the study of the particular branch of natural history, which you have cultivated, is chiefly the pursuit of your leisure hours?—Yes.

2069. Are you in any profession?—A business.

2070. Have you been enabled to visit the Museum frequently, conveniently, during the hours it is now open to the public, conveniently to your own business?—Yes.

2071. Are you enabled to leave your business without inconvenience?—Yes.

2072. Suppose you happened to be of the medical profession, which required the whole of your time during the day, would the hours then be such as you would desire, the hours of opening and exhibiting the collection?—Certainly not; if it were impossible that I could go in the day.

2073. Would you wish, for the sake of professional men and such who are occupied during the day, to make any alteration in the opening of the hours of the Museum, supposing them scientific men?—I should doubt that any one obliged to devote the whole of the day to business would go there as a matter of pleasure in the evening, and I should doubt also the quality of the light for his purpose if he did go.

2074. Do you know Mr. Thomas Bell?—Yes, very well.

2075. He is an eminent naturalist?—Yes.

2076. You are not aware that he has stated that he had no time in the day, and that it would be a great convenience to him, for instance, to visit the Museum by evening?—I was not aware that he had so stated.

2077. Are you aware that the Museum shuts up at four o'clock at Midsummer?—Yes.

2078. You are aware that there are many hours of daylight after four o'clock at that time of the year?—Yes.

2079. And those hours might be used by the public, whose days may be occupied in other pursuits?—Yes.

2080. Would there be any objection to opening the Museum from nine in the morning till twilight?—No objection; it is a matter of money, I apprehend.

2081. Would it be a matter of convenience to the public?—I should think it would.

2082. Lord *Stanley.*] Do you know of any establishment of a similar character to the British Museum, which is open from nine o'clock in the morning till twilight for the admission of general visitors?—I do not.

2083. If it was generally desirable and practicable, public institutions would, of course, have adopted the mode which gave the greatest facility to the public to inspect their collections?—Yes.

2084. But you do not know any case in which the plan recommended by Mr. Hawes has been adopted?—I do not.

Mr. *Wm. Yarrell.*

19 April 1836.

2085. Sir *Robert Inglis.*] The Zoological Museum is a museum open to all the world on an introduction by a Fellow, and the payment of 1 *s.* ?—Yes; but there is a label on the door which states it is only open from eleven to five.

2086. Mr. *Hawes.*] You have stated that the British Museum is very much improved?—The collection has increased greatly since first I was acquainted with it.

2087. And improved?—I consider that increase includes improvement.

2088. Do you think that that improvement has corresponded with the wealth of the country, and the high official influence of the Trustees, on which you have relied so much for extending and improving the collection?—The improvement has been to a certain degree unequal, but it has been much greater within the last three or four years than I had observed previously.

2089. The influence of the official Trustees has extended over the whole period that you have known the Museum?—Yes.

2090. Sir *Robert Inglis.*] But the new buildings have been opened within the last three or four years?—I stated that it was a question of space.

2091. Mr. *Hawes.*] To that alone do you attribute the improvement of late years, the opening of rooms for exhibiting specimens?—Yes, the devoting rooms to them.

2092. Sir *Robert Inglis.*] The imperfect state of the collection when you first knew it arose from the want of space to receive and exhibit?—Yes.

2093. Mr. *Hawes.*] Had you ever occasion to visit the library, with a view to obtain works connected with natural history?—Occasionally; not very often.

2094. Have you ever sought in vain for the work you wanted to find?—No; I do not remember an instance in which I was disappointed.

2095. Did you never find the want of a classed catalogue at the library of the British Museum?—No; my visit in general has been to see some particular book.

2096. The title of which you knew before you went?—Yes.

2097. Supposing you wished to know what particular works existed on a particular subject, would or would not a classed catalogue be of great use to you?—There are books to which the public may refer; there is a classed dictionary, Watts's Bibliotheca.

Edward Griffiths, Esq., called in; and Examined.

Edward Griffiths, Esq.

2098. Sir *Robert Inglis.*] YOU have translated Cuvier's Règne Animal?—I have published an English edition of the Règne Animal, in conjunction with Colonel Hamilton Smith and the late Mr. Pidgeon.

2099. You are yourself a Fellow of the Royal Society and of the Linnæan Society, and a corresponding member of the Natural History Society in Philadelphia, and of other societies?—Yes.

2100. How long have you known the collections of the British Museum; you will recollect, in giving the answer to this question, that the question itself and those that follow will be confined to the Zoological department of that collection?—It must be more than 20 years; I first knew it in the time of the late Dr. Shaw; and I believe he has been dead about 20 years.

2101. Were you acquainted with Dr. Leach?—Yes.

2102. Were you in the habit of frequenting the Museum in his time, and in the time of Dr. Shaw?—Not very frequently, but occasionally.

2103. Are you acquainted with the present officers of the department?—There are two or three of those gentlemen I have the pleasure of knowing personally, the others only by name.

2104. From your personal knowledge of the curators, and from your own inspection, you can state to the Committee generally your view of the state of the Museum 20 years ago, and at present?—It must be in general terms.

2105. In what state was the Museum when you first knew it, as it related either to the number or to the condition, or to the arrangements of the Zoological department; take the specimens?—It is perhaps difficult to speak on such a subject definitely; if I am to speak with reference to the present state of zoology in this country, certainly the condition was most wretched at that time. But if I am to speak of it with reference to the state of zoology in England at that time, the observation must be qualified.

2106. With reference to the then state of zoology, at the time you first knew it in England, the collection bore a near proportion to the state of science at that time?—Yes, certainly.

2107. As the state of science has advanced, the collection has advanced progressively with it?—I consider it has, certainly.

2108. Mr. *Hawes.*] Do you mean to say that the collection has advanced progressively and equally with science in England?—Yes, it has advanced progressively since the time of Dr. Leach. I think he first gave the impulse of improvement to the Zoological department of the Museum.

2109. Sir *Robert Inglis.*] Can you state what was the extent occupied by the Natural History department at the time when you first knew it, comparing the space occupied by the same department at the present day?—No; I could not venture to do that.

2110. Take the mammalia?—The collection of mammalia has always been very bad, and is so at the present moment; still it is much better than it was when I first knew the Museum. I think there must be approaching to a thousand species of mammalia described by different authors, and I do not suppose there can be more than one-third, possibly not so many, in the Museum. I stated before that my answers must be general, not having had an opportunity of making any calculation or close observation.

2111. Of the other vertebrata, can you state to the Committee what was the condition, and what is the condition at present?—The birds especially are highly improved as to number and condition; the state of the reptiles is also very much improved; the increase in the number of birds must be very great indeed.

2112. Mr. *Hawes.*] Speaking of both, with respect to the present state of science?—With respect to the present state of science, I should hesitate; certainly it is not altogether what it ought to be. But with reference to the former state of the Museum in the time I speak of, 20 years ago, its condition is very highly improved.

2113. Do you attribute the state of the zoological collection 20 years ago in a great degree to the corresponding condition of the science in England at the time?—Indeed I should think so; zoology was utterly neglected; 20 years ago it was anything but popular; certainly there were very few amateurs that paid much attention to it.

2114. Now with the increase of popular taste and popular knowledge there has been a corresponding disposition to raise the collection?—Certainly there has.

2115. Within the last few years there has been a considerable increase to the collection itself?—A very large increase indeed.

2116. Can you state how far, in your judgment, the defective state of the collection, at the period to which you advert, can be or not attributable to the want of space at that time to have exhibited the collection, whatever might have been the state of science at the time?—I should much doubt its arising entirely from want of space.

2117. How far, that is the question?—I should think perhaps not to a great extent; I should think it was much more attributable to the state of zoology in the country. I am able to say that there are many parts of the rooms in the Museum now occupied by the zoological collection which were not so occupied at the time I spoke of.

2118. In point of fact, were the rooms of the Museum 20 years ago, at the period to which you refer, filled or not filled?—Not filled; and I am of course speaking of the old building only.

2119. You wish the Committee to understand that, in your judgment, Dr. Leach has the eminent credit of having raised the science of zoology in England?—Indeed I think so; his exertions were before the science had gained any popularity here; at least popularity to any extent.

2120. Can you state to the Committee any opinion you may have formed with respect to the nomenclature of Dr. Leach?—It may have been considered too refined; I almost think it was so; but he introduced a taste for nomenclature.

2121. And whether too refined or not, do you consider that Dr. Leach was a man of that eminence in science as to give authority to the nomenclature which he might create or adopt?—I should rather say that he was approaching that eminence.

2122. Can you state in what branches of the collection the Museum is chiefly deficient?—The mammalia much so, certainly.

2123. Can the deficiency in that division be supplied with more or less ease than deficiencies in other divisions might be?—The deficiency in the mammalia might

Edward Griffiths, Esq.

19 April 1836.

might be supplied at almost inconsiderable expense, inasmuch as many of the species wanting are common. Genera are not there.

2124. Mr. *Hawes.*] Do you mean that whole genera are not to be found?—I must correct myself there; unless it be genera including a single or a few species.

2125. Sir *Robert Inglis.*] The space occupied by mammalia is much greater than that occupied by any other?—Yes; from the size of the specimens.

2126. And so far as space might be considered to be insufficient in the former state of the Museum, do you or do you not find in that a reason for the deficiency in that particular division which requires for its exhibition the largest space?—I do not think entirely so, because space was certainly vaacnt at the time.

2127. Do you consider that the specimens are now closely placed?—I think they are, especially the birds; there is hardly an opportunity of examining the generic characters.

2128. Do you know the collection of organic remains in the Museum?—Yes, I do; not very minutely; as a general observer, of course I do.

2129. Will you state what is your opinion of the scientific arrangement of the collection?—It is a question that may admit of much doubt and difficulty; I do not myself think it is advisable to refine too much in systematic arrangement. I think if the large genera of some eminent naturalist, such as Cuvier, be adopted, that the subdivisions will be better left to the observation of students, being pointed out by the synonyma on the labels.

2130. You think the synonymes on the labels would supply the want of an arrangement so eminent and refined as might, under other circumstances, be adopted?—Certainly I do.

2131. Do you mean to say, then, that the specimens are so accurately named?—No, not by any means.

2132. Have you ever examined the specimens in the Museum, with a view to state what proportion are named, and what are unnamed?—I have not had my attention drawn to that, or adverted to it particularly myself; but I am quite sure there are a vast many species not named.

2133. The great fact to which you speak, is the increase of the collection in the year 1836, compared with its state 20 years ago?—That increase is very considerable indeed.

2134. Mr. *Hawes.*] Have you visited the Museum very recently?—I was in the Museum within the last week.

2135. You have visited it frequently?—I have not very frequently.

2136. Did you ever particularly notice the organic remains that have been alluded to?—Not on the occasion of my last visit.

2137. Had you occasion previously to examine them minutely?—No.

2138. Do you remember the specimen that is now in the long room, covered over with green baize?—I am not aware whether it is covered with baize or not; it was.

2139. It is on the floor?—No; the specimen I have in my mind is an ichthyosaurus; it was on the wall.

2140. Do you conceive the collection of the British Museum one possessing an European reputation?—I should say certainly yes.

2141. Do you consider the collection in Paris as superior, in the whole, or inferior?—I must not speak comparatively with reference to the Paris collection and that of our Museum; I never examined them with sufficient care or attention; I have seen it.

2142. I need not ask you whether you are acquainted with the preface to "Griffiths' Introduction to Cuvier's Animal Kingdom?"—Yes; I had almost forgotten it, till I heard it alluded to just now.

2143. In what year was the first volume published?—In 1827.

2144. Were the preface and introduction written last?—No; I think they were written at the close of the first volume, if I mistake not.

2145. Was the introduction written by you or by one of the contributors to the work?—It was written by myself.

2146. Have

2146. Have you once made any reference in illustration of any species, to the British Museum, throughout the book?—Yes, but I could not lay my finger on a particular passage.

2147. How does it happen that in the introduction, whilst you refer to the Paris collection and to French naturalists, you never once allude to the British Museum?—I do not remember that I have; it is a long time since I looked at it.

2148. Are you acquainted with the Synopsis of the Museum?—No.

2149. Are you acquainted with the constitution of the British Museum?—No, excepting generally; I understand it by reputation.

2150. Do men of science at all aspire to the trusteeship as an honour?—I understand they do.

2151. Do many attain it?—I do not know the individuals now, except certain official men.

2152. It would be esteemed an honour among men of science to be the Trustees?—Yes.

2153. Do you think it would give encouragement to scientific men if they were occasionally selected for that honour?—I should think if some portion of the body were men of science, it would be very desirable; I do not think that the whole should be so.

2154. It would not only encourage science generally, but it would lead to the improvement of the collection if a certain portion of the Trustees were men looked up to for their scientific reputation?—I am not aware that it would tend to the increase of the collection of the Museum, presuming, of course, that the present gentlemen take sufficient pains, that the present parties do their duty.

2155. And presuming they are competent to judge of what is wanted?—No; I apprehend they would seek information of men of science where they want it.

2156. Do you think the present Trustees, being men encumbered with great official duties, are likely to promote the objects of the Museum?—I think a portion of the Trustees being influential men very desirable.

2157. But still you would like to see a larger portion of scientific men intermixed with them?—I am not aware of their names at present, but a certain portion I should think, certainly.

2158. Do you think the hours of exhibiting the collection might be beneficially extended or not; they are from ten to four?—If it could be done with convenience and propriety, it might be desirable; but I doubt whether the whole establishment could be kept in sufficient order if the hours were extended; there must be a vast deal of labour when the public is not admitted to keep it in condition.

2159. Have you ever seen or read the catalogue of the zoological collection, or any part of it?—I am not aware of any catalogue in print; I believe the officers have in progress a manuscript catalogue; a catalogue would be very desirable.

2160. Sir *P. Egerton.*] Are you acquainted with the collection of fossil fish?—Partly.

2161. Do you consider they are well exhibited now?—Yes.

2162. Are the names attached to them?—I think they are.

2163. Whose nomenclature is adopted?—I really do not know; I believe it to be that of M. Agassiz.

2164. Sir *Robert Inglis.*] Will you state whether you have found such facilities as you may desire to receive in consulting the British Museum?—When I had occasion to consult the officers or the books, I had every facility.

2165. Did you find every facility for artists drawing specimens?—I never had any difficulty on that subject at all; I had many drawings taken.

2166. Did such facility arise from your friends among the curators or from the general regulation of the institution put in operation by the curators?—I am persuaded that similar facilities would have been afforded to every one.

Jovis, 21° die Aprilis, 1836.

MEMBERS PRESENT.

Mr. T. G. B. Estcourt.	Sir Philip Egerton.
Sir Robert Inglis.	Mr. Bingham Baring.
Mr. Hawes.	Mr. Ridley Colborne.
Mr. Compton.	

MR. T. G. B. ESTCOURT, IN THE CHAIR.

John Richardson, M.D., F.R.S., F.L.S., was called in; and Examined.

John Richardson, M.D., F.R.S., F.L.S.

21 April 1836.

2167. Sir *Robert Inglis.*] YOU are the author of the "Fauna Boreali-Americana"?—Yes.

2168. You formed part of the expedition to the North Pole?—Of both Sir John Franklin's expeditions; I was naturalist to both.

2169. And you have pursued the studies connected with natural history for some time?—I have, since 1819.

2170. Will you state to the Committee your views of the collections in the department of Natural History in the British Museum, as to the extent, arrangement and condition, dividing the department into its usual classes?—I would wish to speak principally to the vertebrated animals, with which I am chiefly conversant; I have no occasion to consult the Museum upon other points. It contains much the largest collection of vertebrated animals, of quadrupeds, birds, fishes and reptiles, of any that I have seen in Great Britain. I have not visited the Continental collections, and therefore cannot compare it with them; but it is the most useful for a naturalist to consult of any in this country.

2171. Mr. *Hawes.*] Does that answer generally apply to the mammalia?—To the birds, the mammalia, the fishes, and the reptiles.

2172. Sir *Robert Inglis.*] Will you state with what collection you compare the collection in the British Museum when you state its superiority?—I compare it with the Edinburgh Museum, the Glasgow Museum, the York Museum, and various museums in London, the Zoological Society's Museum, the India Company's Museum, and the Linnæan Museum.

2173. Do you include the Museum of Comparative Anatomy in the College of Surgeons?—I do not include that, because they are not exactly subjects of comparison.

2174. There is no collection of comparative anatomy in the British Museum?—No; and there is no collection of dried specimens in the College of Surgeons.

2175. And therefore a comparison between the two cannot be instituted?—Not a fair comparison.

2176. Do the answers which you have given apply to the arrangement and condition, or to the extent?—I have answered as to the extent; as to the condition, I should say that the condition of the British Museum is as good as can be expected in a collection of that extent; specimens collected at very various periods and at very different ages. I have known the Museum for sixteen years, and observed its gradual increase, and generally I should say that great care is bestowed in the preservation of the specimens.

2177. Will you state what facilities of consultation you have yourself experienced, and whether such facilities are attributable to the regulations of the institution or to the courtesy of the individual curator, or to both?—As to the facilities that I have received for consulting it, they have been everything I could wish; but I cannot discriminate as to whether it is the regulation of the Museum or the courtesy of the officer, for I have never had any reason to complain in any way.

2178. Have you any reason to suppose that you experienced special indulgence and favour, other than that which men of science generally, pursuing objects of natural history, would have experienced?—I have no reason to suppose so, because I was unknown to the officers when I first went to consult it; I have never met with

with anything otherwise than facility. I have become known to the officers in consequence of consulting it.

2179. Will you state to the Committee the estimate which you have formed, either numerically or generally, as to the state of the collection now as compared with its state in 1819, when you first became acquainted with the Museum?—I cannot speak as to the numbers when I first became acquainted with it. I perceive that there is a great increase of specimens and of species that were not in it in 1819.

2180. Generally speaking, there has been a considerable increase?—A very decided increase.

2181. Has that increase been gradually progressive, or has it made a start at any and at what period in the interval since 1819?—Whether it is owing to the new rooms giving greater facilities for arrangement I cannot say, but there has been apparently a great increase since the building was altered. I suppose that many specimens that they had not room to set up before have now been set up.

2182. In other words, the increase has been contemporaneous with the means of exhibiting the collections?—I should say so, from what I have noticed.

2183. Will you state to the Committee your opinion of the value of the collection in a scientific point of view, looking at any one or all of the departments of Natural History exhibited in the British Museum?—I think any person in London reading upon any department of vertebrated animals, would find it necessary to consult the British Museum. I do not think he could do justice to his subject without consulting it; and he would obtain more information there as to species than in any other museum in England, excluding the osteology and comparative anatomy in general.

2184. Will you state to the Committee your view of the collection of birds in the British Museum?—In most genera and families I think it is by far the most numerous in England; I speak of exhibited specimens, of course, not including the store specimens, whose numbers in the British or other museums I cannot estimate without a list. I do not know anything of the private collections, but it is the most numerous of the public collections in England. There are one or two families in which some collections may excel it, but generally it is by far the most numerous in species. I suppose it contains nearly half the known species of birds.

2185. Mr. *Hawes*.] English or foreign?—Of birds generally.

2186. You are aware that there are two collections in the Museum, one of British birds, and the other of birds generally?—Yes, the British collection is, I believe, very nearly perfect; but I speak as to the number of known species. I suppose there are upwards of 2,000 species in the British Museum, and there are 5,000 or 6,000 known species of birds.

2187. Sir *R. Inglis*.] Will you state your view of the extent and condition of the collection of fishes in the Museum?—It is the only collection that I have seen in England of fishes that is at all useful. There are smaller collections of fishes in bottles in the College of Surgeons and in the Zoological Museum, and a very few in the Museum at York; but there is no Museum in England that contains anything like the number of fish that the British Museum does, nor any collection that is so available to the purposes of science.

2188. Are you prepared to state that they are in a good condition?—Some of them are not in the best condition, but a great many of them are in good condition.

2189. With respect to the reptiles, what is your view of the collection?—The collection of reptiles, I have understood, is the best collection in existence; it is certainly very far superior to any other collection in England, and they are in very good condition.

2190. Are you acquainted with the fossil remains in the British Museum?—Not sufficiently to speak upon them.

2191. Will you favour the Committee with your view of the principle upon which collections in a national museum ought to be arranged, whether to follow the system of any given author, known in the particular department of science, or to create a system from the labours and the science of the individuals intrusted with the separate collections?—I think it is most useful to the student of natural history, or to a writer upon the subject, to have the species arranged according to some author whose works are generally received by the scientific public, such as Cuvier or Temminck, the latter as to birds, and Cuvier as to mammalia and fish.

John Richardson, M.D., F.R.S., F.L.S.

21 April 1836.

The works of these authors must be consulted by every person writing upon those departments, and it facilitates his labour if the specimens are arranged according to their systems.

2192. What would be the effect upon the mind of a student in your own department of natural history, if, on consulting the collections of that particular department in the Museum, with a view to promote his own objects, he should find a new nomenclature and a new arrangement in such department, other than that of the author's hitherto received in the particular class of science?—If he found an unpublished arrangement, there would be a difficulty at the first start as to his knowing how to find the specimens. It would be necessary for him to study that arrangement, and being unpublished, it would be very difficult indeed for him to acquire a knowledge of it.

2193. You consider it desirable that there should be, in the arrangement and nomenclature of a national collection, a chief regard to the received nomenclature and arrangement of some accredited author?—I think it is better, even supposing that the arrangement of the author whose works are generally received is inferior, in a scientific point of view, to the new arrangement; and then the other arrangements may be added to it in the catalogue; but the specimens ought to be arranged so that the student in natural history may look for them in the books he has studied.

2194. Would you consider it desirable that the nomenclature of Linnæus, for instance, should be preserved?—The nomenclature of Linnæus I would preserve, wherever it can be done, but so many new animals have been discovered since his time, that it is no longer available to the full extent. Cuvier preserves all Linnæus's original generic names, giving them in his Règne Animal, either as denominations of genera or of families. Linnæus's specific names ought always to be preserved.

2195. You would preserve the names of Linnæus and his synonymes?—His synonymes or his generic names, which have become names of families; by adopting Cuvier's Règne Animal you have both.

2196. What is your opinion with respect to the introduction of the trivial name as well as the scientific name of the specimen?—I think it is very necessary, particularly in the department which includes the British animals, and it renders it more generally useful to the public. Many of the foreign specimens have no English trivial name.

2197. Do you or do you not consider it inconsistent with the dignity of a scientific collection, to insert the trivial name as well as the classical name of science?—No, I think whatever is useful is not undignified with reference to science.

2198. Admitting that there were space in the label, will you state to the Committee what in your judgment such label should contain, it being assumed that the label of a humming bird is not to be the size of the label of a giraffe or an elephant?—I think they might probably have two labels, a larger label for the specific and generic name of the bird, and in a much smaller character a detail of various things for the instruction of a person who wanted to write upon the subject. The locality and the time when the specimen was procured, I think, is indispensable, particularly in the birds and fish, because the plumage of the birds and the colour of the fish vary at different seasons, so that the time at which it is captured ought to be stated; and also, I think, the donor's name ought to be marked, to encourage others to send specimens, and as an authority for the specimen. I think the label or the catalogue ought also to contain the name of the officer of the Museum who has ascertained the specific name of the species, as an authority for its designation, and rendering him responsible for the correctness of his investigation.

2199. Your last answer refers not so much to the label as to the catalogue?—It ought to be in the catalogue, but the catalogue cannot contain all the additions, and therefore it might be inserted upon the label till the catalogue is revised and amended, which should be done at certain periods.

2200. You have stated that the collection of British birds is in your judgment nearly complete?—I believe it contains several specimens not to be found elsewhere, and it seems to be very nearly complete; I cannot speak as to its being actually complete. There are always wandering birds that come to this country, therefore there will be new ones discovered now and then.

2201. With respect to the mammalia, do you consider that there is such a classification observed as either science would require or space would admit?—The specimens

specimens of mammalia are crowded at present, but Cuvier's arrangement, I think, is generally adopted, which is the arrangement that I should recommend; I think there is such an arrangement as the present state of science requires.

2202. A large portion of the mammalia being in the old building?—Yes, the mammalia principally in the rooms in the old building.

2203. Where the space is confined?—The space is confined. I should say, that owing to the specimens being angled a little, from being crowded, the eye does not catch the names so rapidly as it might do if there were more space.

2204. Are you able to state, from your own personal examination of the Museum, whether there are many of the specimens without their scientific names?—I cannot speak as to the number; I can say there are some, but I should say not a very great proportion. It is a work of time to place the scientific names, a considerable time being required to ascertain them correctly, and if not correct they are worse than useless.

2205. Would you say "that by far the greater number of the mammalia" were without their names?—No; I cannot speak as to the numbers exactly, but the impression upon my mind is, that the greater number are named, and correctly named.

2206. Do you consider the names of Linnæus "antiquated"?—A naturalist must always refer to the Linnæan names, and so far they are not antiquated. From the great number of new species that have been discovered, new names have been necessary, but his specific names must always remain, although the generic names are altered to suit the new systems.

2207. Mr. *Hawes.*] No one would think of naming a collection now after the Linnæan nomenclature exclusively?—He could not, because there are so many new species discovered since Linnæus's time, and even new families and new genera, that his arrangement does not embrace them.

2208. Then in a zoological sense the nomenclature of Linnæus may be considered antiquated?—It must always be referred to; his arrangement may be considered as antiquated, but his generic names have generally become the names of families, owing to the great number of specimens discovered since his time.

2209. Sir *Robert Inglis.*] Do you consider the collection of fish in the Museum to be defective either in number or in arrangement?—It does not contain all the known species by a great deal, I suppose not above a fourth part of the species that are known, and in so far it is defective in number; but it is by far the best that the country contains. It is a question of expense; if the Museum were to go to a greater expense, they could, I have no doubt, procure a greater number of specimens.

2210. The collections which you formed in the course of the two Arctic expeditions were presented by the Government to the Museum?—The collection that was formed upon the first Arctic expedition was presented to the Museum by the Government, the second was only partially presented.

2211. Have you examined the state of the specimens so collected by yourself, since they have been in the Museum?—Yes; they are distributed amongst the general collection, but those that I recognised as of my own collecting appear in very good condition.

2212. Mr. *Hawes.*] Do not you think that attaching the proper scientific names to the objects in the collection, is one of the most important parts of the collection, whether in reference to science or its utility?—I think a specimen is of little use to the student if a wrong name is attached, and not of much use if the name is not attached at all; I think it is a very important part to attach the proper name.

2213. Is it not one of the most difficult parts?—It requires a great deal of time, but as the collection becomes more perfect, it will be considerably easier, inasmuch as there are fewer undetermined species in each genus for the mind to vacillate between, as to the proper name for the one new to the collection.

2214. It requires a superior person and also some considerable time accurately to name a collection, and therefore it may be considered the most expensive part?—It may be considered a very expensive part of the arrangement, inasmuch as it requires a naturalist thoroughly acquainted with that particular branch, and also a good deal of that naturalist's time to do it correctly.

2215. Have you examined the collection of fish in the Museum?—I have had occasion to consult it.

2216. Are you accurately acquainted with it?—Not with the whole of it, but with some particular tribes I am.

John Richardson, M.D., F.R.S., F.L.S.

21 April 1836.

2217. Can you state whether it is generally pretty accurately named?—Not generally; in the particular groups of the fresh-water fish of America, the generic names appear to be correctly given, but the specific names of fish were very imperfectly understood by any naturalist till the publication of Cuvier's work, which is not finished yet; he is the great authority for the specific names of fish.

2218. Were they accurately named when you first visited them, or have they improved since?—I do not recollect the fish being arranged when I first visited the Museum.

2219. What date do you then speak of?—They have been put up within two or three years, but I cannot speak positively upon that subject, because it is only lately that I have been writing upon fish, and have had occasion to consult that part of the collection.

2220. Has the improvement in that collection been very recent?—I was absent part of the time, but it appears to me to be very great within these four or five years.

2221. And still there is a large portion of the fish unnamed?—There is a portion unnamed, I cannot say whether very large or not.

2222. With regard to reptiles, you have said that the reptilia are in a perfect state and well arranged?—They are in a perfect state, and they seem to me well arranged. I do not profess to be so well acquainted with reptiles as with other vertebrate animals, but it is an arrangement that I should think would be quite sufficient to facilitate my using any specimen for the purpose of study or of comparison.

2223. Are they generally named?—Some of the tribes have not got the specific names; they are classed in families and in genera, and many of those families and genera have the specific names also.

2224. Are not many without the generic name?—I do not think there are many; there may be some, but I do not know, not having gone over the whole collection carefully.

2225. Can you generally read the names, so as at once to understand the arrangement?—When I have had occasion to consult the Museum, one of the officers has generally attended, and he has at once handed to me what I wanted. The cases are too high to read the names of some of the specimens; on the upper shelves it is difficult to read the names.

2226. Are not many specimens designated merely by their locality, such as China or Brazil, without any generic or specific name?—There are many species of fish which have only China or Brazil upon the ticket, but there is a ticket with the family name appended to the whole of that shelf, that would enable a person to find it out.

2227. Which is easily and obviously visible?—Yes, I think so, when one makes oneself acquainted with the plan of the arrangement.

2228. But unless you are well acquainted with the plan of the arrangement, you would not find it out?—I think that a person going to study ichthyology, without any previous acquaintance with it, would find a difficulty; but a person that is acquainted with ichthyology would have no difficulty.

2229. Then at present the collection is less useful to the student and the beginner, than to the man of science?—It is certainly more useful to the man of science than to the student and the beginner.

2230. In any part of the Zoological collection have you discovered any gross errors in the names?—No, I have not discovered any gross errors; in some of the species there are questions amongst naturalists as to what species the author alludes to, and no three naturalists would agree upon some points of that kind; it would depend upon the extent of their researches into that particular branch; but I have discovered no gross errors myself.

2231. Have you seen some of the labels written in pencil, and indistinctly written?—Yes, I have.

2232. Do you think that creditable to a national institution?—I consider the collection as in the progress of arrangement, and that it has been so put to assist the officer arranging it; probably he has not made up his mind upon that point, and has not ascertained the name to his satisfaction; but it is not a state in which the label ought to remain.

2233. The question does not assume it to be a temporary arrangement, but one hat has lasted some time?—I consider the collection as in progress of arrangement only. I think every collection must, more or less, be in progress, because all new specimens require a certain time to ascertain their names and to arrange them

them properly. I have understood that in foreign collections they do not exhibit the specimens till they have ascertained their names.

2234. Have there been names written in pencil ever since you frequented the Museum?—I should say yes.

2235. How many years is that?—I have known the Museum 16 years.

2236. Sir *Robert Inglis.*] Have you observed that the same specimen has, during the 16 years, had the name written in pencil?—No, I cannot say that.

2237. In other words, then, does your previous answer mean that through the whole of that period the collection being in progress, there have from time to time been names written in pencil?—I cannot speak as to the length of time that the names remained written in pencil; but my recollection was, having examined the Museum at various times, that as specimens were supplied to the Museum, the names were put in pencil till it was ascertained that the name was correct by thorough examination.

2238. Then you do not wish the Committee to understand that the same specimen has had the name in pencil from the beginning of your knowledge of the Museum until now?—No, I cannot speak as to the time it has remained.

2239. Mr. *Hawes.*] Do you mean to be sure that many of the pencil labels have not been in that state for many years, and your attention is particularly called to the collection of fish?—I do not speak to the collection of fish above three or four years.

2240. During that period have you or have you not seen the same pencil labels in the Museum?—I cannot say whether I have or not.

2241. *Chairman.*] Does it appear to you that it is the practice in any of the departments in the British Museum to write the names in pencil, and if so, do you attribute it to negligence on the part of the officer who has the charge of that part of the Museum, or do you consider it merely a temporary inscription of the name, with a view of ultimately completing it in the ordinary way?—I should not attribute it at all to negligence; because, for example, if I were labelling a collection myself, I should adopt the same plan of writing in pencil till I had ascertained completely by the acquisition of other specimens, or by further examination, that the name was correct. It is an advantage to the student to find the name in some cases written in pencil, because he would suppose that there was a doubt upon it, and that it is not of the same authority as a name printed and stuck up.

2242. As far as you have observed the practice of the British Museum, with reference to that particular, do you find anything that you think objectionable, or that requires amendment?—I am not aware of anything objectionable; in fact I should say, that in consulting the Museum, the finding some of the specimens in pencil would be an advantage to me, because being made aware that there was a doubt about the name, I should ask one of the officers why the name was in pencil. I have done so; and then the officers generally have references beneath the stand, so that they can answer those questions by applying to a written index to the specimens.

2243. Mr. *Hawes.*] Is there any one department in the Zoological collection more deficient than others, in your opinion?—The collection of reptiles is probably the best; then the collection of birds; then I should say the collection of quadrupeds; and then fish. I am speaking only of the vertebrated animals.

2244. You are not of opinion, then, that the mammalia is the branch which is most deficient?—It is deficient in some of the larger mammalia; but speaking as to number, I suppose that about one-third of the known and described species of mammalia are to be found in the British Museum.

2245. With regard to the collection of birds, will you state what proportion the species in the Museum bear to the number known?—I cannot speak accurately; but speaking generally, between one-third and one-half.

2246. Mr. *Colborne.*] Though you have known the British Museum 16 years, are you often in the habit of going there?—I reside at Chatham; therefore I cannot visit so often as a person residing in London; but while I have been writing a work upon the North American animals, I went every time I came to London. I came to London for the purpose of consulting the Museum.

2247. Have you found every facility of examination afforded you?—Everything I could wish.

2248. Though there may be room for improvement in this as in most establishments, have you remarked any negligence that you can advert to or inform the Committee of?—None has come under my notice.

John Richardson, M.D., F.R.S., F.L.S.

21 April 1836.

2249. There is none to which you can direct the attention of the Committee to inquire into?—No negligence that I could inform the Committee with respect to.

2250. Mr. *Hawes.*] Might not the collection be better named than it is?—It might be more fully named.

2251. Might it not be better exhibited?—It might be better exhibited also; but I cannot say that that is the result of negligence.

2252. Do not you think the British Museum is an institution susceptible of considerable improvement?—Yes.

2253. Is the collection of the mammalia such a collection as a national museum ought to possess?—It is not such a collection as Great Britain ought to possess.

2254. Is there any one collection in the Museum in such a state, either in regard to classification, or extent or nomenclature, as to be worthy of being termed a national collection of Great Britain?—The collection does not come up to my notion of a complete museum for Great Britain; but that is a question entirely of expense. During the length of time that that Museum has been established there ought to be a much greater collection than there is, if Great Britain chose to go to the expense. There are various ways in which the extent of the collection might be increased at no very great expense; for example, having so many colonies, I think we ought to have collections of specimens from every colony, kept separate and complete.

2255. Mr. *Colborne.*] Might not those observations that you have just made be made of every museum that you have ever seen?—Of every one. I have seen none so complete as the British Museum.

2256. Did you ever see any museum in which there was not a great deficiency of names and some want of arrangement?—None; there is no work on natural history but what is defective; and therefore the arrangements made after those works must be defective.

2257. Mr. *Hawes.*] With what foreign collections are you acquainted?—I am acquainted with no foreign collections, except one at New York, in the United States.

2258. *Chairman.*] Is that an extensive collection; is it such a collection as would bear comparison to the British Museum?—Not at all; it is not a national collection; it is a private collection.

2259. Mr. *Colborne.*] Then, though you have not a great acquaintance with other museums, as far as you have seen, you think the British Museum is as well, if not better arranged than any other?—It is the largest in this country, and the best arranged that I have seen.

2260. Mr. *Hawes.*] Have you ever observed a specimen of a vertebral column of a serpent suspended from the wall, labelled thus, "Vertebra of an Indian boa?"—No; I have not examined it.

2261. Sir *Robert Inglis.*] If you did observe it, should you consider it to be a clerical error, or an error arising from ignorance?—I should think, in the present state of the nomenclature, it was a mistake.

2262. Mr. *Hawes.*] A clerical error remaining open to public observation for some time rather involves negligence, does not it?—Certainly, if there is time to make the alteration.

2263. Sir *Robert Inglis.*] Do you consider that any person entitled to the description of a man of science could be misled by such a designation so suspended?—I should think that nobody acquainted with reptiles would be led into any mistake by it.

2264. Mr. *Hawes.*] Do you think the Museum is exclusively intended for men of science?—No; I suppose the Museum is intended for the public.

2265. Do you think the mammalia are susceptible of any better arrangement, taking the space as you find it in the Museum?—I do not believe there is any arrangement that man can adopt but may be improved upon. It seems to me to be arranged according to Cuvier's system in the great details, and some of the species are differently named.

2266. Are most of them named according to Cuvier's system?—The Linnæan names are given, but they are according to Cuvier's arrangement; Cuvier gives the Linnæan names in the Règne Animal.

2267. Should you be disposed to say that the mammalia are named according to the latest and most improved nomenclature?—They are not named according to the latest nomenclature; but I do not consider the latest as the best.

2268. Will

2268. Will you inform the Committee what improvement you would introduce in a national collection with regard to the nomenclature?—I think it is very well named generally, provided the whole of the specimens were named; that would be an improvement.

2269. Which system of nomenclature do you consider the best?—I think, for a museum, the one adopted in the British Museum is the best arrangement.

2270. Which is generally that of Cuvier?—As to quadrupeds and fish, it is according to Cuvier, and the birds according to Temminck; the British birds according to Jenyns.

2271. Does Cuvier's nomenclature now obtain amongst the first-rate zoologists of the day?—I should say that, generally speaking, the most numerous class of zoologists follow Cuvier; there are various French and other zoologists who have introduced nomenclatures of their own, but none so generally followed as that of Cuvier is.

2272. Did not Cuvier take up very much the old Linnæan names?—He has adopted all the Linnæan names where he could, either as names of his families, or he has retained them as generic names.

2273. Have not many new species and many new genera been discovered since Cuvier's time?—Not many since Cuvier's time, but many since Linnæus's time.

2274. Is it possible to comprehend all the present genera and species known to zoologists within the Linnæan system, even improved as it may be by Cuvier?—All the known species at the time in which Linnæus wrote were included in his arrangement; but there are many families and species since his time to which new generic names have been given.

2275. Have not many naturalists taken objection to Linnæus's plan?—Linnæus's names have been, as I have said, adopted by Cuvier. Many objections have been made to Linnæus's nomenclature.

2276. If Cuvier's system has been founded upon Linnæus's, does not it follow that great improvements must be made to make it useful?—I did not say that Cuvier's system was founded upon Linnæus's; his system is peculiar to himself; but with respect to the animals known in the time of Linnæus, he has adopted Linnæus's nomenclature, and where he required new names he has framed them; but Linnæus's arrangement is totally different from Cuvier's.

2277. Is not Cuvier's system founded upon a knowledge of comparative anatomy?—It is founded upon the structure of the animals.

2278. Can you state the names of the zoologists who have differed recently from Cuvier's system of nomenclature?—Almost every writer introduces some little difference. I think Dr. Grant has given a new arrangement.

2279. What is your opinion of that?—I am not sufficiently acquainted with it to give an opinion upon it. I am not aware that any writer has followed him.

2280. Is not he a distinguished naturalist?—He is a distinguished comparative anatomist. I am not aware that, except in one particular branch, he has studied animals in their natural state or localities. I think he has studied some marine animals.

2281. Are not his works considered the standard works of the day amongst zoologists?—His lectures on comparative anatomy are considered very good; but I am not aware that any zoologist follows his arrangement, and there is great difference of opinion as to its value.

2282. Sir *Robert Inglis.*] You would not consider it an impeachment of the science of any other man that he preferred Cuvier to Dr. Grant?—Certainly not.

2283. Sir *Philip Egerton.*] Dr. Grant has not published any complete work upon zoology, has he?—Certainly not. There has been no complete system of zoology recently published in England.

2284. And his lectures upon comparative anatomy are now in course of publication, not yet completed?—They have been published in periodical works; he is going on publishing, but he has completed a series of lectures on comparative anatomy, published in the Lancet.

2285. But not as a separate publication?—It is publishing separately also.

2286. Are you aware of any museum, except Dr. Grant's own museum, which is arranged according to Dr. Grant's arrangement?—I am not aware of any.

2287. Of course the trustees of a national museum would not be justified in adopting an arrangement upon so slight an authority as that of a work of a naturalist giving his own views upon a subject, which views have not been adopted in any other collection with which you are acquainted?—I think that their so doing

John Richardson, M.D., F.R.S., F.L.S.

21 April 1836.

doing would cause them to change frequently. Every naturalist of eminence may suggest a new arrangement, but the scientific public only follow certain arrangements; they follow Cuvier, and with regard to fish, in particular, Cuvier is the only person that has described a great number of species; his arrangement must for many years be the only useful one to the student.

2288. Do you think the trustees of a national institution would be justified in adopting such a system as that referred to in the question?—I think they would be wrong if they did.

2289. Mr. *Hawes.*] Are you aware that Dr. Grant is professor of comparative anatomy in the London University?—I am.

2290. Should you be disposed to consider an elaborate work by him upon the arrangement of a system of natural history as a slight authority for an officer to rely upon?—I should not consider Dr. Grant's authority a slight authority at all. He is a comparative anatomist of eminence.

2291. Have you examined the entomological collection of the Museum?—I am not acquainted with entomology.

2292. Sir *P. Egerton.*] Do you consider that a work which can be comprised in four small numbers not the thickness of a single number of Blackwood's Magazine, comes within the designation of an elaborate work upon natural history?—I should not consider that it would depend upon the extent of the work. I think a small work may be an elaborate work.

2293. Even upon so extensive a subject?—He might compress the facts into a very small space; and I think it may be an elaborate work, though in a small compass.

2294. Mr. *Hawes.*] Are you at all acquainted with the constitution of the British Museum?—I am not acquainted with the rules and constitution of the Museum.

2295. Should you consider it any part of such an institution as the Museum to encourage men of science, as well as science generally?—I should think so; I should think it would be proper to encourage science and men of science; if they encourage the one they encourage the other.

2296. Do you think the selection of eminent men of science, for the purpose of raising them to the office of Trustee, would be considered as an honorary distinction, and one acceptable to men of science?—If he was raised to that situation in consequence of being a man of science, I should consider it an honorary distinction.

2297. Do you think the British Museum at present fulfils, to your satisfaction as a man of science, that part of its duty of encouraging men of science?—I am not aware of any encouragement that they have bestowed upon men of science; I have not turned my attention to that point.

2298. What would be your opinion of admitting a larger proportion of scientific men to share in the government and management of the institution?—I think it would be useful to the institution, inasmuch as they would get the opinions of those scientific men easily, and at no expense to the Museum.

2299. You do not apprehend that such a board would be filled with such rivalries and jealousies, as to make it a perfectly impracticable board?—I do not know why scientific men should be more subject to rivalry than others.

2300. Sir *Robert Inglis.*] Are you acquainted personally with any institution in London, in which there has been a large proportion of men of science in the governing body; for example, the Zoological Society; and can you state to the Committee whether, in your experience, there have or have not been many discrepancies of opinion?—I am not acquainted much with the Zoological Society; but a very large proportion of the Zoological Society are not men of science.

2301. Mr. *Hawes.*] Do you think there would be any benefit derived from extending the hours of exhibition, either later or earlier in the day; that is to say, giving the public an opportunity of visiting the collection both earlier in the morning and later in the evening, only confining it to the hours of daylight?—I think it certainly would benefit the public to extend it as long as they had light. It would require an increase of the number of attendants.

2302. Do you think it would be desirable, provided it could be done with convenience, to open the Museum during the great public holidays, such as the Easter holidays and the Whitsun holidays?—I cannot speak as to that.

2303. Do you apprehend, from the character of the British public, any mischief to the collection from such exhibition?—I should apprehend not; but I should not think it proper to open it on fast days.

2304. That

2304. That you would object to upon religious grounds?—Yes.

2305. But in the Easter week you see no such objection?—I see no objection.

2306. Mr. *R. Colborne.*] Do not you think at that period there may be many individuals that have leisure to go there, who never have it at any other period?—I dare say there might.

2307. And therefore, as a national institution, it would be beneficial to throw it open at those periods?—I think everything that tends to increase the facilities of the public entering the Museum would be beneficial.

2308. Sir *Robert Inglis.*] You give an opinion without knowing how far there may or may not be a necessity for closing the Museum at those periods, with reference to the formation of new arrangements and cleaning the Museum?—I give the opinion without having thought upon the question; there must be days on which the Museum is closed for the purpose of cleaning the specimens.

2309. Mr. *Hawes.*] The question was founded upon the assumption that it might be done without inconvenience and mischief?—It would require a greater number of officers if the Museum was longer open probably.

2310. Speaking generally with reference to the character of the people, and the utility of the collection, you think it not at all likely to injure the collection, to extend the time and the hours of its exhibition?—Speaking in reference to the character of the public, I think the greater the facilities given in visiting museums, the more they would become accustomed to them, and the better they would use them.

2311. You think it calculated to improve the national taste and the national character?—Certainly.

2312. Mr. *Colborne.*] And if it was necessary to shut it up a week or a fortnight, that they might better take some other week than the week of the Easter holidays?—I think so.

2313. Mr. *Hawes.*] When you visited the Museum, did you find good manuscript catalogues of the Zoological collection, or any part of it?—The officer generally had a catalogue when I visited it, to which he referred.

2314. Was it rather a private document than a public one?—I cannot say as to that. It had the appearance of being a document belonging to the Museum; I never asked the question; he produced it when I asked to know the origin of a specimen which was not clearly expressed upon the label.

2315. Sir *Robert Inglis.*] It was made available to your purposes, you having come to the Museum as a stranger?—Yes.

2316. Mr. *Hawes.*] When you first went as a stranger, did you find out that catalogue?—There has been a catalogue ever since I remember; I speak of the manuscript catalogue. When Dr. Leach was there, he referred to the catalogue.

2317. Was it accessible to the public?—I cannot say.

2318. Sir *Robert Inglis.*] But it was accessible to you, being one of the public, who went there as a stranger?—Yes.

2319. Mr. *Hawes.*] When you first went to the Museum, did you know Dr. Leach?—No.

2320. How did you obtain a sight of the catalogue?—I was already connected with the expeditions, and upon my going to Dr. Leach and saying to Dr. Leach that I was going upon an expedition, and I wanted to get information upon those specimens, he gave me the catalogue and every facility for consulting the Museum.

2321. Did Dr. Leach know who you were, and your official appointment at the time?—I told him; I told him upon what service I was going.

2322. Mr. *Compton.*] You stated that it would be of advantage to the British Museum to have scientific men appointed as Trustees, because it would be possible to obtain their opinions easily, and at no expense. Do not you think those opinions would be as easily obtained and as well obtained, if the scientific persons were placed over the different departments of the Museum, as if they were themselves Trustees?—I should think there would be no difference in that respect.

2323. Mr. *Hawes.*] What is your opinion as to the value, to scientific men, of a catalogue generally of the Zoological collection?—The value of a catalogue must depend entirely upon the knowledge of the author, and his reputation.

2324. Assuming the officers of the Museum to be competent to the formation of such a catalogue, do not you think that the formation of one would be valuable to men of science?—I think it would be very valuable.

2325. Sir *Philip Egerton.*] Will you have the kindness to inform the Committee

John Richardson, M.D., F.R.S., F.L.S.

21 April 1836.

mittee what is the title of the publication of Dr. Grant, which has been mentioned as an elaborate work of Natural History?—I cannot mention the precise title; I spoke of Dr. Grant's lectures, which were first published along with other matters in the Lancet, and afterwards published as a kind of appendix to each number.

2326. What are the lectures on?—On Comparative Anatomy, and generally on the arrangement.

2327. Mr. *Hawes.*] Which is the very foundation of the Cuvierian arrangement and classification?—Yes; comparative anatomy is the foundation of the Cuvierian arrangement.

2328. Sir *Robert Inglis.*] Do you consider that the work of Dr. Grant on comparative anatomy strengthens his claim to form the nomenclature for the zoological collection in the British Museum?—I think that is answered in the reply to a previous question, that I think a national museum ought to follow the nomenclature of an author who is generally received by scientific men as an authority, which Dr. Grant is too recent to be, even supposing his system to be a good one. I beg to explain, that in giving this opinion of Dr. Grant, I only speak of his being a very recent author; and I think it is better that the nomenclature of an author which has been for some time established should be adopted than the nomenclature of any very recent author, even supposing it to be better.

2329. Has Dr. Grant published any work from which a nomenclature could be taken for the entire collection?—I am not aware of any.

2330. Mr. *Hawes.*] That is to say, supposing a man, who though he should obtain an equal reputation with Linnæus, were to publish a work in the present day, you do not think that would justify the officers of a public institution taking his system as one to be immediately adopted?—Linnæus's nomenclature was not generally adopted in his own time by authors whose reputations were then established.

2331. Sir *Philip Egerton.*] The Committee have been informed by a witness that, with reference to the present known species of birds, the British Museum does not now contain one-third of what it might obtain by purchase in six months?—I cannot speak as to what it could obtain by purchase.

2332. You have mentioned in your evidence that out of 5,000 or 6,000 species of birds known, the British Museum possesses about 2,000, or more; how then is it possible that they could increase that collection by two-thirds in six months?—Certainly it is impossible.

Mr. *John Gould*, called in; and Examined.

Mr. *John Gould.*

2333. Sir *Robert Inglis.*] YOU are Animal Preserver to the British Museum and to the Zoological Society's Museum also?—At this moment I am one of the superintendents of the Zoological Society, ornithology being my department, and I am the animal preserver to the British Museum.

2334. You are the author of several magnificent works on subjects of ornithology?—I am.

2335. The Century of Birds from the Himalaya Mountains, a Monograph of the Ramphostidæ, or Family of Toucans, and several other works?—Yes, a Monograph of the Trogonidæ, or Family of Trogons, the Birds of Europe, &c.

2336. Have you travelled much in Europe, and can you state to the Committee the relative value of the different museums in Europe, as compared with each other and with the British Museum, with reference only to the Zoological departments of each?—I can answer more clearly as regards ornithology and mammalia, those being the departments to which I have paid most attention.

2337. Will you state to the Committee what is the rank due to the collection of ornithology in the British Museum, as compared with the collections in Continental museums?—The Leyden collection I consider to be the finest collection in Europe, as it regards mammalia, birds and skeletons. The Leyden collection is not open generally, but it was open to me as a man of science.

2338. Under what restrictions is that collection now kept?—It is not exhibited, for want of space.

2339. Is the collection at Leyden particularly rich in the productions of any particular regions of the globe, or is it a general miscellaneous collection formed from every part?—It is more particularly rich in certain countries, in the Javanese, the Japanese and the Eastern Islands.

2340. Those

2340. Those countries, the Japanese Islands particularly, being countries with which the nation to which Leyden belongs, has the most, if not the exclusive intercourse?—Yes, particularly the islands of Sumatra, Java and Borneo, but not more so perhaps than Japan.

2341. Where do you rank the collection in the British Museum, referring to the Ornithological department, among the great collections of Europe?—I have reason to believe now that it will rank after Vienna. I have lately had a letter from Dr. Rüppell, of Frankfort, in which he incidentally mentions that the number of species in their museum is about 2,500.

2342. What is the number in the British Museum?—I believe it to be 2,300; still I consider the British Museum collection to be superior to that of Frankfort, where many of the specimens are in a bad state of preservation; a considerable number of the birds, from being exposed to the light, have a portion of their colours extracted, which is not the case in the British Museum.

2343. Which do you consider next to the Leyden collection?—I consider the Paris collection the second, and the Vienna collection the third. I am not speaking of English collections, or I should refer to that of the Zoological Society of London. The Vienna collection forms two separate exhibitions; one the Brazilian exhibition, the other the royal collection. I do not know whether that can be considered one collection; they are both national collections.

2344. Mr. *Hawes.*] Both supported by the Government?—Yes, but in two different parts of the city.

2345. Mr. *Colborne.*] Are they under the same directors?—They are.

2346. Sir *Robert Inglis.*] Will you proceed to state the rank which the British collection holds among the collections of Europe?—I consider the collection at Berlin and the collection at Frankfort, and our National collection, to be so nearly the same, that I can scarcely say which is the best. I have this day been looking more particularly to the collection of the British Museum, and I think it may be said to rank after that of Vienna; I consider it to be a collection as good as the general collection at Vienna, but not so good if the Brazilian collection be added to the general collection.

2347. Where would you place the museum of the Zoological Society?—Equal to that of Paris, and perhaps better; but not equal to that of Leyden.

2348. Does your answer refer to ornithology exclusively, or to the general collections in the Museum?—More particularly to ornithology; I think the mammalia at Paris are better than ours.

2349. Did your preceding answer refer to ornithology exclusively, or to the general collection?—In a measure to ornithology. I conceive the collection of mammalia at Frankfort to be superior to that of the British Museum, not in the number of species (for the British Museum collection is extremely rich in species), but as regards fine quadrupeds; from North Africa particularly, there is no collection, not even the Paris collection, equal to that of Frankfort. On the other hand, I conceive that the British Museum collection of quadrupeds is better than that of Berlin.

2350. Are the Committee to understand you to say, that the Continental museums are rich in the productions of particular countries, whereas the collection of the British Museum has specimens from almost every country?—Yes.

2351. Will you state whether the collection in the British Museum has made progress in the course of any given number of years during which you have known it?—I conceive that there is no museum in Europe that has made so much progress during the last four or five years, and particularly during the last three years.

2352. How long have you known the British Museum?—Ten years.

2353. At the period of your first acquaintance with it, the Natural History department was confined, of course, to the old buildings, the new buildings not being then opened?—It was then a very poor collection.

2354. Do you date the great increase to which you have referred, from the period at which greater facilities were given for receiving and exhibiting the collection so increased?—Certainly; since they have had the new room for the birds there has been a very great increase; there has been great energy shown in that department by the officers, and it is now raised to a very tolerable collection, though still far from being complete.

2355. Can you state the number of specimens of birds and of beasts which have been stuffed during the last three or four years?—Yes; in 1831, there were 162 birds;

Mr. *John Gould.*

21 April 1836.

birds; in 1832, 361; in 1833, 321; in 1834, 210; in 1835, 500; in 1836, up to the present time, 72; in all, 1,626.

2356. Mr. *Hawes.*] Do you at all know the sum expended upon birds by the Museum since that time?—I do not.

2357. Sir *R. Inglis.*] Can you furnish the Committee with a corresponding statement of the beasts?—In 1832, there were 12 quadrupeds; in 1833, 9; in 1834, 114; in 1835, 56; and in 1836, 37.

2358. Mr. *Hawes.*] Can you state whether they were chiefly purchases or donations?—I cannot.

2359. Sir *R. Inglis.*] They are transmitted to you from the Museum?—They have been transmitted to me for the purpose of mounting.

2360. Will you state in what condition the collection of mammalia is as compared with its state when you first knew the Museum, or as compared with other collections; first, as to the number of the species?—I believe that it contains more species than most museums; the specimens are not in the best state of preservation, they are not so good as I have seen at other collections, and they are not in that perfect state in which I should like to see them, but still they are extremely desirable; we would rather have a bad specimen than none at all. Many of the species are extremely rare, and even the collection of quadrupeds at the Zoological Society, I think, is scarcely before them; they have better specimens, but not so numerous in the species.

2361. In what tribes is the collection in the Museum chiefly deficient, the question still referring to the mammalia?—They are very deficient in rhinoceri and elephants, in zebras, in many of the large deer and antelopes, and in the large monkeys.

2362. In the animals which require great space for exhibition?—Yes; the whole of these require great space; the collection in the British Museum is more rich in the smaller species of rodent animals.

2363. Do you attribute the deficiency in those animals which require great space to the want of such space in the existing area of the Museum?—I know no room where they could be placed, the cases being full.

2364. Is it the possession of those large animals at Paris, at Leyden, and at Frankfort, which makes those collections appear so much larger?—I should say it is; the lower room at Paris is certainly a very imposing one; it contains a great many large quadrupeds; they have a number of rhinoceri and elephants, and a number of other striking animals.

2365. Mr. *Hawes.*] Does that convey to a scientific eye a notion of its being necessarily a larger museum?—I think it does.

2366. Sir *R. Inglis.*] Are any of the specimens of birds exhibited in the Leyden Museum?—Very few; not above two or three cases; I had always access to two or three, and I believe the public have access to the same number, but the greater part are shut up in boxes.

2367. Are all the specimens exhibited in the Berlin Museum?—When I was there the whole were, but they are now all packed away in boxes, and removed to another house till the place which held them shall be rebuilt.

2368. In other words, they are now in a transition state?—They are.

2369. Are all the specimens exhibited in the Frankfort Museum?—They are.

2370. Are all the specimens in the Frankfort Museum named?—Decidedly not.

2371. Are they named in the Vienna Museum?—Not all.

2372. Are all the specimens in the Leyden collection named?—In no collection are they all named.

2373. Can you state what proportion of unnamed specimens there are in the British Museum as compared with the proportion which you have observed in other museums; in short, are there more specimens in the British Museum left without names than you would find in other museums of equal size?—I think there are.

2374. Can you state whether a larger proportion be named now than was named when you first knew the Museum?—Decidedly.

2375. There has been therefore progress made in attaching names to the collection?—Yes. I would here beg to state that it would be extremely difficult to name any collection perfectly; it would require a profound ornithologist to do so, and it would require a man to be solely occupied with it, and to have a very extensive ornithological library, and he must, moreover, be a competent ornithologist.

2376. As animal preserver to the British Museum, can you state whether the collection of mammalia consists of "the most common and cheaply acquired species," as has been represented to this Committee by one of the witnesses?—I do not think so; I think there are a great many rare species.

2377. Can you state whether the British Museum contains 20 cats of one species?—Certainly it does not.

2378. If it have been stated that there are 25 mice and about as many rats, and nearly 50 squirrels, would that be correct?—There are not that number of the same species, not to-day certainly.

2379. By limiting your answer to "not to-day," do you mean that there have been such a month ago, or at any given period within your knowledge?—I do not believe there have; I have not paid that attention to the mammalia which I have to the birds, but on going past the cases I should say they are all as full now as they have ever been.

2380. In short, you do not consider that any alteration has been made within the last month?—I know of none.

2381. Are you aware of any collection in natural history in the world which you consider as even approaching to perfection?—Not one.

2382. Sir *Philip Egerton.*] The Committee have been informed by Dr. Grant, that "the Zoological department of the British Museum is miserable in funds, miserable in science, miserable in materials, and its collections are for the most part without either classification or nomenclature; that the best specimens are exposed to dust and insects, and that the chief constituents of our collection of the class mammalia in the British Museum, are mice and rats, shrews and moles, squirrels and rabbits, hares and cats." Do you consider that a perfectly fair and impartial account of our collection of zoology?—Decidedly not. I think any gentleman going through the different collections would come to a different conclusion. It is far from being perfect; but I think if they proceed with the same energy that they have done during the last three or four years, it would soon rank among the first collections.

2383. Mr. *Hawes.*] What do you mean when you speak of the energy which has been shown at the Museum?—I mean more particularly of the officers in the Zoological department; I conceive that they have exerted themselves greatly.

2384. You do not include the Trustees?—Not at all; I know nothing of the government of the Museum.

2385. Sir *Robert Inglis.*] But it has been under the management of the existing constitution that the extraordinary increase has taken place in the collections of the Museum to which you have referred?—Yes.

2386. You are not aware of any change in the constitution of the Museum during the period when this increase has taken place?—I am not aware of any.

2387. Mr. *Hawes.*] You do not happen to have heard whether the Museum has received more by way of donations the last few years than it did before?—No.

2388. You have not the means of forming an opinion whether the increase is more owing to donations by travellers and other persons, than to any activity on the part of the officers?—I do not believe it is owing to donations, I believe a great part is owing to purchases.

2389. How much do you think has been spent on the mammalia the last five years upon an average?—I cannot say.

2390. Do you think 25*l.* a year would be a large allowance?—I think it would be a very small allowance.

2391. Would that furnish the specimens you have stuffed for the Museum?—Not a fourth part.

2392. Suppose something under 40*l.* had been spent, would that be a large allowance?—A very small one.

2393. If these are about the sums that have been spent upon those objects of natural history, must it not follow that if there has been a great increase it must have been chiefly by way of donations?—Those collections might have been in store.

2394. Have you any reason for thinking that they had been in store?—I have seen some things in store.

2395. How long ago is that?—Three years; I think three years was the first that I saw.

2396. Will you describe what you saw when you visited the store-room?—

Mr. *John Gould.*

21 April 1836.

I received a letter from Mr. Children, requesting me to examine the stores, and to report if there were any that I thought worth mounting; and, after having done so, I answered that certain mammalia would make good specimens, and they were accordingly preserved.

2397. In what state were they when you saw them in store?—They were pretty good.

2398. Were there any that were not quite so good?—There were some.

2399. In what state were they?—Having been shut up for many years they were of course injured by moth, but not to any great extent.

2400. Did they appear to have been safely deposited for a good long period?—They were in large chests.

2401. Did the chests bear the appearance of a little ancient dust about them?—I do not think they did; they appeared to me to be new chests, if I recollect rightly, but I do not speak with confidence.

2402. Where was this store-room?—I believe in the room next to Mr. Children's.

2403. Up stairs, or down stairs?—Up stairs; I know that some of them were.

2404. What was the extent of the number you saw there?—I cannot say.

2405. Sir *Robert Inglis.*] When was it that you visited this store-room; was it before or since the completion of the new buildings?—I think it is since.

2406. Mr. *Hawes.*] What were the objects that you saw there?—They were principally large animals, some Rocky Mountain sheep; I cannot recollect the number of animals.

2407. Have those Rocky Mountain sheep been exhibited since?—Yes, such as were fit were preserved immediately and put into the cases.

2408. How many did you extricate from their confinement?—I cannot say; I think of the larger kind some seven or eight; not a great number.

2409. Are there many still left in the store-room?—Not a great many.

2410. Do you think that the stores of the Museum would not account for the great increase of the collection, without reference to the expenditure?—It might; I am not certain how they became possessed of those animals.

2411. Then the donations may have been very extensive within the last few years without your knowing anything about it?—Yes, they may, certainly.

2412. Speaking as a scientific man, is the zoological collection quite in the state that you would wish it, even with reference to the accommodation afforded and to the number of officers there are to superintend it?—I would rather speak more to the quadrupeds and the birds, which are the departments I have paid greater attention to than to the others; but I do not conceive that any better arrangement of the quadrupeds is wanted, and from what I saw to-day of the birds, I do not know that I could suggest any better arrangement; they look very clean. I went with a view to examine the collection, thinking that I might be asked the question; I had not examined it before for a long time, and it made a favourable impression upon my mind.

2413. Mr. *Compton.*] Is there room at present in the British Museum to exhibit the specimens now in store?—I question whether there are any in store that would be in a proper state to mount.

2414. Mr. *Hawes.*] You have only visited one store-room at present?—I do not know how many store-rooms there are.

2415. Sir *Philip Egerton.*] You do not look upon the whole of the British Museum as more resembling a store-house than a school of zoology, as the Committee have been informed by Dr. Grant?—No; it might have been so at former periods, but not at present, decidedly.

2416. Sir *Robert Inglis.*] At present, since the new building has been open, you would not apply that description to it?—Decidedly not.

2417. Mr. *Hawes.*] You would not call it a school of zoology at present, would you?—No.

2418. Mr. *Baring.*] Do you remember any time when the space existing was not adequately filled with the exhibition of objects of zoology?—I think I recollect a time some years back; there appears to be more decided energy used by the officers within the last three or four years to fill every case, and to get up every specimen worth mounting, so as to make as good an exhibition as possible.

2419. Mr. *Hawes.*] Does the collection of birds contain a fair proportion of the more interesting species of the tropical climates?—I think it does.

2420. In proportion to the means which this country possesses of obtaining such specimens from those parts of the world?—Perhaps not.

2421. With regard to the nomenclature, are you quite satisfied with it as a scientific man, either with reference to the mammalia or the birds?—I think it might be better.

2422. Does it come up to the present state of science, so as at once to assist the student, and at the same time to benefit the man of science?—I think a better arrangement might be made.

2423. Sir *Philip Egerton.*] The Committee have been told by Dr. Grant, that they are for the most part without either classification or nomenclature, is that your opinion?—No; they are very well classed, the families are put together.

2424. Mr. *Hawes.*] Supposing that to mean the best classification, and the best nomenclature, what should you say?—There is a great difference of opinion upon that subject; it depends upon the system you adopt, whether the system of Temminck, of Swainson, or of Vigors.

2425. Does the system of Temminck run through both the British birds and the general collection?—I cannot answer that question; I have not made it an object to look at the collection of the British birds.

2426. With regard to the collection of general birds, whose system is adopted?—I think Temminck's.

2427. Are any departures marked?—No.

2428. Are all the labels pretty clearly written?—All the birds are not labelled; those that are appear clearly written.

2429. What proportion do the labelled bear to the unlabelled?—I cannot say.

2430. Are the majority labelled?—I could not answer that question.

2431. How recently have you visited that collection?—I saw it this morning.

2432. The first time for how long?—I am frequently at the British Museum; if I had been aware that this question would be asked, I should have been able to answer it.

2433. Do you think the nomenclature of the zoological collection generally, is more perfect and more extensive than in any other collection?—I think not; I think it is not more perfect; there is no collection perfect.

2434. Speaking as to comparative perfection, how should you rank it?—It is nearly as good; I should say there is very little difference; I visit collections for the purpose of gaining information, and I find a great want of nomenclature; in the Ornithological department it requires a person to spend a great deal of time.

2435. Do you know any other country in the world with the same wealth and the same means of communicating with other countries as this country?—Decidedly not.

2436. Then speaking with reference to the wealth and the power of communication of this country, do you think this collection is in the state in which it ought to be?—Certainly not.

2437. Do you know any museum in any country, which is headed by so many eminent and influential men in the political world as the British Museum is?—I am not able to answer that question.

2438. Do you know that the Prime Minister is a Trustee?—I was not aware of it.

2439. Do you know that the Lord Chancellor and the Archbishop of Canterbury are Trustees?—Yes.

2440. Do not you think that those Trustees, if they used their high official influence with the Government, might very well extend the means of the Museum?—Yes.

2441. Do you think it has improved in proportion to the number of persons of great influence at the head of it?—Perhaps not; I think it has improved more by the persons who are directly in charge of the separate departments.

2442. In fact, you think that the professional and scientific men at the head of the various departments, would form a much more useful working Board for the general improvement of the institution, than a Board composed of so many earls, dukes and marquisses?—I cannot answer that question.

2443. Sir *Robert Inglis.*] You have stated that whatever may be the constitution of the British Museum, the collections have made a greater progress in the course of the last three or four years than in any other museum in Europe?—That is my firm opinion.

Mr. *John Gould.*

21 April 1836.

2444. Mr. *Hawes.*] That is owing to the energy of the officers of the Museum? —I am induced to believe so.

2445. Sir *Robert Inglis.*] Still acting under a constitution which you believe not to have been changed in the interval during which that progress has been made?—Yes.

2446. Mr. *Compton.*] Did not you observe the skins of some very large animals that were in the boxes that you examined some time ago under the direction of Mr. Children; do you remember a camel?—I remember a camel, but that was recently.

2447. Were there any other large animals in the collection?—There were two camels; I scarcely recollect anything else.

2448. Are they in a fit state to be preserved?—They are.

2449. Is there room enough in the British Museum to exhibit those animals if they were preserved?—There are no cases to receive them; you might put them on stands in the centre of the room.

2450. Would that be a proper mode of exhibiting them?—I should say for animals of that size it would be a proper mode. They are exhibited so on the Continent.

2451. Are they not liable to suffer from moths?—The camel is more liable than most other animals; but zebras, cameleopards and other short-haired animals do not injure at all with ordinary care and in a dry room.

2452. Then you would not advise the camels to be so exhibited?—I think I should advise it to be tried if there were no cases; I think they would last a number of years, although they would be better under glass.

Mr. *John Edward Gray*, called in; and Examined.

Mr. *John E. Gray.*

2453. Sir *Robert Inglis.*] YOU have known the collections in the British Museum all your life?—I have, my uncle and others of my family having been officers of it. I have consequently taken an interest in it from my childhood.

2454. And for the last 20 years you have been perfectly acquainted with them? —Yes; I became acquainted with Dr. Leach in 1816, and occasionally assisted him in the arrangement of the collections. After a short interval I also became acquainted with Mr. Children, and continued to give my assistance until I was appointed, in 1824, to the office I now hold.

2455. Will you state to the Committee the changes which the collections of Natural History have undergone since the institution of the Museum, and more immediately since your own personal acquaintance with it?—It appears that in 1761, shortly after the Museum was first opened, there were four rooms for the Natural History collections, one (No. 8) for the minerals and fossils, one (No. 9) for shells, one (No. 10) for vegetables, insects, &c., and one (No. 11) for animals in spirits. In 1808, the small room (No. 12) which had previously contained artificial curiosities, was added to the department, which was then arranged as follows: No. 8, minerals; No. 9, shells, fossils and herbals; No. 10, insects, worms, coral and vegetables; No. 11, stuffed birds and quadrupeds; No. 12, animals in spirits.

2456. Will you state upon what authority you make this statement?—The authority for the arrangement existing in 1761 is an anonymous History of London, published in that year; for that of 1808, the Synopsis of the Museum, which was then first published; what follows I give on the authority of the subsequent editions of the Synopsis and from my own recollections. In 1813, the saloon was opened for minerals; in 1815, the Natural History occupied six rooms. Before this time the various branches of Natural History had been arranged in the same room, the minerals and plants with the animals and their parts; but on the re-arrangement which then took place (the plants and fruits having been removed to a private room to make way for other subjects supposed to be more interesting to the public), the minerals and fossils occupied three rooms, viz. the saloon, Nos. 8 and 9, and the zoology three rooms, viz. Nos. 10, 11 and 12. In 1816, No. 11 was closed for re-arrangement, and was again opened with the British collection of zoology in 1819, No. 12 being at that time taken for a private room. In 1816, the shells were removed from No. 10 to a smaller room, No. 8; and in 1818, No. 10 was opened as a British oryctognostic collection; so that at that time the minerals and fossils occupied three rooms, and the general zoology and the British zoology one each. In 1832, the whole collection was removed; the

the minerals and fossils to the long gallery in the new building, and the zoological collection to the saloon, the three rooms of the old building formerly occupied by the manuscripts, and the large rooms in the new building.

2457. At this moment a large portion are still in a state of progress and transition?—Yes; they are only placed in their present situation until the new galleries are ready for their reception. I will now proceed to state the changes that have taken place within the last nine years. The British collection of birds, which about nine years ago occupied one room, now occupies a room about a third larger. The British collection of shells was placed in drawers under the birds; it is now considerably increased in extent, and (with the eggs of the British birds) is exhibited in the table cases of the British bird room. The general zoological collection nine years ago occupied only one room of very moderate size, which contained the collection of foreign birds, occupying 45 feet of low shallow wall-cases; and to these were added, about 1826, two small cases of Arctic birds, placed in the middle of the British bird room; this entire collection now occupies 216 feet of much deeper and higher cases, containing nearly 15 times the space then afforded. The general collection of shells, which formerly occupied the middle of the room containing the foreign birds, was contained in eight table-cases; it now occupies 44 rather larger tables. The collection of corals then occupied a single table-case; it now fills 12 such cases. The cirrhipedes remain, nearly as at that time, in one single case. Dr. Leach paid so much attention to this class, that but few additions have since been made to it. In all these instances of increase, it is not that the specimens have been more widely spread, or that space has been left for the wanting species, as in the insects, but there has been a real and corresponding increase in the number of the species and specimens exhibited. There were only a very few mammalia exhibited above the cases containing the foreign birds until about 1827, when some cases were erected over those which contained the British birds, and about 200 specimens of mammalia were placed in them. The collection of mammalia is now increased to upwards of 400 species and upwards of 700 individuals, which are arranged in the cases in the saloon and in the adjoining room. In 1832, when the new building was opened and more space afforded, there were added to the exhibition four table-cases of crustacea, to illustrate the general arrangement of that class; one table-case of arachnida and myriapoda, three table-cases of insects, and eight table-cases of radiated animals. There were also added the collection of nearly 1,000 species of fish, both dry and in spirits, which occupy 75 feet of wall-cases; the collection of about 600 species of reptiles, both dry and in spirits, which occupy 75 feet of wall-cases; and the collection of specimens preserved in spirits of crustacea, insects, arachnida, myriapoda, cirrhipedes, radiated animals, and mammalia, which occupy 33 feet of wall-cases. Indeed the entire collection, within the last five or six years, has been increased nearly tenfold, and many important collections have been exhibited which were never shown before.

2458. What is the method adopted in the Museum upon the increase of any one division of the department of Natural History?—Immediately on the opening of the new rooms, we arranged all the collections which we had in store for public exhibition; and it has been our custom to put every specimen, as soon as received, into its genus or order in the systematic distribution of the specimens.

2459. Does this give the students generally a facility in consulting the collection?—It gives them all the facility of a classed catalogue, with the advantage of being always perfect as far as it goes. Almost every specimen we have is arranged in its class, order, and genus, in the system followed in the collection, so that if anybody comes to examine or look for a species or an individual specimen, he knows at once where to look for it, if he has any knowledge of zoology, or if he will take the trouble to consult the Synopsis, which gives an account of the manner in which the collections are arranged.

2460. It has been stated that several of the specimens are not named, and that others are named in pencil; will you explain to the Committee what is the fact, and what is the reason of such fact?—Many of the specimens are not named, because when received they are put immediately into their place in the systematic arrangement, without waiting to determine their names. This saves much time, and is a great advantage, as the only way in which a collection can be satisfactorily named is by the officer taking up an order or a genus, and at once working it out. By this means he is enabled to make the necessary comparisons, and to determine, in a much shorter time and with greater certainty, the characters of the species,

Mr. *John E. Gray.*

21 April 1836.

than if he studied them one by one as they arrived or occurred to his hand. One part of the collection must consequently remain unnamed while the other is being named, unless the number of officers is very considerably increased. A few names may be written in pencil; for instance, if a shell or other specimen has been removed from a dirty board to a clean one, in order to preserve the name of the species, the locality, or the name of the donor, these have been written temporarily in pencil, with the intention of writing them in ink at a future time. Or if I am told by a visitor that any particular species has a name given to it in any work, I may perhaps write that name on the front of the board in pencil, until I have an opportunity of consulting the book, because to put it in ink at once would be to give the sanction of the officer of the Museum for a name which he had not verified. I believe, however, that there are very few instances of pencil names in the collection.

2461. In fact you put the specimen into its place in the collection as soon as you receive it, reserving for subsequent consideration the propriety of the nomenclature which you should apply to it?—We do, and then take up some large group (a class, an order, or a family), and work it out in monographs, which is the only way in which the nomenclature can be determined with satisfaction or certainty.

2462. In this way you exhibit at the moment the specimen to the public?—Yes; and it becomes of use not only to the public, but to the student. If we adopted a different plan, (which I am aware is followed in some Continental museums,) only those specimens could be exhibited which the officer had found time to name, and a great part of the collection would be kept from the eye of the student and the public.

2463. Do you attribute that increase in the collections in the British Museum, to an increased taste in England for science, or to the increased facilities arising from additional space for the reception and exhibition of the zoological collection within the last few years?—To both; but I think that the increased space was granted on account of the taste for zoology having greatly increased in the country. When I first began to study zoology, there were but a few Linnæan zoologists in London. I hardly knew more than two or three (Mr. Stephens and Mr. Bennett, for instance), who studied the modern system of zoology, which had superseded the Linnæan on the Continent of Europe. There was no taste for modern zoology in this country before the peace of 1814, up to which time the people generally, and even the scientific men of the day, seem to have been satisfied with comparatively small collections. Dr. Leach, who had been a pupil of Cuvier, was the first to make the English acquainted, by his works and by his improved manner of arranging the collections of the Museum, with the progress that had been made in natural science on the Continent. Thus a new impetus was given to zoology, which has gradually improved into a popular taste, and I believe that as soon as a public taste was manifested for zoology, a large increase took place in the collections of the Museum; and this increase has been going on in an enlarging ratio until the present time, when the collections of the Museum bear a fair comparison with any of the museums in Europe.

2464. Since the increase of space has permitted a better disposition and exhibition of specimens, has there been a considerable increase of donations to the Museum?—Yes. I may mention particularly the extensive donations of the late General Hardwicke, and those of the Messrs. Reeves, from China.

2465. Do you attribute such donations to the increased facilities of reception and exhibition?—Yes, to a certain extent; and also to an impression that they would be made good use of. As soon as space was obtained, we had a considerable quantity of presents made to us. Indeed a great part of the increase of the zoological collections has arisen from donations.

2466. What is the system of nomenclature adopted in the different departments?—We arrange each department according to the best and most generally received published system of the objects of that department; as, for instance, that of Cuvier for quadrupeds and fish, Temminck for birds, &c.; and we name the species (which are arranged in the genera of these authors) according to the oldest author who has described them, such as Linnæus, Latham, &c. &c.

2467. Is the locality always mentioned upon the specimen when you ascertain it?—Always, and the name of the donor also; but we only give the locality when we have a positive knowledge of it, as much confusion in the geographical distribution of animals has arisen from the want of attention of older naturalists to this particular.

Mr. *John E. Gray.*

21 April 1836.

2468. Is the nomenclature adopted in the Museum the same as that adopted in the Jardin des Plantes at Paris?—Precisely the same; in proof of which I need only refer to Cuvier's "Règne Animal," in which the names given to the birds, for instance, are the same as those on the specimens in the museum of the Garden of Plants. I will open at the first quadruped in the "Règne Animal," volume 1, page 87. The first quadruped which I there find is simia satyrus.

2469. Is that the name applied in the British Museum to the corresponding specimen?—It is.

2470. Mr. *Hawes.*] And it is the term which naturalists of the present day would apply to it?—Undoubtedly. Mr. Owen uses it in his paper in the Transactions of the Zoological Society for 1835, on the osteology of this animal, and it is used by Fischer in his "Synopsis Mammalium," the last published Species of quadrupeds. The second animal in Cuvier's work is "le chimpansé," simia troglodytes. By using these, the oldest names, the students of all the different systems of zoology (both Linnæan and the more modern ones), are enabled to ascertain what animal is intended; as every subsequent author refers, as a synonym or otherwise, to the name given to the animal by its original describer. This system also possesses the advantage of indicating the length of time that the animal has been scientifically known.

2471. Sir *Robert Inglis.*] Is there any work of new nomenclature of birds?—None that I have ever seen, containing anything like an entire Species; there are works on certain genera or orders, or on the birds of certain countries, but no complete work that I have seen in which the new nomenclature is applied to the entire class; so that if what would be called the new nomenclature were to be applied to birds, a very large proportion of the names would be names of the keeper's own formation, and consequently unintelligible except to those who knew as much of the science as himself.

2472. Is there any such work on the reptiles?—There is no complete work. The only works of the kind that are at all approaching to completeness are those formed upon the collection of the British Museum by myself. In the Appendix to Griffiths' Translation of Cuvier's Animal Kingdom, I gave a table of reptiles, and in that table are described all the species of chelonian and saurian reptiles which I had seen. References are there made to the Museum collection for those specimens which I described from it, and since that I have begun a separate work, being a synopsis of the species of reptiles, in which it is my intention to describe all the species that I have seen. A similar work has since been commenced by the officers of this department in the French Museum, which is also now in progress.

2473. Respecting shells, is there any work of new nomenclature?—There is no work on the entire subject except that of Lamarck, which does not contain a very large proportion of the shells that exist in English collections. The whole work is in seven volumes, octavo; there are probably but very few copies of it in this country, and it has never been translated; but by using his genera (which part of the work has been translated), and the Linnæan names for the species, which are given on that system in several English works, we accommodate the arrangement both to the amateur and the student.

2474. The Linnæan nomenclature is that adopted in the collection of shells in the British Museum?—The Lamarckian arrangement with the nomenclature of Linnæus; so that you have the two together, the best arrangement and the most generally received nomenclature.

2475. Mr. *Hawes.*] The names of simia satyrus and simia troglodytes stand quite alone in the Museum; they do not appear as synonymes?—No, they appear as the generic and specific name to the animals, in the same way as on the tickets in the Garden of Plants.

2476. Has not Cuvier in his work placed them under a particular genus?—Yes, under the genus simia of Linnæus, and the sub-genus simia of Erxleben, refering to pithecus of Geoffroy as a synonym of the sub-generic name.

2477. He has not placed them under the genus pithecus?—No, he has no genus pithecus in the "Règne Animal." According to his arrangement he considers them as species of Erxleben's genus simia, and regards Geoffroy's genus pithecus as a synonym of the latter.

2478. Cuvier gives you the more extended nomenclature?—He mentions both names, but properly gives simia of Erxleben the priority; it was published in 1777, and pithecus of Geoffroy in 1812. The latter, too, does not comprehend the simia troglodytes which forms the genus troglodytes (troglodytes niger) Geoffroy.

Mr. *John E. Gray.*

21 April 1836.

2479. What is the proper name of the simia satyrus in Cuvier?—Simia satyrus; and he regards it as a species of the sub-genus simia of Erxleben.

2480. Will you refer to the passage in Cuvier, and read the proper name?—"L'orang outang (simia satyrus, *L.*);" he places it as a species of the sub-genus simia of Erxleben, and merely refers to pithecus as a synonym of this sub-genus.

2481. Whereas in the British Museum it stands as the generic name?—The name simia stands as the generic name.

2482. There is nothing upon the label but the words "simia satyrus"?—Yes; "The ourang outan; simia satyrus, *Linn.*: Borneo, *Sir Hans Sloane*;" these are the words on our ticket.

2483. And there is something more than that in Cuvier's work?—No, there is no other name to the species except the French name; he describes it as simia satyrus, *Linn.* In speaking of the genus, he calls it simia of Erxleben, and refers to another synonym, the pithecus of Geoffroy.

2484. In the Museum is not it the generic name?—No, it is the generic and specific name.

2485. What is the generic name in the Museum?—It is simia.

2486. What do you consider the proper generic name?—Simia, of Erxleben; for it is the custom to use the oldest generic name, and this animal is considered as the type of the simiæ, or apes.

2487. You prefer keeping the oldest name by itself to putting modern synonymes, even though upon the authority of Geoffroy?—It is not a matter of choice, but one of duty to the earlier author to adopt the oldest name which has been given to the genus, and if you use any more modern name, to quote it as a synonym. If you refer to the works in which the canons of nomenclature in natural history are best propounded, you will find this to be the universal rule. Any naturalist, as well as Cuvier, who was satisfied that pithecus of Geoffroy was the same as simia of Erxleben, would use the latter on account of its priority.

2488. Are there any canons of natural history?—Yes; there have been several works on this subject: the best is the "Philosophia Botanica" of Linnæus. De Candolle's "Theorie Elémentaire," and Fabricius's "Philosophia Entomologica," also contain good expositions of the received opinions upon the subject of nomenclature. Those books give you the rules by which naturalists of all countries are governed. The manner in which specimens should be named in public museums is, however, a question which is a great deal agitated among zoologists; and, after the most mature consideration, I believe the one we have adopted in the Museum to be that which is most generally useful to all classes. It might, perhaps, be an improvement to place the modern generic name on the top line of the ticket, or even to place the name adopted by the officers on the ticket, as well as the English name and that of the first describer.

2489. Sir *Philip Egerton.*] You mean that the names which you have attached to the specimens in the Museum are so well known, that by reference to any of the current works of zoology, any person anxious to obtain information would experience no difficulty in identifying the specimen so named?—Undoubtedly he would at once find it; whereas if we used more modern and less known names, as pithecus satyrus, for instance, none but those who had been pupils of M. Geoffroy, or had studied his works, would recognise the animal. Cuvier's book is written in French, and therefore he gives the synonym of a French author, M. Geoffroy, who lectured in the French Museum. The same motive does not exist here, and were we to add such synonymes, they would only confuse the student and the public, instead of giving them what is really useful.

2490. Mr. *Hawes.*] Do you object to giving them information in the same way that it is given in the work from which you quote as authority?—If we added the synonymes of foreign authors, it would not be honest towards an English author, if we did not make similar additions from his work also.

2491. Is there any objection to introducing English synonymes?—No; we give a well-known English name; more than that would be always better explained in a catalogue than in the ticket upon the specimen.

2492. Sir *Robert Inglis.*] Do not you introduce English synonymes?—We give the English name of the species, and the oldest Latin scientific name.

2493. Mr. *Hawes.*] When there is no catalogue, is not it more important to put the name upon the specimen?—It is unnecessary, because we are arranging the specimens with the intention of continuing the catalogues.

2494. If there be no catalogue to the collection of Natural History, is it or is it not

not important to give the greatest possible information on the label?—Undoubtedly. We have various catalogues of the Natural History collections; it is always desirable to give information, but in attempting to give the greatest possible information, you might make the Museum nothing but tickets, which would conceal the animals themselves; upon this very animal, the simia satyrus, it would occupy at least three pages to give the synonymes of reference alone; they actually occupy nearly that space in Erxleben's "Systema," published in 1777, and a vast number of additional references to later works would now be required.

2495. Therefore you think it better to give less than Cuvier does?—Cuvier himself gives no synonyme to this particular species.

2496. Sir *Robert Inglis.*] Have you any catalogue of the divisions of the Natural History department in the British Museum?—Dr. Leach commenced the formation of a series of catalogues in large quarto books, and made considerable progress with the insects, which he principally studied; he also made some little progress with the birds and mammalia. Those catalogues were continued on to a certain extent, until the general collection was removed. Mr. Children made a catalogue of all the species of shells in our collection in 1825; he had a list of shells made out, and marked those we had in the Museum. We have a catalogue of the Cracherode collection of shells, which we received along with that collection, and several others. Since the collection has been removed into the new rooms, we have commenced a new series of catalogues; and all the time that could fairly be devoted to it, after arranging the collection and putting the specimens in order, has been given to it. As soon as the species of any group have been named and arranged, a catalogue has been made of them. Perhaps, however, I should scarcely call them catalogues in their present state; they are rather systematic inventories, which can be at any time readily converted into catalogues. From the mode of their construction they can be easily arranged in any system which it may be thought desirable to adopt, every species being written upon a separate leaf. The reason why Dr. Leach's catalogues were discontinued was that he had entered two or sometimes three species upon one page; and as both sides of the leaf were written on, they could not be arranged in any form that might be desired. I have brought the catalogues of those portions of the mammalia and reptiles containing the bats, lizards and snakes. The catalogue contains a short account of every individual specimen. Each species is marked with a number, which agrees with that on the page of the catalogue which contains the name and synonyme; and every individual specimen of the species is marked with a letter, in addition, which refers to its particular habitat, and any other facts connected with it.

[*The Witness delivered in the Catalogue.*]

No. of Species.	NAME AND SYNONYMY.	Mark of Individuals.	Habitat.	History, Donor, &c.
41	Macroglossus minimus, F. Cuv.	*a*	Java, Horsf.	The Hon. India Company.
	Pteropus minimus, Geoff., Ann Mus xv. 97; Fischer, Mam. 83. Pteropus rostratus, Horsf. Java, iii. t.(*a*) Macróglossa Kiodotes, Lesson. Macroglossa Horsfieldii, Lesson. Kiodote, F. Cuv. Mam. Lithog. Lowo assu, of the Javanese.	*b*	Java.	Gen. Thomas Hardwicke.
13	Gecko fimbriatus, Daud. Thecadactylus fimbriatus, Gray. Uroplates fimbriatus.	*a*	Madagascar	John E. Gray.
4	Clotho arietans.	*a*	Cape Good Hope.	Purchased, 1835
	Echidna arietans, Merr. Coluber Bitis, Bonat.	*b*	Cape Good Hope.	Purchased, 1835.
	Vipera inflata, Burchell, Trav. Vipera brachyura, Cuv. Reg. Anim.	*c*	Cape Good Hope.	W. Shuckard, esq.; dry skin of young, without any head.

Mr. *John E. Gray.*

21 April 1836.

2497. Is such catalogue for the exclusive use of the officers of the Museum, or is it available for the purposes of science by any man of science who may desire to consult it?—It is open to anybody who wishes to consult it for the purpose of ascertaining the history of any particular specimen; but most persons who are desirous of information with regard to the collection, apply either to Mr. Children or myself, and we are commonly able to answer them without referring to the catalogue. When I see any person who appears desirous of making use of the collection for any particular purpose, I usually ask, "Is there anything I can show you?" or if he were to make an inquiry that I could not answer personally, I should refer to the catalogue; or if he were to ask to see it, I should show it to him.

2498. And such facility arises not from any personal acquaintance on your part with the individual or from your knowledge of him, but simply from the desire to make available the stores of the Museum to such persons as may desire to consult them?—Yes; believing it to be the wish of the Trustees that the utmost possible use should be made of the collection. Anybody who makes known to an attendant his wish to see any particular specimen, is brought to me without any kind of introduction, or an application from a stranger made directly to myself, is equally attended to. I may observe that the catalogues are kept for the sake of reference in my own room, because a naturalist cannot examine specimens, for any scientific purpose, contained in glass cases, without having the cases opened, and it would not be safe to open them without the presence of an officer; the catalogue would consequently be of little use to a naturalist, unless when he could have the specimens to examine more particularly than can be done while they remain in the cases.

2499. Mr. *Hawes.*] When was that catalogue commenced?—The new series of catalogues was commenced about two years ago; there was a catalogue of the mammalia previously existing. There is the new catalogue of the reptiles.

2500. When was that commenced?—About two years ago. As soon as the collection was in such a state that the public could make use of it, we commenced that new series, having always felt the importance of having written catalogues of the collection. To show that we have been always anxious respecting the formation of catalogues, I have here a plan for forming catalogues which I drew out in 1825, and submitted to Mr. Children for his approval; it was adopted by him, and upon this plan we continued the old catalogue; but from the necessity of attending to the naming of the collection, much progress was not made in it. This plan was fastened in the first volume of the catalogue of mammalia, in order to explain to any person who used it the mode of its formation, and how it might be continued; it runs thus: "The rules to be observed in forming this catalogue: 1. Every species to have a separate leaf devoted to it, so that at any future time the leaves may be separated and bound in any other form. 2. Every species to have a number attached to it, and every individual specimen of that species to be designated with a letter as well as the number, so that the history, country, &c., of each individual may be recorded in the catalogue. 3. Each part to have a full alphabetical index of synonyma, and a classical index of genera, with a reference to the numbers of the species. 4. The names and references to be arranged in the following order: 1. The older names used before the introduction of the Linnæan nomenclature. 2. The names according to the Linnæan nomenclature. 3. The idiomatic or common names by which the animals are called by the common people of the various parts of the world. 4. Reference to all the figures which can with certainty be referred to each species or variety, with remarks when they are original or from whence copied. 5. Under the head anatomy, a reference to the works which treat or give plates of the anatomy (either myological or osteological) of each species, with a reference to any specimens which may be preserved in the Museum. The catalogue will consequently present three arrangements of the species contained in the Museum, viz.: 1. Historical according to the time of their receipt. 2. Classical, according to the genera. 3. Alphabetical, according to the index."

2501. Sir *Robert Inglis.*] Though the catalogue, of which you have exhibited three volumes, be in manuscript, do you wish the Committee to understand that it is practically open to the inspection of any man of science, known as such, whether he be personally acquainted with you or not?—Yes; not only to every man of science, but to every individual that makes inquiry concerning the specimens, and asks to see the catalogue.

2502. Mr. *Hawes.*] Is it a catalogue made by direction of the Trustees?—Ever since I have been at the Museum I have understood that it was part of the duty expected

expected from me. The Trustees have expressed a great desire to have a catalogue of every department.

2503. Have the Trustees ordered that catalogue to be made for the use of the public?—I always understood that the Trustees wished for a catalogue. I cannot say that the Trustees have ever given me personally any order on the subject, because I do not receive orders immediately from the Trustees; but it is known that the officers are expected to make catalogues of the various collections.

2504. Have you ever received an order from your superior to form a catalogue for the use of the public?—I do not recollect ever to have received any order from Mr. Children on the subject; but I have often talked with him about a catalogue, and he has perfectly agreed with me in the great advantage of it, and in the necessity of its being made.

2505. Have you ever received a direction from your superior in the Museum to frame a catalogue for the use of the public?—If I understand the effect of the question, I should say no. Mr. Children has not said, "I desire you to make a catalogue;" but when I have spoken to him about the formation of catalogues, he has agreed in the expediency of their being made.

2506. Sir *Robert Inglis.*] And such catalogue, so made, is for the use of the public, whether it be kept in manuscript or whether it be printed?—Undoubtedly.

2507. And it is not at all considered your own private property, the use of which you may refuse to a student in zoology, if he make an application to you for it?—Certainly not; I never considered the catalogues as my own private property; they belong to the Museum. The catalogues (both old and new) remain in my room, and those that I am working upon often lay on my table; any person that comes into the room may take them down or look at them.

2508. Mr. *Hawes.*] Do you mean to say that you, as an officer of the Museum, are bound to produce the catalogue?—I have never refused to do so.

2509. Is it a rule or not?—I do not know that there exists any rule to that effect.

2510. Is it not, more or less, a matter of obligation that you accommodate any person that asks you?—I do not consider it so. I should consider it my duty to show it to any person really desirous of obtaining information.

2511. Has any person that requests the use of the catalogue any reason to suppose that he is not asking a favour?—If he were to say, "Am I asking a favour?" I should say "No," but I should not encourage those, (of whom there are too many), who come often on the most trivial occasions, and occupy the time of the officers with frivolous questions.

2512. Is there any rule by which the public know that they have access to the catalogue of the specimens of natural history?—I cannot refer to any regulation existing, nor do I think it desirable; something must be left to the discretion of the officer, or his time would be entirely occupied by triflers and idlers. The Trustees will determine whether this discretion is rightly exercised.

2513. Sir *Robert Inglis.*] Practically, do men of science in England, who come to the Museum, know that there is such a catalogue, and knowing it, have they the means of consulting it?—They have; it is placed in my room. Some of the volumes are conspicuously lettered.

2514. Mr. *Hawes.*] Do you mean to say that all men of science know that there is a catalogue?—I cannot answer for what all men of science may know, but if a man of science or any other person desirous of information comes to me and says, "Is there a catalogue?" I tell him that there is. Very commonly, however, I can give the information wanted without referring to a catalogue.

2515. Are you aware that several of the witnesses before this Committee, who have the reputation of being men of science, have said that they were not aware that there was such a catalogue?—They never asked for one, or I should have shown it to them. I suppose that they never felt the necessity of consulting a catalogue.

2516. They cannot ask you for that of which they do not know the existence?—One would suppose that if they wanted a catalogue, they would come and ask for it.

2517. Sir *Robert Inglis.*] Do you know any collection on the Continent in which there is a perfect catalogue?—I do not, of any general Zoological collection. I know that the officers of the Berlin collection proposed to print a catalogue, or rather list of the species in the Museum, about 20 years ago, but it has not yet been published. Here is the catalogue, or rather systematic list, of the reptiles in the

Mr. *John E. Gray.*

21 April 1836.

museum at Vienna; but it is not published by the museum itself; it is published by the officer who has the charge of that department, who printed a new system of reptiles, at the end of which he has given a list of the species in the collection.

2518. Mr. *Hawes.*] But it is printed and published?—Yes.

2519. And is to be bought?—I cannot say; he sent it to me as a present.

2520. Is there a bookseller's name to it?—There is.

2521. Sir *Robert Inglis.*] Will you state whether this be a catalogue of an actual collection or a classed catalogue?—It is a catalogue of the species in the collection; or rather it is a mere list, for the purpose of illustrating the new system of the author.

2522. Do you know the catalogue of the collection of the College of Surgeons?—Yes, I know it very well.

2523. Will you state what proportion a catalogue of the collections in the British Museum, completed upon that plan, would bear to the catalogue so far as already printed, of the collection in the College of Surgeons?—There are 870 individual specimens described in the part of the catalogue of the College of Surgeons which relates to systematic natural history; and we have of reptiles 600 species and about 1,300 individuals; of mammalia 400 species and 700 individuals; of shells 4,000 species and 20,000 or 30,000 specimens; of radiata 750 species and more than 2,000 specimens; and of insects probably more than 20,000 species and 60,000 or 70,000 individuals. A catalogue, continued upon the same plan and style as that, would certainly occupy 50 or 60 large printed quarto volumes.

2524. It has been stated by Mr. South, in answer to questions 757 and 758, that he believes it is not generally known to scientific men that there are accurate catalogues in manuscript, and that he has not himself referred to such a catalogue nor heard of it. Can you state to the Committee what opportunities Mr. South may or may not have had of consulting such catalogue or of forming such an opinion?—Mr. South frequently comes to the Museum, and sometimes asks me to point out to him such specimens as he is desirous of having figured; but he never asked me for a catalogue. He has been in my room, and if he had looked at the case directly opposite to the door, he might have seen the catalogues there: they are all in the case conspicuously lettered "General Zoological Catalogue."

2525. Mr. Richard Owen stated that he was not acquainted with the existence of a catalogue of any division of the Zoological department in the British Museum. Has Mr. Owen any particular opportunities of coming to this conclusion?—When Mr. Owen was forming his catalogue of the College of Surgeons, he brought specimens of which he was desirous to ascertain the names (the names not having been given when Dr. Shaw formed a catalogue of the Zoological collection in the College of Surgeons), but he never asked for a catalogue.

2526. Did you keep back from Mr. Owen, or from Mr. South, or from Dr. Grant, the knowledge of the fact that you had such a catalogue?—Never; when Dr. Grant said, "Have you a catalogue?" I showed him the catalogues immediately.

2527. Has Dr. Grant consulted any specimens in the Museum?—I do not recollect his having ever consulted more than one. He came to look at the animal of Spirula, and wished to take it home to examine. I told him that it was against the rules of the Museum; that he could have every facility for its examination in the Museum; but I could not allow it to go out. He went away without examining it further, because, as he stated, he could make no use of it there; he could only work in his own room.

2528. Did you take it from its position in the Museum and place it in your own room, for the purpose of being examined by Dr. Grant?—I did, and offered him every facility, such as glasses, needles, &c. I do not know that he has ever consulted any other specimen until he came to the Museum to prepare himself to give evidence before this Committee; since that time I have seen him often in the Museum, two or three hours a day each public day, for several weeks together.

2529. Mr. *Hawes.*] You stated that you thought scientific men generally knew that there was a catalogue?—I mean systematic zoologists; Mr. South, Dr. Grant, and Mr. Owen are comparative anatomists, and therefore they would not need a catalogue of that kind; whereas Mr. Bell, Mr. Bennett, Mr. Yarrell, Dr. Richardson, Mr. Gould and all practical zoologists, I believe, are aware of it, because they must have seen me use it.

2530. Sir *Robert Inglis.*] Referring again to the catalogue which you exhibited, by Fitzinger, under the date of Vienna, 1826, will you state whether it be a complete

complete catalogue of an existing collection of a particular div sion in natural history, or a specimen of a classification of that division?—The title is "Neue Classification der Reptilien," and the object of the author was, I believe, to publish a new arrangement of reptiles. Having charge of a museum, he has given a list of all the specimens in that collection, which formed his materials for the book, to show in what genera they ought to be placed according to his system.

Mr. *John E. Gray.*
21 April 1836.

Martis, 26° die Aprilis, 1836.

MEMBERS PRESENT.

Mr. T. G. B. Estcourt.	Mr. B. Baring.
Sir Robert Inglis.	Mr. Marshall.
Mr. Hawes.	Mr. Ridley Colborne.
Sir Philip Egerton.	Mr. Thorneley.

MR. T. G. B. ESTCOURT, IN THE CHAIR.

Thomas Horsfield, M.D. called in; and Examined.

Thomas Horsfield, M.D.
26 April 1836.

2531. Sir *Robert Inglis.*] YOU are a Fellow of the Royal Society, and member of the Linnean Society?—Yes.

2532. Have you the charge of the collections of natural history at the East India House?—I am at present employed in the museum of the East India Company.

2533. You are also the author of "Zoological Researches in Java," &c. &c. and of a systematic catalogue of the Lepidoptera in the museum of the company?—Yes; the former relates almost exclusively to Java.

2534. When you were in Java, you formed a very considerable collection of natural history?—Yes; of nearly 17 years which I passed in Java, a large portion was devoted to researches and collections in natural history.

2535. How long have you known the natural history collections in the British Museum?—I have known them from my first arrival in this country, in the year 1819. When I came from Java I was introduced to Dr. Leach, who was then the zoologist; having attended to the various departments of natural history, I engaged his assistance in several divisions of zoology. My first essay was a general systematic catalogue of the birds collected in Java, which was published in the Linnean Society's Transactions; it was in a great measure prepared in the Museum, under the immediate eye of Dr. Leach: and I may say that from him I received many of those general views in science, which I have found of great advantage in prosecuting my researches subsequently.

2536. Will you state what was the condition of the British Museum, in the department of natural history, at the time when you first became acquainted with it, as compared with its present state?—As far as I recollect, the only important part of zoology at that time was the series of British birds; to these considerable attention had been paid. As far as regards the mammalia, and birds of other countries, the collection in the Museum was at that time extremely defective; so much so that I paid very little attention to it, as it did not afford me any information.

2537. Has that deficiency been supplied since the period to which you have referred; and can you state, if so, whether such increase has been in proportion to the increased space allotted to the exhibition of the natural history collections?—Perhaps I am not prepared to state accurately the history of the collections; as far as I recollect, they were stationary for some years after my arrival: but within the last six or eight years, I have observed a steady and regular increase in them; and I think this increase has not only been in proportion to the space previously existing, but that an attempt has been made to employ the space which the building successively afforded to every possible advantage.

2538. Are you acquainted with any Continental museums?—I have seen the museum in Leyden.

2539. Will you state to the Committee what is your estimate of the relative

Thomas Horsfield, M.D.

26 April 1836.

rank of the Zoological department of the British Museum, as compared with the corresponding department in the museum at Leyden?—That I must confess is rather a difficult question; I can only compare with any Zoological department in Leyden, the mammalia of the British Museum. When I was in Leyden, the collection of birds, which is very extensive, was not exposed to public view; but in regard to mammalia, I can say, generally, that the collection in Leyden was much more extensive than that in the British Museum; but the relative proportion of its extent I cannot state.

2540. In what year did you see the collection in Leyden?—In 1831.

2541. Has there been a considerable increase in the collections of natural history in the British Museum since 1831?—I think there has been a very remarkable increase in the collections since that year; if I recollect right the effort to which I have alluded was in full progress at that period.

2542. Are you aware whether about that period the new buildings were opened for the exhibition of objects?—Yes, they were opened.

2543. Then the increase in the collection has been in proportion to the space allotted to the exhibition?—That is my impression. It is perhaps a point upon which I am not prepared to answer precisely. I should request permission to state, that the answers I give are necessarily very general. I have not had the opportunity to consider the subject in such a way as to give perfectly accurate answers to these questions.

2544. The Committee do not wish you to give a numerical statement of the increase, but your general impression, as a man of science, from the pretty frequent examination which it is assumed you have made of the collections in the British Museum, and the examinations you have occasionally had of the museum at Leyden?—My general impression is as above stated.

2545. Mr. *Hawes.*] Will you favour the Committee with the result of that comparison of the British Museum with Leyden?—The result of that comparison is, that the collection in Leyden is much more extensive than the collection in the British Museum.

2546. Can you speak also as to its value in a scientific point of view?—The value of a collection is in some measure connected with its extent. I should observe that the government of the museum in Leyden is, as far as I know, probably as perfect as that of any other public institution of a similar nature. There is on the part of the government in Holland a very remarkable interest displayed; the King himself is competent to judge of what ought to be done: and Holland, for a country of so small an extent, has devoted resources which, in comparison with the resources supplied in this country to similar objects, are really astonishing.

2547. Sir *Robert Inglis.*] Are you able to state what is the amount allotted by the government of Holland to the museum at Leyden?—No; I only judge from the establishment, and from the assistance afforded by the collectors in different countries. When I was in Leyden there were various travelling naturalists in all the colonies of the Dutch.

2548. Were those travelling naturalists employed by the state?—By the state.

2549. When you speak of the establishment at Leyden being very large, are you prepared to state what is the force of that establishment, or is it a general impression derived from the number which you saw?—It was rather derived from a general impression of what I saw; I must confess I am not prepared with minute details to enable me to give a satisfactory statement upon that subject.

2550. When you spoke of the extent of the collection in Leyden, were you speaking of the mammalia alone?—I was speaking of the mammalia alone.

2551. Can you state to the Committee whether the collection at Leyden be or be not local, in the sense of its riches being principally derived from the colonies, with which the Dutch have almost exclusively intercourse, or is it a general collection containing specimens from all quarters of the globe, without special reference to any one country more than to another?—The nucleus of the collection in Leyden, I believe, is derived principally from the colonies of the Dutch; but there is carried on in Leyden, a general system of exchange of duplicates with all the continental museums. The director travels, with the view to increase the public collections, and has during the last three or four years visited almost every country in Europe. He has been to this country, provided with duplicates for exchange; he has visited Berlin, and I believe Vienna. He is perfectly acquainted with every museum of any extent on the continent; from each of these different museums he has

has obtained objects which were required in Leyden to complete the collections. The general view, and I believe the only, which the director of the museum in Leyden possesses, is to form a collection complete of its kind; no naturalist with general views, is satisfied with anything short of a complete series. Every individual species is important in a collection, and ought to form part of it; and I believe it is the object of the director of the Leyden museum to complete his collection.

2552. Mr. *Hawes.*] Has he made any exchanges with the British Museum?—That I do not know.

2553. Sir *Robert Inglis.*] Can you state what is the condition with respect to preservation, and with respect to arrangement of the collections in the British Museum. Is it such as you, looking at them as a man of science, would desire to see?—From the examination which I have made, I am prepared to say that the state of preservation generally, of the specimens in the Brisish Museum, is excellent. There may be some exceptions; but the principal collection, namely, that which is deposited or secured in cases, I believe to be in a very entire state of preservation; I have not observed any material defect.

2554. With respect to the classification, what is your opinion?—The classification is very simple; the specimens are arranged, as far as possible, according to the system of Cuvier; there are necessarily some interruptions in the series, but I believe it is sufficiently perfect to afford effectual assistance in study.

2555. Looking at the limited space still allotted to particular divisions, and looking to the buildings now in progress, do you consider that any defects in the arrangement, or any hiatus in the collection may be attributed to the want of adequate space, or if not, to what other cause?—If I look at the collection as it now stands, I do not see the means of extending it in its present locality. If the Committee wish me to state what alteration ought to be made in any new building, I am not prepared to state it; the present deficiency is, in my opinion, chiefly attributable to the want of space.

2556. Mr. *Hawes.*] Will you state what provision in your opinion you think it is requisite to make in the new building, for the collection such as you now see it, and such as it may become in the course of years?—That question is somewhat difficult. If I were to give my opinion it is this, that the duty of the general direction of the Museum is to supply a complete collection. It might require some calculation to determine what space that would require; it would be a very considerable space; a very large room, and a well lighted room. I am not prepared to state what the extent of the room would be, but it would be very considerable for the collection.

2557. Sir *Robert Inglis.*] In the answer which you have just given, you used the word "collection;" to what do you refer under that term?—The collection of mammalia; whatever I have said applies to the mammalia alone. I wish particularly to say, that except the idea be acted upon of affording a complete collection and of supplying a complete series of natural objects; except that idea be acted on, any attempt does not reach the object which I thought should be kept in view.

2558. As an author, known by the publication of various works of science, have you experienced such facilities as you desired to find in consulting the collections in the British Museum?—In reply to that question, I can state, that as far as regards myself, I have experienced every possible facility. It may, perhaps, in some measure arise from the habits of friendly intercourse in which I am generally engaged in other societies, with the officers of the Museum.

2559. When you refer to yourself, and to the habits of personal intercourse which subsist between you and the officers of the Museum, did such personal intercourse exist when you first entered the Museum as a visitor;—were you personally acquainted with Dr. Leach for instance, when you first entered the Museum?—I was introduced to Dr. Leach, immediately upon my arrival; I formed an acquaintance, very nearly at the same time, with the superintendent of the department of Natural History. I subsequently became personally known to every officer, I believe, of the Museum, in this department.

2560. Have you reason to think that men of science, coming as strangers to the Museum, have or have not facilities for prosecuting their studies and researches there?—As far as I have observed, I believe there is on the part of the officers of the Museum every possible disposition to facilitate scientific inquiries, examinations, and comparisons of natural objects, to the fullest extent that the nature of the Museum allows.

2561. Have you experienced such facilities in England as you have experienced

Thomas Horsfield, M.D.

26 April 1836.

at Leyden, for instance?—I think I can state with truth, that the facilities are the same; and in saying that I can only state that my visit to Leyden was occasioned by an invitation from one of the professors, and of course every readiness was shown to make my visit pleasant; whenever I have had occasion to consult the British Museum, I have observed the same disposition.

2562. As a man of science, in consulting the collections of the British Museum, have you reason to desire anything which you do not find?—Not so far as the disposition of the officers is concerned; in that point of view I am perfectly satisfied.

2563. Will you explain whether, by that expression, you desire the Committee to understand your answer as limiting the facilities which you have enjoyed to the personal conduct of the officers, as contradistinguished from any regulations in the establishment; as if the officers had contravened the regulations of the establishment in affording you any facilities?—My answer does not mean to intimate anything of the kind; it is merely relative to the nature of the collection.

2564. Then if the collection were larger you would, under the same system, receive greater facilities in consulting the collections in the prosecution of your works of science?—That is my view.

2565. Are you prepared to state to the Committee any observations with respect to the extent, condition and arrangement, of any other division of the Natural Hit ory department of the British Museum, other than the mammalia, to which your previous examination has been chiefly confined?—I am perfectly prepared to state, that as far as I have observed, very particular attention has been paid to ornithology; and although I have not examined the British Museum with a view to give a perfect analysis of it, yet as far as I have observed latterly, I think the collection of birds is, in a zoological point of view, perhaps the most perfect part of the collection; the whole of that collection has been formed within the period first mentioned by me, the last six or eight years.

2566. Mr. *Colborne.*] When you spoke of the great superiority of the collection at Leyden, did you refer to the collection generally, or only to a certain department of it; for instance, specimens from Japan, and those countries which they are particularly conversant with?—The remark related to the mammalia generally from all countries; I believe that by the means of exchange which the Dutch have had from the accumulation of materials from their colonies, the collection is nearly equally rich in objects from every part of the globe.

2567. Would you say, as applied generally to specimens from other parts, that the Leyden collection is greatly superior to that of the British Museum?—The Leyden collection of mammalia is, I may say, greatly superior.

2568. Upon ornithology?—Upon ornithology, I have stated that the collection was not exposed. It is well known to naturalists, that the ornithological collection of M. Temminck, which was purchased by Government, was considered as the largest in existence; but that was not exposed to view.

2569. Sir *Robert Inglis.*] Are the Committee to understand that that collection is not exhibited to the public?—It was not exhibited when I visited Leyden, no room had been provided for it, and it was provisionally deposited in boxes.

2570. Then, when you speak of the extent of the collection of Leyden, do you or do you not include the part not exhibited, as well as the part exhibited?—In what I state I wish to limit my remarks exclusively to mammalia.

2571. With respect to the entomological division of the British Museum, can you state what rank it holds in your judgment, as a man of science, compared with any other collection which you know?—When I arrived in this country the entomological collection was very deficient, exclusive of the British collection, which at that time was perhaps nearly as extensive as it is now; but within the period alluded to, within the last six or eight years, very considerable additions have been made to the foreign entomological collection; but I am sorry to say that it is still very inconsiderable. The foreign collection consists of about 10,000 species, which, for an entomological collection, is by no means considerable.

2572. Is there any other division of the Natural History department respecting which you can give an opinion to the Committee?—No; I have limited my researches latterly exclusively to mammalia, to birds, and to insects.

2573. You would not consider that the Zoological department of the British Museum is "miserable in funds, miserable in science, and miserable in materials?" —No, I have not that impression; in fact, there is a mixture of ideas there which I confess, in my mind, is not logically correct; I mean the expression "miserable in funds." With regard to the idea of its being miserable in the other points, I

must

must confess that that is not my impression. I think the collection of mammalia in the British Museum is, upon the whole, respectable. I think the collection of birds is very instructive and very well arranged. With regard to the provision of funds, that is a subject upon which I do not wish here to offer an opinion.

2574. With respect to the nomenclature: what is your opinion of the system adopted in the British Museum, and of the extent to which that system has been carried, by naming, or leaving unnamed, the general collections. Do you approve of the system of nomenclature adopted in the Museum with respect to the mammalia?—It is always desirable to make a public collection as instructive as possible; and therefore if a system of nomenclature is adopted which is generally understood by scientific men, I think it is highly proper. And from the observations which I have recently made, without pretending to be able to give a critical statement, I should suppose that the nomenclature is sufficient for the object, though I have no doubt that improvements might be made. In fact, nomenclature is a progressive subject; it is not stationary; and it is the duty of the officers to accommodate it to the gradual increase of science.

2575. Mr. *Hawes*.] Is it so accommodated in the British Museum?—To render the collection instructive, it is desirable to adopt the nomenclature which is generally known; and, as far as I have observed, I think that has been the object of the officers.

2576. Is it accommodated to the present state of science?—Yes; it is the nomenclature of the Règne Animal of Cuvier. It is not for me to state to the Committee what are my particular views of nomenclature, because that is a scientific question not connected with this examination; my own views are in some measure different; but for a public collection I do not think a better system of nomenclature could be adopted in regard to the mammalia.

2577. And it is perfect according to the system?—Upon the whole I think it is. Perfect is a strong expression, and I would rather modify it by saying that it is correct; to say that it is perfect is more than I can do.

2578. You have stated that the system of Cuvier is adopted?—I think it is generally. The assistants in the Zoological department have informed me that in the arrangement of the mammalia they had followed, as far as the localities allowed, the system of Cuvier; and I believe, taking that as the basis of the arrangement, it may be stated, with perfect truth, that the nomenclature is tolerably correct.

2579. But you are now speaking from the information of the Officers?—And my personal inspection.

2580. Sir *Robert Inglis*.] Will you state to what extent you find objects of natural history without names; that is to say, how far the nomenclature adopted is applied to the collection generally?—I am scarcely prepared to answer that question; I believe that there is a progressive operation going on at the Museum to supply the names, and that a very large proportion is named, but what part remains unnamed I have not ascertained by examination.

2581. If it were said that the collection in the British Museum is for the most part without either classification or nomenclature,—is that a description that you would apply to the collection?—By no means; I believe that at the present period there is every disposition in the assistants in the Zoological departments, to give every information by means of the collection that it is capable of.

2582. Mr. *Hawes*.] Have you been in the habit of frequenting the Museum much?—Not latterly; my pursuits at present relate to entomology. I have been there occasionally during the last year, to make some comparisons.

2583. You have the care of the entomological collection at the India House?—I have.

2584. When did you first take charge of that?—Upon my arrival in this country, in the year 1819.

2585. Immediately upon taking charge of that, did you proceed to make an accurate catalogue of the contents of the collection?—The first object was to arrange it; and subsequently I commenced a catalogue, which is still in progress. One of the works which I have undertaken, is a systematic catalogue of one department of the insects.

2586. The catalogue is not complete?—It is still progressive. In fact, my attention has been devoted latterly to other duties both in the Museum and library, and I have therefore not completed it.

2587. You are acquainted with Mr. Vigors?—I am.

Thomas Horsfield, M.D.

26 April 1836.

2588. Would you consider him high authority upon ornithological subjects?—I would. Indeed I have had the honour to be associated with him in the preparation of a paper published in the Linnean Society's Transactions, on the birds of New Holland, and which, although my name is associated with his, the larger proportion of the paper was written by himself.

2589. Two answers of his will be read to you, and your opinion will be requested upon them in opposition to the answers you have already given to Sir Robert Inglis. He was asked, "In the Zoological collection is there any one department more deficient than another?" His reply is, "I think the mammalia are the most deficient." The next question is, "With regard to the collection of birds?" His reply is, "The collection of birds is rather poor compared with others. It does not contain, I suppose, the one-third it might contain, had it adequate funds, by purchase and judicious exchange. I dare say in the course of six months the British Museum might treble the numbers of the species of birds it has at the present moment." Will you now favour the Committee with your opinion upon that latter answer?—I beg the Committee to keep in view that I wish to speak only of the mammalia, the birds and the insects. I have not looked at the other departments, and therefore there is some difficulty in this case. I think the collection of mammalia consists of 400 species; I have given my opinion upon that generally. Now I consider that the collection of mammalia should embrace at least three times that number; the collection of birds, I am informed, consists of 2,000 species; if I take that comparatively with the number of birds known, in that point of view it is richer than the collection of mammalia. May I be allowed to repeat what I have said, and to add in explanation, if the British Museum contain 400 mammalia, this, comparatively with the species known, is a small number. If the collections contain 2,000 species of birds, this, proportionally with the species distinctly known and described, is greater. If the statement be correct, the Museum is proportionally richer in birds than in mammalia; this is the only answer I can give to this question. Therefore I do not agree with Mr. Vigors, in my comparative estimate of the mammalia and birds contained in the British Museum; but I beg it may not be considered that I have expressed a decided different opinion from Mr. Vigors. With respect to nomenclature, I entirely agree with Mr. Vigors—I have adopted his nomenclature; and I hope the time will arrive when the British Museum will adopt it, because, in my opinion, it is much more perfect than that now in use. If it were in my power, I would direct the arrangement of the collection of birds according to Mr. Vigors's system.

2590. Mr. *R. Colborne.*] How many species of ornithology are known?—I am not prepared to give a precise answer; I should suppose about 4,000 are accurately described; some collections may perhaps contain more; but my idea is, that comparatively the ornithological collection is richer than the collection of mammalia, because if there are 2,000 species of birds in the Museum, it possesses nearly one-half of the species known in science, while it only possesses one-third of the species of mammalia.

2591. Sir *Philip Egerton.*] According to your answer, it is impossible that the British Museum could, in six months, treble the number of its collection of birds?—That is a subject upon which I am not prepared to answer. If my views were required upon that subject, I would endeavour to give them.

2592. Mr. *Hawes.*] Then, if Mr. Vigors has informed the Committee that in respect to the Zoological collection "it is generally deficient in all the departments; in some of the higher departments it is particularly deficient; it is deficient, for instance, in the mammalia; it is also very deficient in the birds;" you differ from Mr. Vigors in your opinion of the collection of the British Museum?—That is another view again; with reference to views of science, I believe I agree with Mr. Vigors. I have expressed, in a former part of the evidence, that the design of the government or management of a collection ought to be to make it complete, and that no collection is really valuable till it is complete; by which I mean, that it has not reached that point of excellence, which should be the aim of its direction or governing body.

2593. Sir *Robert Inglis.*] If the number of species of birds known be 4,000, and the number of species existing in the British Museum be 2,000, and a witness should state that in the course of any given period the British Museum might treble the number of the species of birds, such opinion in your judgment would, of course, by the very terms of it, be incorrect?—It is perhaps not quite correct; but it is difficult, in the position in which we are placed, to avoid giving answers in

Thomas Horsfield, M.D.

26 April 1836.

which there may not appear some absurdity. My views, I must confess, are very large; my views are, that there should be an attempt by the management of the British Museum to afford a complete collection of natural history. Something has been said of expense; in my mind the cost is no consideration. It is the duty of the Government to supply such sums as will afford a collection, whether it be 500 *l.* a year, or 1,000 *l.* a year, or 2,000 *l.*; whatever is necessary to complete the collection should be afforded by the Government, if it possess those resources which this country does possess.

2594. Mr. *Hawes.*] How do you know that there are 2,000 species of birds in the Museum?—Partly from the information of the assistants in the Museum, and partly from actual inspection; from the general view I have taken, there is a very respectable gallery. It is possible, I conceive, that in that gallery 2,000 species may be contained; but it is a precise question as to number which can be easily ascertained.

2595. Sir *Robert Inglis.*] When you say that a collection is not valuable till it is complete, do you wish the Committee to understand that in your judgment any collection of natural history is ever likely to be complete, whatever may be the political power and pecuniary resources of the country to which such collection may belong?—Perhaps the expression was not quite correct. My general idea is, that if the directors of any public institution appear to be disposed to rest satisfied with the extent of their collection, I ask, "have you everything which can be obtained?" and till that is the case, I say it is not what it is desirable it should be.

2596. Mr. *R. Colborne.*] When you speak of 2,000 species of birds in the British Museum, and 4,000 being in existence, you only mean that these numbers approximate to the fact?—Yes.

2597. Does any year ever pass without a great number of new species being discovered?—The discovery is progressive. There are at present hundreds of naturalists employed in every part of the world. It is an object interesting to governments as well as to individuals. Many persons pursue natural history for lucrative purposes; others pursue it for amusement; others have a higher object—indeed the highest object possible, namely, that of becoming acquainted with the design of the Creator in the formation of the animal kingdom.

2598. Then a collection can never be complete?—No, it is like all human things, there is nothing complete; there is a progression in all our efforts; and my idea is that we should never suppose a collection to be complete from its extent. A public collection of natural history should always be in a state of progression.

Mr. *John Edward Gray*, called in; and further Examined.

Mr. John E. Gray.

2599. Sir *Robert Inglis.*] IT has been stated, in answer 361, that the witness (Thomas Bell, esq.) had received an impression that Dr. Leach's names had been either removed entirely or altered; will you state to the Committee how far that answer corresponds with your view of the fact?—I will speak first of the shells; when the British collection of shells was purchased of Colonel Montagu, Dr. Leach was engaged upon a work on the shells of the British islands, in which he proposed to introduce a new arrangement, he consequently formed a great number of new genera, and described many new species; his arrangement was not, however, made public, and consequently was not understood by scientific men, and the names attached to those shells were therefore names applied in Dr. Leach's own manuscript; for this reason all such names have been dropped, and the names used by Montagu and other writers substituted in their place. The case is nearly the same as regards the British birds, and especially the foreign shells. I believe those were the only three collections which Dr. Leach had named (exclusive of insects and crustacea). Presuming, however, that Dr. Leach's names might at some future time become valuable by the publication of his manuscripts, they have in almost every instance been written on the back of the board, for future reference; and we have been particularly careful where the species which he had named was new, and had not been before described. Regarding myself as a pupil of Dr. Leach, I have naturally felt anxious to do everything for his credit that could possibly be done.

2600. Whatever then be the value, in a scientific point of view, of the nomenclature adopted by Dr. Leach, that value is not lost to the collections of the British Museum at the present time?—Certainly not.

2601. Do you deem it important that the scientific name together with the foreign

Mr. *John E. Gray.*

26 April 1836.

foreign name, that is to say the trivial name of the object in a foreign language, should be attached to the specimens in the British collection?—I do not think it necessary to add the foreign name; and I think it would be perfectly useless with regard to foreigners, because every scientific foreigner is acquainted with the Latin name.

2602. In the Continental museums with which you are acquainted, are the specimens exhibited marked with the trivial name in the language of the respective country as well as with the scientific name?—Generally; but I never knew an instance of any museum having the name in any other modern language except that of the country in which the museum was situated.

2603. In the Continental museums the specimens have attached to them the scientific name and the trivial name of the country in which the museum is situated?—Yes.

2604. And not of any other language than that of the country to which it belongs?—In no other language: they have it in Dutch at Leyden, and in French at Paris; but I do not recollect any other instance of a name of the kind.

2605. Is it the custom in the Museum, and, if so, do you consider it to be a correct system, to name specimens by groups according to the genera?—We always name them by groups; if I am engaged on reptiles, for instance, I take up the group of tortoises or the group of lizards; this is the only way in which collections can be correctly named, because you have then the power of going through an entire group, comparing one species with another, and making out what are the best characters for their distinction; and much time is thus saved, and a greater facility in determining the species acquired.

2606. With respect to the nomenclature adopted by Dr. Leach, have you reason to believe that he subsequently made any alterations in it after he himself left the Museum?—After he had left the Museum he returned and went through the collection of shells, and having in the interval made (or proposed to make) numerous alterations in his manuscript, he scratched out a great many names, and put other names in their place; he frequently changed the names, which he thought he had a right to do, as his manuscript was not yet published. I have not seen the manuscript, and therefore I cannot say which names he retained there.

2607. You know the catalogue of the collection of the College of Surgeons?—I do.

2608. Would you describe that as a catalogue of individual *specimens*, while a catalogue of a zoological collection generally would be a catalogue of *species*?—There is certainly a marked distinction between a catalogue of individual specimens of comparative anatomy and a catalogue of a zoological collection. In the one you need only give the name by which the species is known, that single name which conveys to all scientific men a knowledge of the object to which you refer; whereas if you describe an object of comparative anatomy (unless it be something extremely common), it is necessary to give a full description in order to show both what it is, and what it is intended to illustrate. In fact, in the catalogue of a zoological collection it would only be necessary to give the names of the species. I have here examples of what I mean; here is a catalogue of the shells of M. Menke —[*producing the same*]—and containing merely a list of the scientific names. Here is also the catalogue of the Tankerville shells, formed upon the same plan, and containing all that is necessary to inform the man of science as to the contents of the collection.

2609. In the catalogue of the Menke collection, is there any description of the species?—No, except of a few new species which had not previously been described.

2610. In your judgment, would a corresponding catalogue in reference to the specimens in the British Museum be likely to be a popular and saleable work?—By no means.

2611. On the other hand, if you made a detailed catalogue, including a description of the specimens, can you state to the Committee what time, and what extent of work, in the form of printing, would be required to produce such a descriptive catalogue?—A very considerable time, judging by what I recollect Mr. Owen to have said upon the subject; I think the kind of partial description which he recommended would, as regards the insects alone (supposing them to amount to 25,000), take 18 years for an individual to accomplish.

2612. Mr. *Hawes.*] Supposing six individuals were employed?—Then of course it would take three years, reckoning about 250 working days in the year.

2613. Sir

Mr. *John E. Gray.*

26 April 1836.

2613. Sir *Robert Inglis.*] Can you state to the Committee what time Mr. Owen was employed in cataloguing the specimens, 870 in number, contained in the volume of the collection of the College of Surgeons, which is upon the table?—I think he stated it to have occupied much of his time for three years; and it is to be observed that 614 specimens belonged to the collection made by John Hunter, in naming which he had the advantage of a catalogue made by Dr. Shaw, who was employed by the College of Surgeons to make out a catalogue of all the specimens of natural history in the Museum, soon after it came into their possession.

2614. Did Dr. Leach print a catalogue of the British birds?—In 1816, soon after the collection of British birds was arranged, Dr. Leach printed a catalogue of it in quarto, and a list of desiderata at the end; but so little notice has been taken of this catalogue, that I have been using the utmost exertions among my friends to obtain a copy of it, and I cannot find that any one of them has kept it.

2615. In your judgment, such a catalogue would not be a popular and saleable work?—By no means; it may be useful to the few working men, in order to show them what we have, but they would quite as soon find out whether we had any particular object by looking at the specimens, as by looking through such a catalogue. It could be of no use to any other persons.

2616. Supposing there were in the Museum an unlimited command of men of science to make a catalogue of the existing collection, would you, in the existing state of the Museum, consider such an object desirable?—I should say, certainly not, in the existing state, nor until the collection is removed to the place where it is likely to remain permanently.

2617. In other words, regarding the collections in the Museum as at this moment in a transition state, you would not think it desirable to publish, or even to form, a regular catalogue till the whole can be arranged in the new localities?—Certainly not.

2618. Are you aware of any perfect systematic catalogue of any one large class in any other museum?—I am not.

2619. If such a catalogue were formed of any one large class, would it in your judgment be perfect unless it also recorded the desiderata?—It is very difficult to determine what are desiderata in a catalogue of that kind, because to do this, you should compare specimens with those of all other museums, the same species being often described under several different names; and unless you can make such comparisons, you cannot say either that such are really desiderata, or that they are the only desiderata you require; to execute such a work properly in any one department, would require the exertions of an individual for years, and in the end it must be comparatively an imperfect work. Such a work, however, ought not to be regarded as the work of the Museum, it should of course be regarded as the work of the person who had taken so much trouble in its completion, and who would deserve to have the recompense of standing forward as the author of his own work. There have been various attempts at such works, which are the best kind of catalogues, a systematic arrangement, namely, of one entire class. Here is, for instance, a systematic arrangement of the mammalia; but although this work was published only in 1829, there are already a great number of additions that might be made to it. I speak of Fischer's Synopsis Mammalium, published at Stutgard, which is a catalogue compiled from all the descriptions of the mammalia of every collection with which he was acquainted.

2620. That catalogue appears to have been published in the year 1829?—Yes.

2621. Did it represent fairly the state of knowledge of the science at that time, and can it be said fairly to represent the state of knowledge now?—The author, Dr. Fischer, was not a practical zoologist, and his work is chiefly a compilation, but carefully executed. It represents all that he could then get together, but we have now descriptions in this country of at least a hundred species, which are not contained in his catalogue.

2622. Then such a catalogue must be perpetually in progress?—Yes; we have at least 50 species of quadrupeds in the Museum, which are not noticed in it; and probably 12 or 14 genera of which he knew nothing.

2623. Has there been formed and published any catalogue of the collection in the natural history department in St. Petersburgh?—If there is any I have never seen it.

2624. Has there been any one formed in Berlin?—I have never seen any. In the

Mr. *John E. Gray.*

26 April 1836.

the little synopsis of the museum at Berlin, published in 1818, it was proposed to publish a catalogue of the collection, but it has not yet appeared.

2625. Has there been published in Europe any general systematic catalogue of birds?—None that I am aware of. The only synopsis which can be called a general catalogue of birds, is the work of Latham, which was published about the year 1790; he has since published a general history, but of this the synopsis is still in MS.

2626. Has there been any general systematic catalogue of reptiles?—The latest work of the kind that I am aware of, is a work of Merrem, published in 1820, but that is like Fischer's work, a mere compilation (and not so well done), and it is not in conformity with modern views of arrangement, it is arranged according to a system that has long been exploded.

2627. Has there been any general systematic catalogue of fish since the time of Bloch's *Systema*, published by Schneider in 1791?—None. Cuvier was writing in conjunction with M. Valenciennes, a history of fishes; and promised, when that work came to an end, to give a synopsis, but since his death little progress has been made even in the general work.

2628. Do you conceive that the absence throughout Europe of general systematic catalogues of the different departments of natural history, has arisen from a feeling that the state of science does not admit of any effort of the kind approaching to the abstract idea of perfection entertained by the men of science in charge of the respective collections?—It arises from the enormous amount of labour which would be required for such a work; nobody could undertake to make a general catalogue of the kind. All that any man could fairly attempt would be to make a catalogue of one class, and then he might perhaps go on to another; but it would be ridiculous for any individual now to attempt to make a general catalogue of the whole animal kingdom.

2629. If a catalogue were formed without being published, do you, or do you not, consider that it would be desirable to have it exposed to public view?—I do not know that it would be of any use, because the catalogue would teach nothing that the specimens themselves would not teach, if properly arranged and exhibited. I may observe, having omitted to notice it before when questioned on the subject of catalogues, that an officer may frequently note in his catalogue certain observations which are the result of his own researches. I do not mean to say that observations so entered are his own private property; but they are, in point of fact, his own work, which he may make use of for himself, or which he may give away.

2630. Mr. *Colborne.*] If you took the best catalogue you could find, and marked off what specimens you had at the British Museum, would not you get a tolerable list of the desiderata?—We do so. We make out, for instance, a catalogue of the mammalia in the Museum, and then in a copy of the work of Fischer, to which I have before referred, we mark in the margin the number of each species that is entered in our catalogue; and this work, so marked, answers as a scientific index to our catalogue, and at the same time as a list of our desiderata.

2631. *Chairman.*] You have stated that since the publication of this edition of Fischer, there have been about 100 species that are not included in this work; have those all been discoveries made since that time, or were any of them omissions by Dr. Fischer when he published that work?—A great majority are discoveries since made. You will find, at the end of the work, a large supplementary list of species, almost all of which were taken from English books, which were not in his possession when he composed the work: but when I speak of 100 additional species, I mean beyond what are in the supplement also.

2632. Those in the supplement were discovered before 1829, but omitted in the body of his work?—He published the supplement in 1830.

2633. Mr. *Hawes.*] You have got in your hand Dr. Leach's printed catalogue, of which you spoke?—Yes; Sir Henry Ellis, of whom I had some time ago made inquiries concerning the book, has just put a copy into my hands.

2634. Do you consider it an useless publication?—No; but I must say that very little use has been made of it. Here is also a similar catalogue of the British vertebrata, published by Mr. Jenyns, of which, I believe, very few have been sold; but I beg to say that I believe catalogues in general to be extremely useful.

2635. Sir *Robert Inglis.*] It has been stated that all kinds of specimens, from the class of mammalia to the corals, are placed in one and the same room in the British Museum; assuming that the collection in the Museum is in a transition state

state now, can you state to the Committee whether you have observed in other museums, foreign and British, any similar intermixture of objects of natural history?—Premising that, as far as the British Museum is concerned, there is no intermixture of subjects for which the reasons are not obvious, I may state that animals of various classes are to be found similarly mixed together (that is to say, placed in the same room) in every collection that I have seen.

2636. Is it so in Paris?—In Paris, the same gallery that contains the birds contains, in its middle table, cases occupied by the shells, corals, radiated animals, crustacea, and insects; they are all in one room.

2637. Is it the case in Leyden?—In Leyden, the continuation of the gallery of mammalia is a square room, the walls of which are covered with mammalia, while the centre is occupied with shells.

2638. Whatever may be the objection to such intermixture in point of science, you find that practically, for the sake of economy of space, every museum within your range of observation has adopted the same plan?—I never saw an exception to it.

2639. Mr. *Hawes.*] In fact, you see the same absence of plan in all museums?—No; it does not depend on absence of plan in our museum. It is that different classes, although placed in the same room, are arranged in different series. We arrange the objects which occupy the wall in as good a series as we can, and we also arrange those which fill the table-cases on as good a series as circumstances admit; but as mammalia and birds could not be exhibited in table-cases, or shells and radiated animals shown to advantage in upright cases occupying the walls, we should lose the centre of the room if we devoted it to one class, and the walls if we devoted it to another; we should consequently want more than double our space for an imaginary advantage.

2640. Sir *Robert Inglis.*] In the lower rooms of the Mnseum of the College of Edinburgh there are, miscellaneously placed together, several distinct classes of objects?—It is the most miscellaneous arrangement that I ever saw. There are stuffed mammalia, skeletons, fishes, reptiles, ancient armour, Egyptian antiquities, basaltic columns, and corals, all in one room, and almost without order; it is, in fact, a museum fitted up for show, more like Mr. Bullock's, or the Leverian, than any museum I have ever seen, except perhaps a room in the museum at Bonn.

2641. In the upper room of the Edinburgh Museum are they equally mixed?—On the walls round the room there are birds, and in the table-cases in the centre, minerals. The middle case is occupied by shells. In the gallery there are birds on each side, and mammalia at each end. The remainder of the shells and mammalia are placed in a separate room on the same floor.

2642. You attribute this principally to the want of adequate space?—Yes; and also to the professor being without assistance.

2643. But you find the same intermixture in every museum with which you are acquainted?—Hardly to such an extent as in that of Edinburgh, because they have there only two large rooms and a few small ones, and their collection is of a very miscellaneous character.

2644. In the case of the British Museum, do you attribute such intermixture, where it may exist, to economy of space, arising from the want of sufficient room, or to any want of science in the arrangement itself?—It is the usual plan, and I cannot myself see any real objection to it. If a person wishes to see the reptiles, it can make no difference to him whether he find them in the collection placed after the fishes or before them.

2645. Are the various classes in the British Museum always arranged in distinct cases?—Always.

2646. The insects, the crustacea, the radiated animals, the corals and the shells are all arranged in distinct table-cases?—They are arranged in distinct series, as they would follow in Cuvier's animal kingdom. You begin with the crustacea, then follow the insects, and the radiated animals and corals.

2647. The last questions have related to the dry objects; will you state what is the system adopted with respect to the objects in spirits?—They are arranged on the same plan. You must, however, in some degree, adapt your collections to the size of the rooms; that is to say, you must, if possible, take a room sufficiently capacious to accommodate an entire collection of a particular class; and the fishes, requiring the largest space, we place them in the largest room. This necessitates the displacement of the reptiles and amphibia, which commence the series in the following

Mr. *John E. Gray.*

26 April 1836.

following room; then follow the crustacea, the insects, the mollusca and the radiated animals, in a regular series.

2648. Then the Committee are to understand, that whatever intermixture of subjects there may be in one and the same room, that there is no intermixture of subjects in the separate cases contained in the same room?—I believe there is none.

2649. But that a student, desirous of consulting the radiata, for example, would know at once to what room and to what cases he would have to refer?—Undoubtedly.

2650. Mr. *Hawes.*] And no confusion is likely to arise, you think, in consulting collections so intermixed?—I do not think it possible; they are kept decidedly distinct.

2651. Sir *Robert Inglis.*] Are the British birds and shells kept separate, for the use of collectors of British birds and shells?—They are kept distinct for that purpose.

2652. It being considered that in the British Museum such separation is consonant to the general objects of the institution?—Yes; and this results the more strongly from the peculiar taste of this country. From our insular position, many of our countrymen have been induced to pay more attention to our own birds and natural productions than to those of any other country. There are many among us who confine their study of natural history to English productions; and for their express use these collections have been kept separate. As a proof that our local fauna has been very much studied, I may refer to the great number of books that have been published upon the subject, a number, I believe, quite unparalleled in any other country.

2653. Are there many collectors of birds and shells peculiarly British in England?—I believe that four-fifths of those who make collections make special collections of English productions.

2654. Does not Cuvier, in the Règne Animal, particularly direct the attention of French zoologists to the species found in France?—His Règne Animal carefully indicates and describes the vertebrated animals of France; and he always gives, where it is possible, as the types of his genera, the species found in France.

2655. Are the Museum collections of British birds and British shells considered as of authority among all the collectors in England; and if so, upon what ground are they considered as of such authority?—They are so considered. We have constantly people coming from the country, who beg to be allowed to take out a bird to compare it with one that they have obtained, in order to make sure that it is the bird described by Montagu. Even Manchester weavers come to consult the collection in this way. Mr. Jenyns, to whose book on the British Vertebrata frequent reference has been made, while preparing that work for the press, described many of our birds, these birds being the type specimens. Indeed, almost every one who writes upon any particular branch of the British fauna consults our collection, as having been that described by Colonel Montagu, whose books still continue of high authority amongst British ornithologists and conchologists.

2656. It has been stated, in answer 1,511, by Dr. Grant, that Mr. Samouelle had arranged the collections of entomology, and that spaces are left for the insertion of specimens, which are desiderata at present in the Museum; but which may hereafter be found. Will you state to the Committee what would be the result, if the plan pursued with respect to insects, all which are contained in the cases in one room, were extended to the objects of natural history in the other divisions?—We should want, at least, three or four times the space we at present possess. And practically speaking, having formerly pursued that plan in some of my own private collections, I may state that I frequently found many more objects that I had not left spaces for, (that is to say new species) than I acquired of those that I had left spaces for. I found many new species long before I found the species for which spaces had been left; part of my cabinets thus became crowded, while other parts remained unoccupied, or occupied only with labels. If you put the names of all the known species in your cabinet, your collection will frequently look like a series of blank tickets. I am not aware of this plan having been adopted in a general way, in any collection of Europe, or in any one department of any collection. Indeed, to do it with certainty, it would require that the officer should have all the knowledge necessary for the formation of a perfect synopsis of the class; otherwise he would constantly be placing names as blanks, which are really only synonyms of species already in the collection.

2657. With respect to the best plan of arranging the collection, will you state whether,

whether, in your judgment, such arrangement should be according to the system of any foreign authority, or according to any system which might be arranged in the Museum itself?—In the present state of science in this country, it is well to arrange many parts of the collection according to a foreign authority; but I think that with a view to the progress of science, the officers of the Museum should not be bound so to do. It would tend to prevent any progress being made, if they were to be bound down by any one particular author or set of authors. We should, of course, be very much shackled if were obliged to follow a French arrangement, or a German arrangement, when the naturalists of those countries are left free to adopt such arrangements as may seem most desirable, and have gained their place in science by that very freedom.

2658. Would you allow the officers of the Museum to have full liberty to choose whatever system they might desire to follow?—Undoubtedly, supposing them to be competent persons. If a man is competent to the charge of the collection, he is competent to determine the mode of arrangement.

2659. And you would not consider that he was bound to follow any one particular system?—No.

2660. Would you consider it essential to the most advantageous use of the collections, that, whether correct or not, the nomenclature previously received and accredited should be adopted?—Not adopted if incorrect; but it should always be put upon the ticket: and it was upon this ground that Dr. Leach's tickets were removed, because they did not contain any reference to the works of other naturalists, and consequently were only useful to those who were acquainted with his own unpublished works.

2661. Has that practically been the principle; and is it the rule in respect to the specimens in the British Museum?—It has been the rule ever since I have been there.

2662. And where the nomenclature is changed, is there any indication of the fact of such change?—The fact is indicated by the object being placed in a different genus.

2663. The old name being retained?—Always.

2664. With respect to the nomenclature at the Jardin des Plantes in Paris, compared with the nomenclature of the British Museum, do you consider that it is more or less perfect?—We use the same system in our mode of naming; and I believe that our collection is as fully named as that of Paris. Indeed I think I can show that our collection is as fully named.

2665. Have you in this room any materials upon which you could give to the Committee any more detailed information upon this subject?—I have a letter from a friend relative to the shells in the collection of the Jardin des Plantes. This gentleman, who is a very good zoologist, writing from Paris under date of the 15th of February of the present year, says, "You ask me for an account of the species named, but as there are in almost every genus several species without tickets, an imperfect idea would be formed by neglecting these: on the other hand there are many instances where it is difficult to distinguish between varieties and species, which causes some uncertainty as to the actual number of the latter." Again, he observes, "considerable confusion is found in the names, as old ones are often allowed to remain with the new ones added in pencil."

2666. How are specimens of natural history ordinarily offered for sale at the British Museum?—They are usually brought to the officers of the department, except in the case of large collections, which may be offered through the secretary, and the officer lays them before the Trustees, stating whether he thinks them desirable. It is upon this recommendation, I believe, that they are purchased.

2667. Can you state to the Committee the number of species of birds known?—I think there are about 4,200 species described. Deleuze, in his history of the Paris Museum, states that they had in 1823, 2,300 species: in the British Museum we have about the same number. In the Paris Museum they have now a larger number; but no great addition has been recently made to this class.

2668. It has been stated by Dr. Grant, in answer 1472, that the numbers marked on some of the cases had very recently been altered. This evidence was given upon the 24th of March 1836: "The officers have inserted the names of animals in the course of this month, since some of my calculations were made out." Will you state to the Committee whether this alteration and this insertion be attributable to the evidence given by Dr. Grant, or whether it be in the ordinary course and progress of the arrangements by the officers of the Museum?—It was not at all

Mr. *John E. Gray.*

26 April 1836.

influenced by what Dr. Grant had said; the only alteration in the numbers of cases containing quadrupeds, that I am aware of, was that made on the cases containing the bats. I had been paying a good deal of attention to the bats, and during the last summer I inserted a considerable number of specimens which I had recently collected together. I had made out my catalogue and a synopsis of the species, and in order to exhibit the increased number of specimens, it was found necessary to insert additional cases; new numbers were of course required upon these cases in the common progress of the business of the Museum. As regards the insertion of the names, it arose from the circumstance that my brother, (who had been some time absent from illness, and who was occupied in naming the mammalia at the time when he was taken ill) returned to his duty about that time, and continued his suspended occupation of naming the mammalia. He went on inserting the names in the same manner as before his illness.

2669. It is stated in the same answer, that "in cases 28, 29 and 30, there are 46 specimens of bats, of which only three are named;" and "in case 25, containing 31 specimens of bats, two specimens only are named;" will you explain this to the Committee?—That is to say, Dr. Grant meant to say. Instead of named, it would be more proper to say labelled; every bat has got a number attached to it which refers to the catalogue; that catalogue is put into the hands of the person who writes the tickets, and he is writing them out as fast as he can; but as there are many thousands of tickets to write, and as they take on an average 20 minutes each, they cannot all be completed at once.

2670. The distinction which you wish the Committee to draw, is between naming and labelling?—Yes.

2671. But you mean the Committee to understand that every specimen bears a number?—Yes.

2672. And can be identified by the officers of the Museum, and can be identified by the visitor on reference to the catalogue in the possession of the officers?—Yes; these very bats, for instance, have been so identified by Mr. Bell. I left his artist this day drawing some which had been identified by those very numbers. The Committee, I believe, have it in evidence that they had been also so identified by Mr. Bennett. I may add, that most of the specimens have the name and the locality also written on them, or on the stand on which they are fixed.

2673. Mr. *Hawes.*] What means do you take to inform a visitor that there is such a catalogue?—I do not know what means we could take, except to give him the information if asked for. It would be a considerable waste of my time to write detailed labels for the specimens; whereas if I write a common label, or affix a number and reference, the purpose is sufficiently answered until the more formal label can be written and placed on the specimen.

2674. There is but one catalogue in manuscript, is there?—Only one, which is in my room.

2675. Which may by chance be wanted by more than one person at a time?—It is not probable that it would be wanted by more than one person at a time. There would not probably be more than one person, for instance, desirous of consulting that part of it which relates to the bats. The bats are in one volume; the monkeys in another, and so on; and if several persons were consulting the catalogue at the same time, they would probably require different volumes.

2676. Sir *Robert Inglis.*] Have you ever seen any synopsis of any foreign collection?—The only synopsis I have seen of any foreign collection, is that of the museum at Berlin, it is a zoological synopsis, and is stated in the title-page to be by Professor Lichtenstein, the director of the museum.

2677. Comparing it with the Synopsis of the British Museum, do you consider it to be more or less efficient for the objects either of the man of science or of the casual visitor?—It is very little more than a mere catalogue of a part of the species contained in the collection; I believe it has a very small sale, although it is sold at a very low price (eight groschen). This which I have was published in 1818, and I believe there has been none published since. There is a synopsis of the museum of the College of Surgeons "for the use of visitors," published in the same year, which is smaller still; it gives merely the heads of the collection, indicative of its general arrangement, and referring to the numbers marked on the specimens.

2678. That is dated in 1818; has there been any since?—Not to my knowledge; it was given to me at the college only a short time ago. I believe it is not

sold,

sold, but copies are placed on the table of the ante-room, so that each visitor may furnish himself with a copy when he enters the gallery.

2679. It consists of 24 pages?—Yes; it is valuable, as showing the arrangement made by John Hunter himself in the year 1786, which arrangement is nearly the same as that employed by Cuvier in the Cabinet of Comparative Anatomy at Paris.

2680. Is there any synopsis for the aid of the visitors in the Jardin des Plantes at Paris?—None that I am aware of. There was such a book published in the year 1800, entitled "Notice des Principaux Objects d'Histoire Naturelle, &c.," a copy of which is in the British Museum library. It does not at all agree with the present state of the museum.

2681. What is the character and value of the work of Deleuze?—It is in two volumes, octavo, with many plates. One volume is devoted to the history of the museum, and an account of the gardens; and the second is a kind of synoptical view of its contents; but I never saw it used in the manner of a synopsis in the collection. It was translated into English; but the sale has been very small, both of the original and of the translation. The translation was published at a guinea, and I believe it is now to be bought in London for 3*s.* 6*d.* It nearly agrees with the present state of the collection; but great alterations are about to take place in that collection, as new galleries are being built for the library, minerals and dried plants.

2682. Do you recollect what was the date of the publication of the work of Deleuze?—I think about the year 1823; that at least was the date of the translation, which was made immediately after the appearance of the original.

2683. It has been stated to-day in evidence, that the director of the museum at Leyden is in the habit of visiting the different museums on the Continent for the purpose of exchanging the duplicates of his own collection with the directors of other museums; can you state anything with respect to that subject?—I believe that he is in the habit of so doing. He has been to London twice or three times, chiefly, I think, with the view of purchasing. He came, for instance, to the sale of Bullock's museum; and he would probably come to any extensive sale. I understand that he keeps a running account with some collectors in this country, with whom he exchanges specimens.

2684. What is the proportion which the duplicates in the Museum bear to the originals?—We have very few duplicates of zoological specimens; indeed, we have scarcely any that are of any market value.

2685. In respect to those duplicates which you do possess:—are they gifts or purchases?—The greater part of them are gifts.

2686. If gifts, have you received them from their donors upon any and what condition as to their preservation?—We scarcely ever receive duplicates from donors. There are so many institutions possessing museums in this country, such as the United Service Museum and that of the Zoological Society, that when a person brings over a collection, he very commonly says, "Take what you want, and no more, as I have plenty of claims on me for the remainder." In those cases in which we have received presents of duplicates, I have always explained to the donor that their chief value consisted in the power of exchanging them for other specimens; and the general answer which I receive on such occasions is, "My object is to increase the collection of the Museum, and you must do with them what you think is best for the use of the institution."

2687. You see no objection to the disposal of duplicates supposing you possess such, but practically you do not possess them?—I see no objection to their being disposed of; but it is very difficult to determine the best mode of disposing of them to the most advantage. Thus, for instance, although M. Temminck makes such extensive exchanges, I have more than once heard him complain of the extreme difficulty he was under about the matter.

2688. Have they a money value attached to the specimens in the collection at Leyden?—When I was at the Leyden Museum, I purchased for myself, at a money value, certain specimens which I wished very particularly to have. I was told that the price of the specimens was 2*l.* 10*s.*, and that I was to give them anything they wanted of the same class, that I thought was of equal money value. I am told that that is the manner in which they conduct the business of exchanging; what you give is worth so much in money, and what they give in return is worth so much, so that it is an exchange of value for value.

2689. Without mentioning names, have you reason to think, from what you know of the system adopted in the Continental museums, that the exchange of

Mr. *John E. Gray.*

26 April 1836.

specimen for specimen has or has not been satisfactory to the parties concerned?—It is a matter of the utmost difficulty. It is a continual source of complaint among collectors that "Mr. So-and-so did not use me well in the exchanges which he made with me." I not only hear this in conversations, but often have my Continental friends making the same complaints. I believe that these exchanges are a continual source of heart-burning between naturalists, who would otherwise be good friends.

2690. Does the director of the Berlin Museum publish a list of duplicates?—There is a catalogue of the duplicates of that museum which are for sale.

2691. Is it published annually?—No; it was published in 1823. It is very useful, as it contains characters of many new species; and here is a supplement to it, which was published in 1830. That I believe to be one of the best ways of disposing of duplicates; but it requires a particular establishment for the purpose.

2692. Do any of the professors and curators of foreign museums who come to England sell specimens?—They continually come to purchase, and many of them bring specimens to sell. Indeed, I was told by one of the officers of the French Museum, that the salaries of the assistants of the museum were so low, that many of them were obliged to sell objects of natural history to make a living.

2693. What is the system which you would recommend to be adopted in reference to duplicates?—I think the better way would be to sell them by auction or by a priced catalogue. As to making exchanges, it is a thing which no officer would like to undertake. In my own case, I am ready to give and receive, but not to exchange; and I believe the same principle is acted on by the Zoological Society. In my private capacity, I never succeeded in making exchanges to my own satisfaction.

2694. From your experience as a man of science, of the habits of other men of science in respect to the British Museum, can you state whether the collections in the Museum are of use to such men of science:—are they in the habit of coming to consult them for scientific purposes?—I should say there is hardly a practical zoologist in London, who is not in the habit of coming continually to make use of the collections; and that is one of the most important uses of the Museum. The Committee have had before them many of these gentlemen, who have personally expressed their opinion upon the subject.

2695. Does your answer refer to the English scientific zoologists in all departments?—Yes; and not only to those resident in London, but naturalists often come from the country for the purpose of consulting our collections. Dr. Johnston of Berwick, Mr. Thompson of Belfast, zoologists from Edinburgh, Glasgow, and many other places, make frequent use of the collection; these zoologists hardly ever think it requisite to bring a letter of introduction; they come and state their wish to see any particular object, and it is shown to them.

2696. Can you specify the names of any scientific men, who have been in the habit of coming to the British Museum?—Dr. Horsfield, Mr. Bennett, Mr. Bell, Mr. Swainson, Dr. Richardson, Mr. Yarrell, Mr. Broderip, Mr. Ogilby, Mr. Owen, Mr. Jenyns, Professor Henslow, Mr. Stephens, Mr. Hope, Mr. Westwood, Mr. Walker, Mr. Shuckard, Mr. Curtis, Mr. Lear, Mr. Griffith, Mr. South, and very many others whose names do not occur to me at this moment; a complete list would include the name of every scientific zoologist who has visited London for the purpose of study.

2697. Have those gentlemen, within your own personal knowledge, acknowledged the use which they have made of the collections in the British Museum?—Many of them have referred to it in their works. I beg to read an extract from Mr. Swainson's Preface to his Work on the Birds of North America, published in conjunction with Dr. Richardson. He begins: "Nor has our own National Museum proved an unproductive field for research. Rich in the ornithology of the northern regions, it has furnished much valuable information, and the means of determining several new species; whatever reasons there might have been for censuring the general management of this institution, they have, we believe, long ceased to exist. The magnificence of the new rooms devoted to zoology, the sedulous care bestowed upon every donation, its immediate accessibility, but above all the free and courteous manner in which its treasures are gratuitously opened to the public, and to the man of science, demands the highest praise. Let but the Government second the zeal of its officers, and the public lend their aid by the contribution of specimens, and in a few years the British Museum will reflect

Mr. *John E. Gray.*

26 April 1836.

honour upon a powerful and wealthy nation. To J. G. Children, esq., as the officer more particularly in charge of the zoological subjects, my thanks are especially due, not merely for the courteous discharge of his official duty, but for all those prompt and nameless facilities which a scientific student stands so much in need of."—Mr. Swainson's Preface to the Fauna Boreali Americana, part 2, Birds, page 41, 183. Dr. Richardson, in the same work observes, "Having had access to many of the specimens procured in these voyages, and preserved in the British Museum, I have described them in the present work." In another place he says, "I embrace the opportunity here afforded of again returning my sincere thanks to Charles König, John George Children and John Gray, esquires, of the British Museum, for the great facilities they have invariably afforded me of consulting the Museum under their charge, and the desire they have constantly manifested of furthering my researches, by every means in their power." In his preface to the volume of that work, recently published, on Fish, Dr. Richardson says, "Lastly, I have again to acknowledge the attention of the officers of the British Museum, whenever I have had occasion to consult its library or natural collection, and particularly that of my friend J. E. Gray, esq., upon whose valuable time I have had occasion frequently to draw very largely." Richardson's Fauna Boreali Americana, part 3, introduction, page 14, 1836. Mr. Jenyns, in his work already referred to, says, "To Mr. Gray he desires to make an acknowledgment of the readiness with which he has at all times allowed him to consult the specimens in the British Museum." Jenyns' British Vertebrated Animals, preface 21, 1835. It is needless to multiply instances; but scarcely a volume of zoology issues from the press without similar acknowledgments.

2698. Can you furnish to the Committee any testimonies of a similar character from any foreign zoologists, who have visited the collections in the British Museum for the same general purposes of science?—As a proof of the advantages which they have derived from the British Museum, I beg leave to read one or two quotations of foreign zoologists, who have visited the British Museum within the last few years, for the purpose of describing zoological specimens. I may name at the moment among many others, MM. Cuvier, Valencienne, De Blainville, and Bibron, officers of the Paris Museum; M. Jourdan, professor of natural history, of Lyons; M. Lichtenstein, director of the museum at Berlin; M. Temminck, of that of Leyden; M. Wagler, professor of zoology at Munich, and M. Agassiz, professor at Neufchatel. All of these naturalists, except one, have been here twice, or oftener, for the express purpose of consulting the English collections. M. Agassiz, in his report on the fossil fish found in England says, "A Londres, le Musée Britannique m'a offert plusieurs espèces de poissons fossiles très interessantes provenant pour la plupart d'Œningen, de Glaris, de Lyme Regis, et de Sheppy. Les premières faisaient partie de la collection de feu le Docteur Ammann de Schaffhause; j'y ai retrouvé les originaux des figures que m'avait communiquées Cuvier. M. König m'en ayant facilité l'examen avec la plus grande obligeance, j'ai pu reconnaître que le grand poisson désigné à la page 22 du vol. 1, est un grand exemplaire de mon *Tinca furcata*, et non point le *Leuciscus Œningensis*. Parmi les poissons de Glaris, il y a une magnifique espèce nouvelle du genre *Fistularia*. M. Gray m'a aidé à comparer les espèces des Indes les plus remarquables que possède le Musée et en particulier les dessins de Hamilton Buchanan et du Général Hardwicke, auquel je dois aussi une superbe mâchoire du Rhina Ancylodon figurée dans la Zoologie des Indes. C'est surtout à la complaisance de M. Gray que je dois encore d'avoir pu dissequer un tres beau Lepidoste du Musée Britannique conservé dans l'esprit de vin." Agassiz, Recherches sur les Poissons Fossiles, Liv. 4, Rapport, &c. 8vo. p. 7, 1836. M. Cuvier says "Mon dernier voyage à Londres, m'a donné encore de nouvelles preuves de la genérosité des naturalistes Anglais, non moins que de l'ardeur eclairée avec laquelle ils s'occupent des progrès de leur science. M. Gray m'a fait connaitre sans réserve les nouvelles acquisitions du Museum Britannique. Cuvier Hist. Pois. vol. 7. "MM. les conservateurs du Museum Britannique lui ont communiqué les poissons rapportés du nord de l'ocean Pacifique par M. Collie, chirurgien de l'expedition du Capt. Beechey. M. Gray lui a fait connaître de nombreux dessins appartenans au General Hardwicke, et dont plusieurs de la main de feu Hamilton Buchanan representent les espèces décrites dans son ouvrage, mais dont il n'a pas donné de figures." Cuvier Hist. Poissons, vol. 4. General Hardwicke's drawings referred to in these two quotations, are now the property of the Museum. The same remark as to the facility of multiplying quotations, applies equally to foreign authors as to the British.

Mr. *John E. Gray.*

26 April 1836.

2699. The general result of those testimonies to which you have referred would lead you to the conclusion that a witness, who stated that the zoological collections of the British Museum had long been deprived of all practical utility, was not borne out by the facts?—I might refer you to many English books, which have been published of late years; as for example, Wood's Supplement to his Conchology, Griffith's Animal Kingdom, and the works of Sir William Jardine; for all which drawings have been continually taken from our collection. Mr. Jenyns, in his late work on the British Vertebrata, has described many specimens from it. Mr. Yarrell has done the same thing in his British Fishes; and there is scarcely a zoological work of any extent published in England, which is not more or less indebted to the British Museum.

2700. Have you ever been directed by the Trustees to attend parties of strangers visiting the Museum?—Never by the Trustees as a body; an individual Trustee may occasionally have come with a party, and may have said, "Will you accompany my friends over the collection;" but it is by no means customary.

2701. As a personal favour to an individual Trustee?—Yes.

2702. And you consider it quite a private affair among the officers when it is done?—Quite so.

2703. Does one officer occasionally do it for another?—Undoubtedly; if one is engaged, he asks another.

2704. Formerly the collection was shown to parties in succession, and each party was obliged to move at one and the same time from one room to another?—I believe it was the old law that 15 persons only were admitted at one time, and they were compelled to go all together from one room to another, the time of inspection of the whole collection being limited to two hours.

2705. But at present any party or any individual may remain as long as they please in any one room in the Museum?—Yes.

2706. What facilities has he, when in that room, of noticing or getting information about any particular subject?—He may remain there as long as he pleases, and the attendant can generally give such information as he may require; if the attendant is at a loss, he can come and ask an officer. I have been frequently asked by the attendants to explain questions that had been asked of them.

2707. You consider it your duty to give such information?—Yes; unless indeed I were to find a man coming day after day to obtain the most common information, so that it would be a mere waste of time to answer him.

2708. A passage was read to a witness, in question 313, in which passage the following words occur: "But if the salaries of the officers had been made respectable, and their rank a gratifying or enviable one, there would have been always a sufficient number of aspirants after such situations, and we should not have required the assistance of foreigners in that establishment, which ought to be the natural school of our academies in science and art." Will you state to the Committee what foreigners have been employed in the Museum?—In looking over the list, I find only two in the Natural History department, Dr. Solander and Mr. König. Both of these had been librarians to Sir Joseph Banks; both of them were well acquainted with the English language before they were appointed. Dr. Solander was one of the most scientific men, and unquestionably the best naturalist that England possessed in his day; of Mr. König's acquirements it would not be proper in me to speak.

2709. They both were intimately acquainted with the English language?—Intimately; and had been long resident in England before they were appointed.

2710. Can you state to the Committee, from your own knowledge and observation, what the professors in the Jardin des Plantes do with respect to the arrangements generally?—From what I have seen doing there, I believe they generally do little more than superintend it; they do very little in it themselves; it is done by their assistants, and I think I can show that such is the fact. In Mr. Deleuze's work, he observes, (vol. i. p. 71) four places of assistant naturalist were created, for the arrangement and preparation of the objects, under the direction of the professor; and in speaking of M. Valenciennes (vol. ii. p. 590), he says, "Under the direction of the professor of zoology and comparative anatomy, he has been charged, since the enlargement of the cabinet, (which took place in 1815,) with arranging and naming the collection of vertebrated animals." M. Valenciennes was then a very young man, not more than 21. "He was nominated to succeed his father in the museum in 1812," at the age of 18.

2711. Will you state what facilities exist with reference to the collections of the

Mr. *John E. Gray.*

26 April 1836.

Jardin des Plantes, as compared with the facilities to be found in the British Museum?—I should say that the facilities in the British Museum are very far greater. I experienced difficulties in consulting the Museum at Paris, and other of my friends have done the same, which I think no scientific man would find in England. Even Mr. Geoffroy himself, although a professor in the Jardin des Plantes, complains of not having access to certain specimens; one of the present professors, before his appointment, informed me that one of his objects in coming to England was to consult, in the British Museum, specimens which he had been refused permission to consult in the museum at Paris. I was myself at first refused permission to examine the reptiles and molluscous animals of that collection; but I did, after some difficulty, eventually see the reptiles, and at a subsequent visit to Paris, was allowed to examine the mollusca.

2712. Did you ever know a similar difficulty interposed in the British Museum to the examination of any part of its collections, either by natives or by foreigners?—Never in any way. I beg to say with respect to the Jardin des Plantes, that I am not speaking of the officers of that institution individually, with whom I am upon very good and friendly terms; but I am speaking of the results of the mode of government adopted there, that government having been referred to as a model. I have, therefore, thought it well to state some facts, which show that it is not so perfect in its results as it might be inferred from some of the statements that have been made.

2713. How has the management of the institution of the Jardin des Plantes worked for the increase of the collection?—I do not think it has worked so well as it ought to have worked, considering the enormous facilities which they have had for the purpose. They have had the pickings of all the local collections in the provincial towns of France; they had every facility that it was possible for the government to give them; and when Napoleon's conquests gave him possession of the museums of several foreign countries, those museums, or rather the specimens taken from them, were transferred to the collection of the Jardin des Plantes, and only the duplicates of the Paris collection returned when they were reclaimed at the peace; such, at least, was the case in Holland. The French armies have always been accompanied by scientific men, who made collections for the museum. They have also a number of collectors in their service called travelling naturalists, of whom there are no less than eight constantly employed in different parts of the world, for the express purpose of making collections. Indeed there is no facility that the government can give them which is not given.

2714. What facilities has the menagerie for the purchase of the living animals which may be brought to France?—The directors of the menagerie have the power of purchasing at their own price all the animals that may be brought for exhibition to Paris.

2715. Can you produce the authority for that statement?—It is so stated in M. Deleuze's book. M. Deleuze, it should be observed, was an officer of the museum. "At the same time, by a decree of the corporation of Paris, all itinerant menageries were forbidden, and those who gained their livelihood by exhibiting animals, were obliged to send them to the museum."—Deleuze, vol. 2, 557.

2716. When was the Jardin des Plantes established?—I think it was in 1635. It was reorganised into its present plan in 1793, when its government was completely altered.

2717. Considering, therefore, that it has existed two centuries, and considering, also, the favour which it has received from the French government, is it in that condition in which you would have reason to suppose that it should be?—I do not think it is in so good a condition as it would have been if there had been a governing body, who would have supervised the affairs of the institution, and paid greater attention to the preservation and the general wants of the collection.

2718. Are you able, from your own knowledge, to state to the Committee any facts relating to the mode in which new specimens are placed in the collections in France?—When I visited Paris to study the reptiles of the museum, they remained nearly in the same condition in which they had been for many years; and on my inquiring why the new accessions had not been placed with the others, I was told that it was the custom whenever they rearranged the collection, but not till then, to place all the accumulations acquired subsequent to the previous arrangement. It was the same with regard to the fishes, the mass of the collection of fishes was in M. Cuvier's apartments, and he was engaged in describing them, and as they were described, they were brought forward in the collection; the number exhibited

Mr. *John E. Gray.*

26 April 1836.

in the undescribed portion of the class being very small, and consisting only of those which had been arranged some years before.

2719. With what object did Cuvier form his collection of comparative anatomy?—He gives the reason for it in the preface to his Animal Kingdom, as follows: "M'etant voué par le goût dès ma premiere jeunesse à l'étude de l'anatomie comparée, et ayant depuis près de trente ans consacré à cette science tous les momens dont mes devoirs m'ont permis de disposer; j'ai eu pour but constant de mes travaux de la ramener à des règles generales et à des propositions qui en continssent l'expression la plus simple." It was consequently his natural taste for the subject that inclined him to follow it out in its details, and not the mere wish to form a collection for the purpose of illustrating his lectures, which are not alluded to.

Lord Viscount *Cole*, a Member of the House; Examined.

Lord Viscount *Cole*, M.P.

2720. Sir *Philip Egerton.*] YOU are a Member of the Royal Society and of the Zoological Society?—I am.

2721. You have given some attention to the study of geology?—To fossil osteology.

2722. And you have been a collector for some years?—I have.

2723. Are you acquainted with the collection of fossils in the British Museum?—I am.

2724. Will you inform the Committee what is your opinion of the collection?—The Saurian bones I think unique, of the British lias particularly; they have several unique specimens from the London clay, and from Maëstricht and from Monheim.

2725. What are those specimens?—The geosaurus, which I believe is unique; also the crocodilus priscus of Sömmering.

2726. Are you aware whether that is the specimen which has been figured in various works of geology, and which is the original specimen described by Sömmering?—I believe it is the one from which Cuvier made his drawings.

2727. And consequently, in addition to the intrinsic value of the specimen, it has an adventitious value, as having been the specimen described by Sömmering himself?—Certainly.

2728. Have you visited any collections on the Continent?—A good number.

2729. Will you mention them?—Paris, Leyden, Bonn, Darmstadt, Frankfort, Dresden, Munich, Stutgard, Berne, Zurich and others.

2730. Confining your observations to fossil saurians, is it your opinion that any of those foreign museums possess a collection at all to be compared with the collection in the British Museum?—I have not seen in any foreign museum anything that comes near it, so far as I can recollect.

2731. Are you acquainted with the collection of fossil mammalia in the British Museum?—Yes.

2732. What is your opinion of that collection;—I think it is a very good collection; the fossil elephant and mastodon bones especially there are also very beautiful casts.

2733. What are the casts of?—Casts of the megatherium, casts of the dinotherium, and other pachydermata from Eppelsheim; and casts of pachydermata from the gypsum quarries at Paris, together with several bones from the same locality.

2734. Do you agree with Dr. Grant, who stated that "not a real fragment is seen of any one of those quadrupeds?"—Certainly not.

2735. With regard to the casts of megatherium, are you aware where the originals are?—Yes; they are in the College of Surgeons. The casts are executed by Chantry, and I think they are unequalled for beauty.

2736. Mr. *Hawes.*] Will your lordship have the goodness to look at the specimens named by Dr. Grant, in answer 1513, and state of what specimens there named there are any real remains?—Anoplotherium and palœotherium, I believe.

2737. Sir *Philip Egerton.*] Are you acquainted with any other museum which possesses any considerable quantity of bones of the megatherium?—There is a collection at Madrid, and some few at Cambridge.

2738. Are they specimens, the opportunities of acquiring which occur frequently?—Scarcely ever. In this case, Mr. Woodbine Parish brought them over.

2739. You have seen the originals of those casts?—I have.

2740. What is your opinion of the fidelity of the casts as compared with the originals?—I think they are the most beautiful casts that I ever saw. They are done by Chantry. The sharpness with which the grain of the bone and every feature is shown makes them very nearly equal in beauty to the originals.

2741. Then you would conceive that in a case where the original was not to be procured, the British Museum have shown a great desire to exhibit objects which, in a scientific point of view, must rank second to the originals, namely, faithful casts of those originals?—Certainly.

2742. The other casts you have stated to be specimens from Epplesheim, and you stated that you saw them at the museum of Darmstadt; are you aware of any other museum on the Continent which possesses specimens from that locality?—I never saw them, except at the museum at Darmstadt; they are only found in the great duchy of Hesse, and they all go to the museum at Darmstadt.

2743. Do not those remains combine some of the most extraordinary forms of extinct animals with which the geologist is acquainted?—They do.

2744. Are you aware whether those are models, or correct casts of the originals?—Correct casts of the originals.

2745. Then the observations which you have before made with regard to the megatherium, hold good with respect to the Darmstadt casts?—They do. Indeed with respect to Darmstadt I should say, that in many cases, although of course at present the originals must be the most valuable, yet in course of time I should say that the casts will be more so, for the specimens are in such a very rotten state that the casts will last much longer than the specimens themselves.

2746. Are you satisfied with the mode in which those casts are exhibited in the Museum?—I am; I do not think they can be better exhibited.

2746. In short, that they present an assemblage of interesting forms, arranged in a very striking part of the Museum, and likely to prove most interesting to the British public?—I should say so.

2748. The Committee have been informed by Dr. Grant, in answer 1514, that "there is not a single species or specimen of any extinct zoophyte yet exhibited;" are you aware whether any remains of the crinoidea are exhibited?—I think there is a case of crinoidal remains in the room.

2749. Mr. *Hawes.*] Has your Lordship examined all the specimens of saurian remains in the British Museum?—I think I have.

2750. Do you consider them all of equal value?—No.

2751. Will you state which you consider the most valuable, and which the least valuable?—I consider Hawkins's collection of saurians as being the largest and the most unique, and by far the most valuable.

2752. If the keeper of the Natural History department should have stated that "the two largest specimens, especially the principal ichthyosaurus, which, on account of its supposed perfection has been valued at 500 *l.* have turned out to be of much less value, on account of their being made up and all over restored with plaister of Paris, and altogether unfit to be exhibited to the public without derogation to the character of the British Museum," would your Lordship still be disposed to retain the same opinion?—I mean to say that the large specimen, to a certain degree, is made up; the part that is made up is not engraved in Hawkins's book, and I can also state that that specimen never was valued at 500 *l.*

2753. Will your Lordship undertake to state that there is no one specimen which is altogether fabricated?—I will.

2754. Is your Lordship able to state that from personal inspection?—From personal inspection.

2755. Will you be so good as to state whether you have examined the specimen which is now upon the floor of the long room?—I have.

2756. Then if the keeper of the Natural History department has stated that in his opinion it is altogether fabricated, your Lordship doubts that opinion?—I think he is mistaken, and has spoken rather hastily.

2757. Has your Lordship pursued the study as a science or as an amusement?—I have pursued it as a science and as an amusement both.

2758. Has your Lordship published any work?—No.

2759. Or written any paper in any learned society?—No, I have not.

2760. Are you aware of what Dr. Buckland has stated in a letter, addressed to the secretary, "that Mr. Hawkins would have done well had he indicated the amount of his restorations in his published plates"?—I am not aware that Mr. Hawkins has

Lord Viscount *Cole*, M.P.

26 April 1836.

has, in the degree which is stated, exaggerated any of the plates. The large specimen had the paddle, which is the great restoration, marked in outline.

2761. You are aware that Dr. Buckland stated, in a letter addressed to the Trustees of the Museum, dated Oxford, the 7th July 1834, that "the specimens offered for sale are all beautifully and most accurately engraved, in a folio volume, just published by Mr. Hawkins, ichthyosauri and plesiosauri, which may be considered as a catalogue of the collection"?—I have not seen the letter.

2762. The letter being shown to your Lordship, will you now state your opinion in reference to the collection itself?—I should say that Mr. Hawkins's book, as far as I have seen it, is correct, because, as I stated, the great restoration is in the large beast, and that I know is marked in it in outline; and the vertebræ of the tail I do not believe are put in at all.

2763. Then your Lordship is disposed to think that it was accurately engraved in the folio plate published by Mr. Hawkins?—As far as I have seen I think it is.

2764. What is your Lordship's opinion as to the practice of fabricating portions of an animal, with a view to make it complete?—I should say, that if we have authority for it in the specimens that have been found, it is no harm, to a small degree, to make the specimens up.

2765. The following is a passage from a letter from Dr. Buckland; he says, "Many of the specimens have, for three or four years past, been under my observation, and I have often remonstrated against a practice which I could not prevent." Do you still continue to think that that practice is not objectionable?—If the thing is not made up in too great a degree. I stated particularly that, if you have authority for so doing, you may, to a small degree, do it; but I do not say that I should do it to the extent that Mr. Hawkins did, by putting in an entire paddle, or by putting in a tail.

2766. If you did fabricate any portions, you would take care to mark out those portions that were artificial from those that were genuine?—I do not know that I should.

2767. You think there is no danger of any injurious deceptions by imitation of the real portions?—If you have full authority from specimens, and only make up in a small degree, I do not think there is much harm.

2768. Sir *Robert Inglis.*] Assuming always that you can find some existing specimen of the corresponding part which happens to be missing in your own collection?—Yes, if you have a specimen of the same kind which gives you full authority.

2769. Sir *Philip Egerton.*] For instance, if you have the two extremities of a bone, and there may be an inch wanting in the middle of the bone, you would have no objection to fill up that?—No; that is what I mean.

2770. Mr. *Hawes.*] Would you go to the extent of fabricating the whole tail of an animal and the vertebræ, to the extent that was done in number 168?—I have stated that I would not do it.

2771. Then you did not approve of it in this case to the extent to which it was carried?—No.

2772. The long specimen upon the floor, what value do you attach to that?—I cannot state what value; I know that it was not valued in the collection; I heard Dr. Buckland say so.

2773. Have you examined it minutely?—I have.

2774. To what extent do you think it is artificial?—I can state what is not artificial in it; there are the bodies of nearly 50 vertebræ that are natural; there are fragments of ribs, some of the pelvis and paddle-bones that are the real fossil.

2775. At the same time it has the appearance of being a perfect specimen?—No, anything but a perfect specimen; a very bad fragment.

2776. But does it not appear to be entirely genuine?—To a superficial observer going by; but, if you come to examine it, it is evidently not so.

2777. You think it might be exhibited without derogation from the character of the British Museum?—It was bought in a lot; you could not leave one specimen out. I know there was no value put upon it, and it was merely put in with the other things, as part of the collection; I have heard Mr. Mantell and Dr. Buckland, both distinctly state that there was no value put upon that.

2778. There have been very extensive discoveries of fossil remains generally in England of late years?—There have.

2779. Do you think the British Museum possesses a fair portion of those discoveries?—I do. Lord Viscount *Cole*, M.P.

2780. As compared with any private collection?—I do; the British Museum has, independent of Hawkins's fossils, several beautiful specimens of the British lias. 26 April 1836.

Jovis, 28° die Aprilis, 1836.

MEMBERS PRESENT.

Mr. T. G. B. Estcourt.	Mr. Thorneley.
Sir Robert Inglis.	Sir Philip Egerton.
Mr. Hawes.	Mr. B. Baring.
Mr. Compton.	

MR. T. G. B. ESTCOURT, IN THE CHAIR.

John George Children, Esq., called in; and Examined.

2781. Sir *Robert Inglis.*] IT has been stated by Dr. Grant, in answer 252, that many of the most interesting and rare specimens of the class mammalia are exposed to destruction from dust and insects, are completely excluded from all systematic arrangement, and, wanting their scientific names, are placed in the most confused manner about the lobbies, the staircase, the tops of cases, and in all parts of the house of the British Museum. Will you state to the Committee what explanation or answer you would make to such a description?—In the first place, with regard to many of the most interesting and rare specimens being exposed to destruction from dust and insects, I beg to state that the fact is, that the old giraffes, one of the hippopotami, and Mr. Patterson's giraffe, the Koudou antelope, and the Siberian elk (the three last were brought from the College of Surgeons) are placed uncovered on the staircase of the Museum, and in the saloon there is an American tapir, a great seal, an Ursine seal, and two specimens of the great Armadillo; besides those, I do not recollect any others that are exposed; and with respect to them, the old giraffes and Patterson's giraffe are beyond all possibility of further injury. The Koudou antelope and elk both came, as I have said before, from the College of Surgeons, and they have been exposed for years in the same way in the museum of the College, and are certainly not likely to be further injured in the slightest degree by their present exposure; they are exposed because there is no possibility of covering them. *John G. Children*, Esq. 28 April 1836.

2782. When you use the expression, "beyond all possibility of further injury," do you wish the Committee to understand, that whatever injury the specimens in question have sustained, has been sustained within or without the walls of the establishment in which they are now placed?—Without the walls of the Museum, in the museum of the College of Surgeons; with respect to the hippopotami and the armadillos, no exposure can hurt them; there is nothing about them that is liable to injury.

2783. It has been stated in the same answer by Dr. Grant, that the specimens in the quadruped room, even those contained in cases, are not placed in zoological order; will you explain to the Committee the state of the facts as you regard them?—With respect to their not being in strict zoological order, the answer to that is, that they are as much so as the cases will admit of. I have this day received from Mr. Gould a great many specimens, which he has lately had for stuffing, and I was quite at a loss when I saw them to conceive how they can be got into the cases at all. I left them endeavouring to get them in, and I hope they will succeed; but it is impossible, in the present defective state of those cases, from the want of accommodation, to get them into any regular systematic order.

2784. When you state the defective state of the cases in the saloon to which the answer has referred, do you wish the Committee to understand that such confinement and deficiency of space may be regarded as owing to the transition

John G. Children, Esq.

28 April 1836.

sition state of the Natural History department, or as involving any fundamental neglect of those objects on the part of the governing body of the Museum?—Certainly to the transition state. We have made the best of a bad matter; we have made the best of the space that we had; we have not sufficient space at present to put them in. It is expressly stated in the Synopsis, at page 22, that "the want of more space in the large cases has rendered it necessary to place the smaller species of mammalia for the present in the upright cases between the windows on the north side of the room," and consequently those mammalia are not in the regular series that they would be in were there sufficient space to arrange them.

2785. Are the Committee to understand that the cases were made at a time when the collection was very inferior in extent to the present collection?—The cases were made, as far as I recollect, for the places where they are; the room is not large enough to admit of more cases, and the cases are not large enough to admit of more specimens, or of that regularity of arrangement which more ample accommodation would allow.

2786. At the time when the cases were placed in the rooms in which they now stand, were they such as corresponded with the then existing collection?—More nearly than they do now, because there have been subsequently a great many species added.

2787. In Dr. Grant's answer, 258, he says, "There were found collected together in the same apartment, specimens of all kinds, from the highest to the lowest classes, and that this confusion is repeated throughout different departments." Does the answer which you have given to the preceding question apply equally to the observation made by Dr. Grant in the words now quoted?—Yes.

2788. The Committee are then, from your evidence, to understand that the want of accommodation, and the apparent confusion in particular apartments, may be attributed entirely to the want of adequate space, and that such want of adequate space is, probably, at no distant day to be removed by the transfer of the collections to the new buildings, and that at this moment they are in what may be called a transition state?—Certainly.

2789. With regard to the exhibition and exposure to the light of a certain portion of the collection, namely, the Entomological collection, will you state any observations which occur to you in reference to such subject, having in view the answer given by Dr. Grant, 285: "I am well aware that there is exhibited to the public at present of the whole class of insects, comprehending more than 100,000 species, only one glazed case, containing a few species selected at great distances from each other, throughout the orders and families of that class of animals;" what observation have you to make in reference to that?—I cannot say what number of species there are of insects, but I should think there can be nothing like 100,000 species in the Museum taking it altogether. Dr. Grant cannot mean to say there are only 100,000 species of insects known, when at the Berlin Museum alone, it is said that there are 40,000 species of coleoptera; and there can, I think, be no question that the aggregate of the species of the other orders must amount to a great deal more than 100,000.

2790. Whatever may be the number of species known to exist, the Museum at this moment exhibits only, according to Dr. Grant's answer, one glazed case; will you state the ground upon which this limit is placed?—Those were selected from such duplicates as could be afforded at the time, when it was desired that some insects might be exhibited; and it was almost, I think, a pity that any were ordered to be put out, as they necessarily will be deteriorated and even spoiled by exposure to light. There were not any more duplicates that could be afforded out of the Museum collections for that purpose. I remember Mr. Samoulle being desired to make that exhibition, and those now placed in the ninth room were what he selected, and I am not aware that there were any more that he could put in.

2791. Dr. Grant has stated, in answer 1089, that he considers the collection of mammalia in the Jardin des Plantes, as superior to that in the British Museum, in number, in arrangement, in condition, and in value; and being asked what he meant by the term "value," he replied, in the two next answers, that he referred to the scientific value, with reference to the scientific utility of the objects; will you state to the Committee what in your judgment is the comparison between the scientific utility of the collection in the Museum, and the scientific utility of the collection in the Jardin des Plantes?—I do not know much of the number or arrangement,

John G. Children, Esq.

28 April 1836.

arrangement, or of the condition of the mammalia in the Jardin des Plantes, as I only visited it once, and that several years ago, and then I was in very bad health; but with respect to scientific utility, if Dr. Grant meant to confine that term to the use which the specimens are of either to the proficient, or to the student naturalist, or to the artist, I must say that I think Dr. Grant is entirely mistaken, and that greater facilities are afforded to each of those respective classes of people for using the collections of the British Museum, than are afforded at Paris. I think that both with respect to time and opportunity, and facility of access, the argument is entirely against him. I do not know what recent arrangements may have been made, but I do know that the last time I was in Paris, the museum was only open for a very few hours in the day; and if it had not been for the late Baron Cuvier's personal kindness to me, I should not have seen a quarter of it.

2792. From your experience of the visits of men of science to the Museum, yourself a man of science, can you state to the Committee whether in your judgment you regard the collections in the British Museum as almost useless to the public, in the words of Dr. Grant, in his answer 1474?—I think that question has been already most decidedly answered, and Dr. Grant's assertion refuted by a great many most respectable witnesses who have gone before me; but speaking as a gentleman and a man of honour, I must say that that assertion is totally unfounded; that they are as useful as their present state and arrangement can possibly make them, and that, in point of facility of access, I believe that no person can honestly come forward and say that he ever was denied a single application; I have frequently ordered things to be taken out myself, and have frequently attended with my keys to open the cases to persons whom I never knew or saw before, and I would do it again to any one any day; I know that Mr. Gray has done the same continually.

2793. Dr. Grant has stated, in answer 1475, that the antiquated names of Linnæus are not suited to the present state of zoology; will you state your judgment as a man of science upon that subject?—I think the specific names of Linnæus ought never to be abandoned; for nine times in ten they are the original names, and therefore entitled to priority. I think even in genera his generic names should be taken, either as the denomination of the family or as that of the principal genus, when, as occurs in many cases, a Linnean genus has been subdivided; and I may add, with respect to such subdivisions, that it has always been my intention to have the names of the modern genera of mammalia placed, on separate stands, at the head of each genus respectively, after the manner of the Jardin des Plantes, and as has been done already in the general collection of birds; but there is great difficulty in doing that in the present state of the collection of mammalia; since, for the reasons I have already given, it is impossible, under existing circumstances, to adopt that distinct arrangement that would admit of the execution of that plan at this time. The generic name Pithecus, for instance, would seem, if so placed, in the present state of things, to apply to almost all the monkeys in the case.

2794. Dr. Grant has stated, in answer 1479, that not a single species of the general collection of birds is named by its scientific designation in the synopsis. Will you state what in your judgment is the state of the fact upon the point now at issue?—The Synopsis consists of 240 pages, and the account of the British birds alone occupies 16 of those pages, or one-fifteenth of the whole. Now in the British birds there are both the Latin and the English names; if the same thing had been carried out with respect to the general collection, the Synopsis would have swelled, in that part of it only, into a volume: it was therefore to save unnecessary repetition and expense that it was not thought necessary to add those names.

2795. Are they named on the specimens themselves?—Yes, in general.

2796. Mr. *Hawes.*] In all cases?—I should not say in all cases,

2797. What proportion do those named bear to those unnamed?—That is more than I am prepared to say; I cannot state, unless I were to go and count them, because the names are continually putting on; they are continually being written. It must be obvious to the Committee, that where there is so much different work to do, and where there is a liability to be continually called from one part to another, no one species of work can be completed, without a total neglect of all the rest, and therefore it is necessary to keep sometimes one part going on and sometimes another.

2798. Sir *Robert Inglis.*] Would you say that it was correct to assert, as in

John G. Children, Esq.

28 April 1836.

answer 1487, it is asserted, that the visitor looks in vain for the names, sometimes of 50 or 60 specimens together, which have not a single name attached to any one?—No, I certainly think that is not correct.

2799. Mr. *Hawes.*] Do you distinctly affirm that it is incorrect?—I cannot say that I have counted every part to see; there may be here and there a good many specimens together without name, but I think I might almost venture to say that it is not correct.

2800. Have you had your attention drawn to that answer of Dr. Grant before to-day?—Merely in reading it. I have read Dr. Grant's evidence.

2801. In consequence of reading that evidence, and more partiularly this answer, did you take any pains to ascertain whether the fact was so or not?—No, I did not.

2802. Sir *Robert Inglis.*] Has any large proportion of the names been removed for the purpose of being copied out afresh in more legible characters?—It has been complained that the mammalia are not at all named. With respect to that, I beg leave to state the fact, which was this: At the time when I stated (in my former evidence) that most of them were named, it was strictly the fact. Subsequently to that however, partly from the derangement of the labels by the attendants in cleaning the animals, and partly from the insertion of a great many new species, many of the old labels got out of their places, and Mr. George Gray took them out with the intention of re-writing them. I do not say that it would not have been better to have put the old labels in their places again, and then to have taken them out portion by portion. But, however, Mr. George Gray thought he could soon get the whole done, and so he took nearly the whole out. Before he had made much progress in the work, he was called off to some other business, and, before that was completed, he was taken seriously ill; that has been the reason why there is that apparent contradiction to my statement in my former evidence.

2803. Can you state whether there be a distinction to be made between the *name*, and the *label* containing such name, attachable to particular specimens:—In other words, are the specimens all named, though there be no label affixed to the object itself?—Yes, I believe in most cases the names are written at the bottom of the stands.

2804. Are the Committee to understand that there is a name or a number identifying the specimen, in those instances in which there may not be a label exhibiting that name to the spectator?—With the exception of those very recently put in; there have been some put in to-day.

2805. The principle of the department then is to attach a name or a number to each object, and to exhibit such name in the label so soon as time may permit?—Certainly; I believe Mr. Gray produced a catalogue the other day of a part of the mammalia; the corresponding number and name are entered in the catalogue, which is now in progress.

2806. Therefore the nomenclature is distinguished from the label so completed, though a label may not be attached to every specimen?—Yes.

2807. You would consider it desirable that a label should be attached as soon as possible?—Certainly.

2808. And progress is making in labelling the specimens?—It is; and most undoubtedly it is absolutely necessary that the labels should be attached as soon as they can, because the names which are upon the stands cannot be seen by the public, being at the bottom.

2809. Mr. *Hawes.*] Are the Committee to understand then that every specimen is actually named in the catalogue, though it may not be actually labelled in the collection?—I believe almost every specimen is, with the exception of some that have been recently put in.

2810. But with that exception, is there an accessible catalogue of the whole Zoological collection?—No, I do not say that of the Zoological collection in all its branches, but of the mammalia; I think the catalogue of the mammalia is complete, or nearly so.

2811. Can you say how many specimens there are of the class mammalia exhibited?—No; they have been very much increased within the last two months.

2812. But in your opinion there is an accurate catalogue of them?—I believe there is; Mr. Gray will probably be able to state whether it is so or not; but I believe that it is very nearly or quite complete.

2813. Sir

John G. Children Esq.

28 April 1836.

2813. Sir *Robert Inglis.*] Dr. Grant referred, in the answer to the question, No. 1,506, to a specimen of the vertebral column of a serpent, labelled thus: "Vertebra of an Indian Boa," and he stated that he conceives the question including those words was put "To record the fact that there is that neglect of the specimens in the British Museum, which should have left a label of that absurd character painted in large capitals." Will you explain to the Committee, what, in your judgment, is the right view of the fact quoted in that question?—With respect o the name standing "Vertebra," instead of "Vertebræ," the fact is admitted; but I think Dr. Grant's comment is rather a proof that it is more easy to see the mote in your neighbour's eye than the beam in your own; for in Dr. Grant's work, now in course of publication, his "Outlines of Comparative Anatomy," there is a mistake of just the same kind. For instance, at page 15, part 1, of that work, the following passage occurs: "There are firm superficial longitudinal bands, in most of the ciliograde acalepha," &c. Again, three lines lower "And from *their* swimming habits, it is obvious that the acalepha" &c. A third instance of the same mistake occurs at the fourth line from the bottom of the same page, where it is said, "The porpita, which is another of *these* floating acalepha," &c.

2814. Is the mistake in your judgment a clerical error, or the result of a want of knowledge on the part of those who have the charge of the collection?—It is an error of the painter who painted the label, and it seems that neither Mr. Gray's eyes nor mine, nor anybody's else belonging to the department, had detected this mighty blunder; there is half a letter left out.

2815. Has it been corrected since?—I have given no order for correcting it since, because it would look as if one corrected it to prevent its being noticed; but it will be corrected the first time the painter comes.

2816. Mr. *Hawes.*] How long has it been in that state?—I do not know; for I did not know that it was so; but the same sort of mistake occurs more than once in Dr. Grant's own work, as I have already pointed out. But I do not mean to say that that arises from Dr. Grant's ignorance, though he seems to attribute ignorance to us for having left out half a letter.

2817. You think that the cases are quite parallel?—I do not know anything about the parallelism of the cases; I will not undertake to say why Dr. Grant's book stands in that imperfect state; I only say that I do not accuse him of ignorance on account of that, nor even for the following passage which I find at the next page but one of the same work: "The lateral and dorsal parts of the segments often support fixed or moveable spines, which grow like the plates themselves, by the successive addition of calcareous layers from the thin fleshy secreting membrane which covers every part of the calcareous skeletons of echinoderma;" though most authors would have written echinoder*mata*.

2818. Sir *Robert Inglis.*] Dr. Grant has stated, in answer 1507, that "the difference of the classifications of the same animals in the two adjoining rooms, tends much to confuse the student who has studied the general collection." The answer has regard to a question relating to the two collections of birds, that of the British birds and the general collection?—I suppose that Dr. Grant meant with respect to the recent alteration that has been made in adopting Jenyns's classification of the British birds; it was my own doing; I desired it to be done, because I consider that the work of Mr. Jenyns, which relates solely to the British Fauna, will be a standard book, and by far the most useful work that has been hitherto published on the British vertebrata, and I therefore thought it would be much more convenient to the British naturalist to be referred to such a work as that, than to a work that is more general; and I consequently desired the collection to be named according to Mr. Jenyns's, and the specimens to be placed strictly in the same arrangement that he has adopted. With respect to any possibility of confusion arising from that, I cannot conceive how that could be, because Mr. Jenyns invariably quotes Temminck, and he also quotes Mr. Selby's "Illustrations of British Ornithology; and though the synonyms of Mr. Jenyns's work are not very ample, those of Mr. Selby's are extremely so, and Temminck's name is never omitted; I cannot conceive it is possible, therefore, that any confusion can arise to any one who sees the same bird in one collection under Jenyns's name, and in the other collection under Temminck's; because he would only have to refer to Jenyns's work, and the whole must immediately be clear.

2819. It is stated by Dr. Grant, in answer 1516, that "the species in the collection of British Birds have been identified and named by a boy who is employed in the British Museum in the capacity of a copier of labels; that boy has been able,

John G. Children, Esq.

28 April 1836.

able, I understand, to name and label every species of the British collection of birds in the Museum;" will you explain what is the state of the fact, in your judgment, involved in this answer?—The state of the fact with respect to that is simply this; when Mr. White, which is the "boy's" named, came to the British Museum, I found him very intelligent, and I desired him to do that which I have just stated, viz. to make the alterations alluded to, with respect to the British birds; I did not tell him to name a single species, nor was there any necessity that I should do so, for every species was named already; he had only to take the labels which he found upon them, and where they did not exactly correspond with Mr. Jenyns's nomenclature, then to alter the Temminck name which he found upon it, and adopt that of Mr. Jenyns; he had no direction whatever to name any species. He asked me if he should, in cases where he could make them out, put the usual mark, male or female, adult or young, and so forth; I told him, where he could be perfectly certain, it would be advantageous to do so, always with the intention that his work should be afterwards carefully examined to see that there were no mistakes. That is what he did, and whatever he did further was done without any orders at all from me, or, I believe, any one else.

2820. The individual described in the answer of Dr. Grant as a boy, and whom you have named as Mr. White, was lately introduced into the Museum; under what circumstances was he introduced?—Mr. Gray met with him in Edinburgh, and was extremely pleased with him; he found that the lad wished very much for an opportunity of consulting the collections in London, he was very ardent in his desire to improve himself in natural history, and he did not think that he had sufficient opportunities of doing so in Edinburgh, and Mr. Gray very kindly offered him a home in his own house for some months, to enable him to accomplish his object; we wanted an additional assistant, and, on Mr. Gray's suggestion, I saw this boy, and finding Mr. Gray's statement of him was perfectly correct, I recommended him to the Trustees of the Museum. He was very properly told that he must produce testimonials, and he wrote accordingly to the different masters whom he had been under at the College in Edinburgh and at the High School, and received a most admirable character from those persons, whose testimonials I forwarded to his Grace the Archbishop of Canterbury, who was thereupon pleased to give him the appointment.

2821. Mr. *Hawes.*] Did you consult the head of the department?—No, I did not; certainly it was strictly my duty to have done so, but I have already explained that the department is in that disjointed state, that is to say, Mr. König has so much given up to me the superintendence of the Zoological part, that I have not thought it necessary to recur to him continually; but most certainly strictly I ought to have done it.

2822. Sir *Robert Inglis.*] Practically speaking, the recommendation came from the individual who had the more immediate custody and management of the department into which the young man was to be introduced?—Certainly; from myself.

2823. Mr. *Hawes.*] Does not that fact furnish an additional reason for a better division of the departments?—I have stated already my views upon that subject, and if it had not been from feelings of delicacy, which led me to fear that I might be supposed to act from interested motives, I should long ago have urged it; but I beg that it may be understood that it is from no unkindly or disrespectful feelings for Mr. König, for whom I have the highest regard.

2824. Sir *Robert Inglis.*] In answer 1523, Dr. Grant has stated, "Our Lama's mouth is of painted plaster, which happily has withstood the ravages of the insects which have so often swarmed upon its hide; and the naked and decayed hide of our coudou antelope, placed in the staircase, gives early warning of the state of our collections within, where our best specimens are disposed along the tops of our cases, alike exposed to dust and insects as those without." In reference to the latter part of that answer you have already made some observations, but with respect to the former part of the quotation, namely, that relating to the lama and the coudou antelope, will you state what is the fact in your view of their condition, and the circumstances under which their condition is such as it is?—The lama is in just as good a state as when it came to us; it was in a very bad state when it came to us; there do appear to have been some insects upon its skin, but all dead, and apparently have long been so; it is, however, just as it came from the College of Surgeons, and it is now in a glass case.

2825. Are the Committee to understand, that, whether it be good or bad, the specimen

specimen in both instances is such as it came from the College of Surgeons to the British Museum?—Certainly.

2826. Mr. *Hawes.*] Is it retained because it is good or bad?—It was given; we have not thought it so bad as not to keep it; if it were a good specimen it would be a very valuable one. It was given us lately by the College of Surgeons.

2827. Sir *Robert Inglis.*] It was given to the Museum at the time when the College of Surgeons were making their new arrangements, and confining their collections chiefly to comparative anatomy and osteological collections?—It was when they began their new building.

2828. Mr. *Hawes.*] Is it the fact that the lama's mouth is of painted plaster?—I believe it is; it is just as they sent it; it is they that doctored it and not we; it is a very bad specimen.

2829. Then why is it exhibited?—It is better to exhibit a bad specimen than none at all; it can do no harm.

2830. Are there any specimens in store then of a superior description, though of another species?—No, not of that size; there is a fine camel's skin, but it would be very expensive to set that up; I do not know where we could put it. I had proposed to have some of the large animals placed in the centre of the saloon, but on speaking with Sir Henry Ellis on the subject, he begged that I would not think of proposing that, for the saloon is already obliged to be propped in the centre, and he was afraid, and with great reason, if any attractive objects were placed in the middle of the area, the crowd they would draw to that part of the room might occasion the floor to give way, and for that reason I have not had the camel set up and placed there.

2831. Would not the removal of some of the bad specimens make room advantageously for some good specimens?—I think it would be better to let those wait till we get more room, and put them up then; there are not many now; they were overhauled the other day, and those which I alluded to as coming in this morning, formed part of the skins then selected for being set up. I think it is better to let what are exhibited continue as they are at present, and when we get more space we shall leave none in the store chests; there are not many in the store chests now.

2832. Sir *Robert Inglis.*] It has been stated by Mr. South, in answer 1,177, that he is not aware whether the specimen of the kangaroo first brought to England be or be not in the Museum; that if it be, it is extremely valuable, as having been the first of the kind brought to Europe; can you state whether it be or be not in the Museum?—It is; it was also given by the College of Surgeons; that is in one of the glass cases in the saloon.

2833. Mr. *Hawes.*] Is it marked as the first specimen brought?—I do not think it is.

2834. Apart from that is it a valuable specimen?—Yes, it is a very good specimen; considering the age of it, remarkably good.

2835. In a scientific point of view is it a valuable specimen?—It is one that was born in the wild state, and is much larger than any other kangaroo I ever saw.

2836. Sir *Robert Inglis.*] Are the specimens of animals requiring to be stuffed sent ordinarily from the Museum to the stuffer, or does the stuffer ordinarily come to the Museum to work there?—The specimens which are to be stuffed are sent to Mr. Gould; but frequently, if we want any work of minor consequence done, such as new mounting, or taking specimens from one stand and putting them on another, Mr. Gould sends a person to the Museum to do it.

2837. Any work coming under the term specimens, to be adjusted or mended?—Yes. I believe that I stated on my former examination, that we twice tried the experiment of having a stuffer at home, but that it was attended with most signal want of success in both instances, and was a miserable failure in point of expense. I am satisfied it would be found much the most expensive of the two.

2838. Have you, or have you not, reason to be satisfied with the mode in which the work committed to Mr. Gould is done?—The highest reason to be most perfectly satisfied.

2839. In the examination of last year, in answer 3,206, and in the examination this year, in answer 1,154, a passage is quoted, in which you are made to speak of the bronchial sac of fishes; will you explain that to the Committee?—The fact is, that it

John G. Children, Esq.

28 April 1836.

it is a misprint; the term is simply a translation of Cuvier's term "sac des ouies." The *o* is misprinted for an *a*, *bronchial* for *branchial*.

2840. A reference has been made in former examinations, in answer 1,150, to the use of the term swimming bladder by you, and it has been assumed that you referred to Dr. Grew as an authority; did you refer to Dr. Grew as an authority in a physiological point of view, or as an authority merely for the use of the word, considering that Dr. Johnson had quoted, as an authority for the use of the word, the same writer?—I referred to Dr. Grew simply as being an author quoted by Dr. Johnson in proof of the meaning of the word. I never dreamt of Dr. Grew as a physiological authority in these days, but to show that his word swim was synonimous with the swimming bladder. As to the swimming bladder, I can explain a little further with respect to the authority for using it. Mr. South has declared there is no modern authority for its use; in answer to which, I have to say, that in the year 1815 Cuvier, in the "Mémoires du Museum d'Histoire Naturelle," vol. i. p. 1., published an elaborate paper on the maigre, and in that he particularly describes the *vessie natatoire*, or *swimming bladder*, of that fish, using that term constantly, both in the text and in the description of the plates. In the first edition of the Règne Animal, published in 1817, at page 141, the following expression occurs, "Mais il y a de plus une tres-grande vessie natatoire," &c.; and in the last edition of the same work, published in 1829, he repeats the same words, viz. "Leur vessie natatoire est grande," and so on; besides that, in his last work, which is still going on, (that is, in his great History of Fishes) he uses the same term continually; so that it is clear that he not only adopted that term almost from the first, but that he considered it the best he could employ, since he continued to use it constantly to the day of his death.

2841. Then, so far as Cuvier is an authority in natural history, especially that department to which he dedicated his latest and longest researches, you consider that the use of the term "swimming bladder" in the Synopsis is defensible?—I think it is not only defensible, but that it is the only term that ought to be used; because it does especially convey a meaning which explains the use of the organ, which the mere calling it an air bladder does not.

2842. Dr. Grant, in answer 1521, produces as an example of the confusion of the nomenclature, the description given of the Emu in the collection of the British Museum; will you explain to the Committee your views in reference to this point?—I do not conceive that there is any confusion at all; and the simplest way of making the Committee understand that, will be to state the facts with respect to the nomenclature: Temminck has adopted in his "Analyse," the genus struthio, for the common African ostrich (the Struthio camelus of Linnæus), and the genus rhea of Brisson, both for the American species (called the Nandu by the South American Indians), and also for the New Holland species, (the Casuarius Novæ Hollandiæ, or New Holland Cassowary of Latham), calling the first Rhea Americana, and the second Rhea Novæ Hollandiæ. On this Rhea Novæ Hollandiæ, Vieillot has founded his genus dromaius, and the bird he calls Dromaius ater, not dromiceius, as Dr. Grant has called it; though that name was formerly used at the Zoological Gardens, but I understand that it is now altered to the correct name as proposed by Vieillot: but we have not adopted Vieillot's name, because we do not adopt his system but Temminck's. I do not agree, therefore, with Dr. Grant that we ought to use the term dromaius.

2843. Mr. *Hawes*.] The nomenclature of how many authors have you adopted in reference to this one specimen?—Only Temminck's.

2844. Not also Dr. Latham's?—Latham's is the English synonym; we gene rally confine the specific names to Temminck, Linnæus and Latham.

2845. Dr. Grant also states, that "the cassuarius is an Asiatic bird, whilst it is designated in the British Museum as a struthio, which is the name of the African ostrich;" will you explain that?—I have not looked at the specimen lately, but I should rather think that the struthio is put in as the Linnæan name of the family.

2846. Then you are correcting this answer of Dr. Grant's, without having carefully inspected the nomenclature adopted with reference to this specimen?—I have stated what the fact is with respect to the nomenclature, but I am not aware that that stands at present as the struthio of Vieillot; the struthio of Vieillot is the African ostrich.

2847. Are you speaking now from your own personal examination, or from some

some paper put into your hand, giving you the examination of some other party? —From my reference to Temminck.

2848. Did you examine the specimen before you took upon yourself to correct Dr. Grant?—I have not looked at it very lately.

2849. Are you making this correction upon your own personal inspection, or upon the information of some one else?—Not upon the information of any one else, but upon the information of Temminck; I have not taken Temminck and gone to the specimen to see whether struthio is or is not upon the specimen.

2850. Sir *Robert Inglis.*] Does your original answer upon this subject, require the inspection of the specimen, or an examination of the authorities?—I consider that it required an examination of the authorities, not an inspection of the specimen.

2851. Mr. *Hawes.*] You do not know whether the specimen is actually named as described in the evidence?—I suppose that it is; I considered it entirely matter of reference to authors; I did not go to the specimen.

2852. Sir *Robert Inglis.*] The question first put to you upon this subject, assumed a state of facts as represented in the answer No. 1521, of Dr. Grant; assuming that state of facts, is it in your judgment a confusion of nomenclature or otherwise, that the specimen should be so named as there it is alleged to be?—No, I consider not.

2853. Mr. *Hawes.*] With regard to the latter clause of that answer of Dr. Grant's, with respect to the casuarius, do you admit the fact that the rhea is the American ostrich, and the dromiceius is the emu of New Holland?—The dromaius is the Emu of New Holland; I have stated that they are both Rhea of Temminck; the American bird is the Rhea Americana, the other the Rhea Novæ Hollandiæ, according to that author.

2854. And you think that Dr. Grant is not justified in adducing the naming of this specimen as an instance of confused nomenclature?—I think not; because Temminck does not adopt the name dromaius, and that, as I have said before, is the reason why we have not adopted it.

2855. Sir *Robert Inglis.*] You have been asked whether that paper, which you hold in your hand, was a paper put into your hand by somebody else; will you state whether such paper be or be not in your own hand-writing, made by yourself on consulting the authorities which you have now quoted?—It is made by myself, from consulting Temminck; it did not occur to me to go and examine the specimens. I had seen them not long before, and though I was perfectly aware how the fact was, I consulted Temminck to see whether they corresponded or not with his nomenclature, and I found, according to my recollection of the specimens, that they do.

2856. Dr. Horsfield, in his examination before this Committee, was understood to speak of the great importance of insects, as affording the means of studying and working out the natural system; do you agree with him in that opinion?—Perfectly; though perhaps I am not so sanguine as Dr. Horsfield in my expectations of the natural system ever being perfectly made out.

2857. Towards that object, and generally for the classification of insects, do you think that a series of dissections of insects, showing all the essential parts from which their principal characters are derived, would be desirable?—Most important.

2858. Have you ever suggested the acquisition of such a series to the Trustees?—I have.

2859. How was your suggestion received?—It was readily assented to; Mr. Westwood has already completed a great many dissections at my suggestion; and tables for their reception have been ordered; and I hope it will not be long before they will all be completed; and as soon as they are, and we shall have got the tables to put them in, they will be exhibited to the public.

2860. Has there been any increase in the establishment of the zoological branch of the Natural History department since you were attached to that department?—Yes, considerable.

2861. What has been the increase?—There has been the very important addition of Mr. Gray and his brother, and recently of Mr. Adam White.

2862. Any attendant?—One attendant, Frederick Saunders.

2863. Were you consulted with reference to those arrangements?—They were all made at my own suggestion. When I first came into the department of Natural History I was transferred from the department of Antiquities, at the suggestion of my lamented friend Sir Humphrey Davy, to the department of Natural History,

John G. Children, Esq.

28 April 1836.

History, against my own wish, and almost without being consulted. Sir Humphrey Davy was the representative of science at the Board, and of course his suggestion, for it was entirely his, was listened to by the other Trustees. At that time I did not pretend to be a naturalist; I found myself, in consequence, thrown into a situation in which there was an enormous deal to do, and a great deal to undo, and I necessarily found myself very much embarrassed how to proceed. The first time I had the pleasure of seeing Mr. Gray he kindly offered his gratuitous assistance; and for a considerable time Mr. Gray continued most essentially to assist me, without any remuneration. After going on thus for a good while, I found the absolute necessity of more assistance in the department, and then I applied to the Trustees, and recommended Mr. Gray, who was immediately appointed. Subsequently to that, as the business of the department increased, I found it necessary to have still further assistance, and I then recommended Mr. George Gray, and more recently Mr. White; and in all those instances the Trustees readily listened to my application, and, after having given it due deliberation, they in each instance granted my request.

2864. Mr. *Hawes.*] Do you wish to alter your evidence of last year at all?—I am not aware of anything that I wish to alter, although it is possible enough that in this chair a person may say what might require correction when he sees it in print.

2865. Are the Committee to understand from the evidence you have given in reference to the catalogue, that there is anything like a good general catalogue in progress of the zoological collection?—In progress, but not complete; it is but lately that it has been undertaken.

2866. How long ago has it been undertaken?—I understand that Mr. Gray began it two years ago.

2867. It has only lately been brought under your notice?—I am aware that it has been going on, but I cannot speak as to the exact time when it began.

2868. Were you consulted as to the mode and the sort of system to be adopted? I wished Mr. Gray to show me a plan; he suggested one, and I highly approved of it. I think it is the best plan for a catalogue of that kind that I have ever seen.

2869. Is it advancing rapidly?—It is advancing as rapidly as the strength we have will allow. There are so many things to be done of different kinds, that progress is made sometimes in one thing and sometimes in another.

2870. You deem a catalogue a work of essential importance connected with a National Museum?—Certainly.

2871. Having recommended assistance for the purpose of arranging the collection, how is it that you have not thought it a part of your duty to recommend assistance for the formation of the catalogue?—I was in hopes that we should be able to do it ourselves without any further assistance; I have stated already in my former evidence, that I have always had reluctance in applying to the Trustees knowing the difficulties they have to encounter, if they suggest anything to the Government that may be attended with any very considerable increase of expense.

2872. Are you of opinion that the mammalia, for instance, are not susceptible of any better arrangement even in the present state of the Museum?—I do not know how they could be got into anything like a good arrangement in the present state; I consider them in transitu, and we are obliged to put things where we can find space; it is like a crowded library, where for want of room one cannot put a book into its proper place according to its subject, but is obliged to place it according to its size.

2873. It has been stated that the mammalia have much increased of late; was there ever a time when there was a trace of anything like a systematic arrangement?—There is a trace now.

2874. Was there ever a stronger trace than there is now?—I do not know that there was a much stronger trace; it has been according to circumstances.

2875. You have been asked a question respecting the comparative superiority of the French collection over the British collection, more particularly of the mammalia; will you give the Committee your opinion more definitely upon that point?—I believe I set out with saying, that I am not well acquainted with the French collection, therefore I do not know how I can give it more definitely.

2876. Then it may be more numerous, it may be in better condition, and it may be more valuable for anything that you know?—I understand that they have a great

a great deal more space than we have, and therefore I conclude that it is in a better state of arrangement.

2877. From the reputation it bears amongst naturalists, can you state whether or not it is not considered highly conducive to the ends of science?—I have never doubted that it is highly conducive.

2878. In that point of view, as compared with the British collection, what should you say?—I state this, that *quoad* its better arrangement in consequence of having greater space, it probably may be, as far as the arrangement goes, more useful; but with respect to the facilities of access and permission to artists, or to students, to consult the collection, as much as they please, and with respect to the length of time during which such facilities are afforded them, I say without hesitation, speaking of my own knowledge of the Paris Museum, which goes back only to one visit, and that several years ago; speaking from what I saw and learned then, I should say that the facilities are incomparably greater at the British Museum than they are at the Jardin des Plantes.

2879. But nevertheless the Paris collection has been more conducive to the ends of science?—No, I do not say that; I say that inasmuch as the accommodations there admit of a more perfect arrangement, it may, *quoad* the arrangement, be more conducive to the ends of science; but in other respects, as to facility of access, &c., I say it is not; at least, I consider so. I conceive that there is greater facility of getting at ours by any person who wants to examine it.

2880. The question does not refer to the accessibility, but to scientific utility?—I think the scientific utility depends entirely upon the facility of access.

2881. You think an easy access to a middling arranged museum would be better than a difficult access to a well arranged museum, with reference to the purposes of science?—Supposing the difficulty of access to the well arranged museum were about proportionate to its superiority in point of arrangement, I should say they would be as nearly as possible equal.

2882. With regard to the new buildings, since your last examination have you ascertained at all the probable accommodation that may be afforded to the natural history collections?—No; I understand that there will be a very considerable increase of space, but I have not seen any details upon that. I understand that there will be a very considerable space.

2883. Have you heard how the larger apartments in the two wings now building will be appropriated?—No; nothing distinctly.

2884. Have you, or has any other officer of the Natural History department, as far as you are aware, had any communication with the architect or the trustees on the subject of the exhibition of the natural history collection in the new buildings?—Not as to details.

2885. In what respect have you had any communication?—I have not had any official communication with the architect about it.

2886. To what extent is the identification of species, and the naming of specimens, left to Mr. White?—Simply with respect to the British birds; simply to find in Jenyns what is the name corresponding to the name of Temminck, which was previously attached, and then to adopt Jenyns's names instead.

2887. Have you carefully gone over that portion of the work since?—I have not since; I have not had time to do it. I have looked here and there occasionally; and as far as I have looked he has done it very correctly.

2888. General Hardwicke left a very magnificent bequest of an entomological collection, as well as other things for the Museum?—Yes; there were insects among them.

2889. Did they remain for any considerable time unexhibited?—They were put by Mr. Samouelle into the cases as soon as he could get them in.

2890. They were not for any considerable time inaccessible to the public?—Not for any considerable time; I had them under my care some little time to look over them.

2891. Were they compared with the catalogue which accompanied them?—I suppose that Mr. Samouelle did so, if there was one; I do not recollect any catalogue of the insects.

2892. During the hours that Mr. Gray is officially employed in the Museum, are you able to state whether he is exclusively working at either the catalogue or the arrangement of the specimens?—His work upon the catalogue and at the arrangement goes on simultaneously; he inserts the species in the catalogue when he makes the arrangement.

John G. Children, Esq.

28 April 1836.

2893. Is there any record kept of his daily attendance, or of the progress of the work entrusted to him?—I am not aware of any record being kept, he is very punctual in his attendance.

2894. The official duty he has undertaken is entirely discharged to your satisfaction, and the whole time required is filled up in the discharge of it?—Yes; with those occasional interruptions which Mr. Gray, like every other officer of the Museum, is subject to. For instance, at the late visit of Dr. Beck to this country to examine the shells, a great deal of Mr. Gray's time was necessarily devoted to him; he could not have gone over the collection without Mr. Gray at his elbow. Those interruptions Mr. Gray is subject to like every one else.

2895. But save and except those occupations he punctually discharges his duty to the Museum, and he has no private work or occupation which interferes with the duty required of him by the Trustees?—I am not aware of any.

2896. Sir *Robert Inglis.*] Will you state what is your opinion of the value of Mr. Gray's services to the Museum?—I think the best thing I have ever done for the Museum was recommending Mr. Gray.

2897. *Chairman.*] What is the christian name of the Mr. Gray you are now adverting to?—John Edward. It is but justice to Mr. Gray to say, that ever since he has been in the Museum he has discharged his duties with equal ability and fidelity. If Mr. Hawes's question referred to his work upon the Indian Zoology, I am certain that I never saw Mr. Gray at work upon it when he ought to have been at work upon the business of the Museum. I believe it has been wholly executed at his own home; and all that I have seen of its being in progress has been the artist drawing for him occasionally in his room in the Museum.

Mr. *John Edward Gray*, called in; and further Examined.

Mr. *John E. Gray.*

2898. Sir *Robert Inglis.*] YOU have heard the last questions and answers to Mr. Children; will you state to the Committee under what circumstances you engaged in the publication of the Indian Zoology?—I undertook to edit the work on condition of General Hardwicke's supplying the money for the publication; he receiving from me copies to the amount, and the remainder becoming my own property. I have not received any pecuniary advantage from it, but am out of pocket to a considerable amount. General Hardwicke's affairs are now before the Court of Chancery, and it is difficult to say when they will be arranged. On undertaking the work I made a distinct arrangement with him that all the materials, whether drawings or specimens, employed in its completion, should eventually become the property of the Museum. From this arrangement arose the Hardwicke Bequest, which has been several times mentioned before this Committee. I may add, that it was with the view of assisting in the publication of this work, and furnishing materials for another in which I was engaged with General Hardwicke, that the large collections of objects of natural history from China, presented to the Museum by the two Messrs. Reeves, were given to the national establishment.

2899. What is the number of the mammalia in the British Museum?—About 405 species, and 750 individuals; all but a very few are exhibited in the cases.

2900. What number are there in any foreign museum?—In Paris, according to Deleuze (the latest authority I can find), there were, in 1823, 500 species, and 1,500 individuals. They occupy six moderately sized rooms, with the larger specimens in the centre.

2901. On what authority do you state these numbers?—With regard to the Paris Museum I take them from Deleuze's "History of the Garden," published in 1823; and the more modern ones, when given, I take from the reports made by the professors to the Minister of Public Instruction at the beginning of 1835. Whenever I refer to the numbers at Leyden, they are from materials furnished me a few days ago by the conservators of that museum. Those respecting Berlin are from the numbers stated in the Guide to that museum, published in 1818. The museum is now being rearranged. In Leyden there are 661 species of mammalia, and 2,016 individuals. They occupy 567 feet of cases, and a raised platform 280 feet long and six feet wide, which is covered with the larger specimens, exposed to the open air. The continental collections chiefly differ from ours in having more of the larger animals and more specimens of the same species.

2902. What number of mammalia are described in the works of authority?—In Fischer's Synopsis there are 1,126, and nearly 200 of these may be considered

as doubtful. We know about 100 which have been described or discovered since that time, so that there are about 1,000 certain species, of which we have two-fifths.

2903. Have you in the Museum any very rare or any unique specimens of mammalia, being type specimens of genera?—We have a considerable number which M. Temminck of Leyden, M. Jourdain of Lyons, and other foreign naturalists, have come to this country on purpose to examine. I will give the names of a few: as helictis, rhizomys, peudomys, heteromys, barbastellus, brachyphylla, monophylla, arctibeus, medateus, and many other genera of bats, &c. We have besides these, many new species of paradoxurus, pteromys, felis and viverra, spermophilus, mus, &c., which, like the genera above-named, have been described from the specimens in our collection; and many of them still remain unique. We are rich in mammalia from India, China, the Straits of Magellan, New Holland, and the Northern regions, many of which, I believe, are almost peculiar to our collection. Indeed, many of them are certainly unique.

2904. What proportion of the mammalia are catalogued?—Certainly three-fourths of the species; I might say four-fifths; all indeed but the pecora, and those that have arrived within the last two or three months.

2905. Is it your custom to exhibit the scull in the collection of mammalia so as to show the character of the groupes?—Yes; but we have no general collection of skulls. The larger skulls and the skeletons which we possess, illustrative of the three great tribes primates, feræ and ungulata, are placed in the cases with the corresponding specimens, or otherwise exhibited when they are too large for the cases. The smaller ones, as of the cheiroptera, insectivora, and glires, are kept in a cabinet for reference.

2906. Would there be any difficulty in adding considerably to the mammalia, if you had more space?—Certainly not. We might add many more species, chiefly of the larger kinds, in which the greatest deficiency exists. A small addition of these larger animals would make our collection look richer, but would require considerable space for their exhibition.

2907. And that deficiency can easily be supplied?—Yes; because it consists chiefly of the species which are often brought to this country in skins, and are most generally to be seen in the menageries, such as lions, tigers, leopards, hyænas, bears, antelopes, deer, goats, sheep, &c.

2908. You have stated that the cases are small and insufficient for the specimens which are now accommodated therein, were they, at the time when they were made, sufficient for the collection as it then stood?—In 1832, when those cases were first employed, there was very good space for the specimens, which were regularly arranged in two series. We have since deepened the smaller cases, but the animals are now exceedingly crowded from the great additions which have since been made.

2909. Are any of the species which are exposed liable to be injured by such exposure?—Certainly not; they are almost all of the thick-skinned kind, or such as are destitute of a woolly under coat, as the zebras, camelopards, tapirs, &c., for which reason they are not liable to be attacked by moths. The giraffes we received from Mr. Burchell are as good as when they were first stuffed. In the museum of the Zoological Society there are a considerable number of specimens, including a giraffe, which have been exposed for several years; and they are now in a good state. We have an antelope which originally formed part of Sir Hans Sloane's collection, which has been exposed for 60 or 70 years, and is now in as good a state as ever it was.

2910. In the collections on the continent, as at Paris, Frankfort, and Leyden, are such animals equally exposed?—They are. In Leyden they have open platforms railed round, which, together, cover 1,680 square feet of surface, occupied with their larger animals. In Paris the larger animals, such as the deer, dromedaries, elephant, &c., are placed in the centre of each of the rooms without protection from dust.

2911. How many animals are exposed in the British Museum?—The number of mammalia is very small; not more than 15.

2912. Are they "the rarest and most interesting of the specimens?"—No; and if they were, none are put out but those that are of such a nature as not to be liable to injury by exposure; nor do I think that any of them are very rare. Four, a hippopotamus, the koudou, the elk, and one of the giraffes, were exposed

Mr. *John E. Gray.*

28 April 1836.

at the College of Surgeons for years before we received them, and some of them had previously been exposed in the Leverian Museum.

2913. Have those which are so exposed their scientific names attached to them?—They all have the English name of Pennant, whose work is a highly scientific book, and well known to all zoologists. Most of them have both the English and the Latin scientific names.

2914. Mr. *Hawes.*] There are very few of those exposed specimens, and those few are all named?—Yes, all. When I go back to the Museum there will be more exposed than when I left it; because the last thing I did was to order certain of the large animals which had formerly been exposed to be taken out of the cases to make room for others which have been recently stuffed, and were sent home this morning.

2915. Sir *Robert Inglis.*] Have you any mammalia in store?—Very few, indeed. I do not suppose we have more than 30 or 40 skins; those that we have are all large specimens, imperfect skins, or duplicates.

2916. Have you room to show them if they were set up?—Certainly not; and some of them are too bad or imperfect to be stuffed, although still useful for zoological purposes; this is especially the case with some deer skins, which are unique in the collection.

2917. Do you ever stove specimens now?—We have not stoved any specimens for the last seven or eight years. We have not found it necessary; for by using tobacco, spirits of turpentine and camphor, the animals are preserved from moth or from any necessity of stoving. Formerly, when all the few animals we had were exposed, such as are liable to moth were attacked, and it was then necessary to stove them.

2918. What number of Mr. Burchell's specimens have been received into the British Museum, and what proportion have been exhibited?—In Mr. Burchell's list 43 are noted; but we have two specimens which were not in his list, and there are two in the list which I never saw in the Museum; 17 of these have been stuffed, and are now in the cases. Mr. Burchell has himself verified the specimens. Twenty-six are not exhibited.

2919. Mr. *Hawes.*] How many years ago was it when they were presented?—It was in 1817, in Dr. Leach's time, when there was no space for their exhibition. Those that we have in store are quadrupeds. Mr. Burchell's skins, although very rare at the time they were presented, have, many of them since by our increased intercourse with the Cape, become more common.

2920. Sir *Robert Inglis.*] Have the officers of the Museum abstained from stuffing them in reference to any wish on the part of Mr. Burchell, or in reference merely to the want of space for exhibition?—There was, at the time of their reception, no space for their exhibition; those were afterwards stuffed which would bear exposure, there being no room for glazed cases to contain mammalia; but for some years after their arrival, I understood from Dr. Leach, that it was the wish of Mr. Burchell that they should not be stuffed until a certain time had elapsed in order that he might describe them in his Travels. In confirmation of this I may observe, that I perfectly recollect Major (now Colonel) Hamilton Smith applying to Dr. Leach for permission to draw them, and his being told by Dr. Leach that he could not have that permission for the reason above given; on which Major Smith applied to Mr. Burchell, obtained his permission, and drew them. I assisted him in looking them over, and measuring them; and most of them are figured and described by him, in Mr. Griffiths Animal Kingdom, from the drawings and from the notes then taken.

2921. In other words, you wish the Committee to understand that they were not exhibited in order that Mr. Burchell might himself have the advantage of describing them, which might not have been the case if they had been equally open to every eye?—Dr. Leach several times in conversation told me that that was the case; and the subsequent reason was want of space.

2922. Mr. *Hawes.*] You have not Mr. Burchell's authority for it?—I have only the authority of Dr. Leach in conversation. In speaking to Mr. Burchell upon the subject recently, he recollected Major Smith's application to him, and the object of it.

2923. Was that in the course of last year?—I think it was. Mr. Burchell sent me a catalogue of the specimens which he had printed, and afterwards came to see the present state of the specimens. We had some conversation about them, and

he

he perfectly recollected the circumstance of Major Smith calling upon him for the purpose which I mentioned.

2924. Sir *Robert Inglis.*] You have been present in the room at the time when Mr. Children was examined, upon the subject of the transfer from the College of Surgeons to the Museum of the giraffe, and the lama, and the antelope?—Yes.

2925. Do you concur in stating that they are in the same condition as when they were received?—Certainly; I would also add, that it is a common custom when a skin is without a skull, to make a plaster cast of the head; the same thing has been done with the tapir. Both these animals, as well as the elk, were originally in the Leverian Museum.

2926. Are they in the same state now as when they came to you?—Entirely.

2927. The Museum possesses a fourth specimen of giraffe?—Yes: which was given by Colonel Denham, and brought from the centre of Africa; it is a most beautiful specimen; a young specimen of what is considered as forming a second species.

2928. Dr. Grant has referred, in answer 1,523, to the surprise which an intelligent visitor would experience on finding "the limited space available for exhibition filled with 20 cats placed together, 25 mice, about as many rats, nearly 50 squirrels, 20 specimens of hares and rabbits, placed as if to prevent the public from seeing that there were so many of the same objects in different parts of the collection." Will you explain the fact, and the reason of such fact?—I have looked over our collection, and I find that we have 48 specimens of squirrels, which belong to 29 different species: of these 16 species have only one example, eight species have two, four species have three, and one species has four examples. Of the common European squirrel we have only three specimens, one of which is an Alpine variety; of the so-called rats and mice there are 42 specimens, which belong to 19 species; there are eight species consisting of one specimen each, six of two, one of three, one of four, and three of five specimens each.

2929. Mr. *Hawes.*] There are duplicate specimens of those valuable animals?—Of some species there are five specimens, varieties of age, of size, and of colour, black, white or mottled, and frequently so unlike one another that it is important to keep them; one of the specimens of the common rat has elongated front teeth; of these 19 species of rats there are no fewer than eight which are perfectly new to Europe, and not to be found in any other collection. They were collected in southern India, and presented by Mr. Walter Elliot.

2930. Sir *Robert Inglis.*] Therefore the statement to which your attention has just been called gives not only a very inadequate but a totally erroneous view of the character of the collection to which it relates?—If it was intended to convey an idea that all our specimens, or a large proportion of them, belonged to the commonest species of each genus, it certainly does.

2931. Mr. *Hawes.*] With reference to the hares and rabbits, what do you state to be the fact?—Of the hares and rabbits, some species are in the large case and the remainder in the smaller cases; like the squirrels, rats and cats, they belong to many different species, of several of which we have only single specimens. The difference in size and want of space are the only reasons for placing them in different cases. In none of these instances are specimens of the same species placed in different cases.

2932. As to the cats?—Of the cats there are 25 specimens, which belong to 18 species, 12 species of one, five of two, and one of three specimens; and of these cats there are two or three new species peculiar to the collection.

2933. Having stated that that answer gives an erroneous impression of the collection, will you state your opinion of this remark of Dr. Grant, in a part of the answer which has been referred to: "In most other departments of the zoological collection, the British as little stands a comparison with that of the Garden of Plants at Paris?"—In the Garden of Plants at Paris they had, in 1823, 500 species of mammalia, we have 405; our collection may consequently stand a fair comparison with that of Paris, although not equal in extent. There are in the Paris collection a much greater number of specimens of the same species, and of varieties of the domestic animals, such as dogs, sheep, goats, &c. I am certain that the Museum collection is nearly, if not quite, as completely arranged.

2934. Which is richest in the more rare species?—Each has many species peculiar to itself; we are richer in some genera, and the Paris collection in others. In proof of this I may again observe, that M. Jourdain, M. Temminck, and other continental zoologists publishing on mammalia, have thought it neces-

Mr. *John E. Gray.*

28 April 1836.

sary to come and consult our collection, with the view of examining the specimens contained in it, which are not to be found in any other. M. Lichtenstein, director of the museum at Berlin, in a late visit to this country, during which he was several days occupied in examining the collection of mammalia and birds, remarked that he had never seen a collection which had increased so much in so short a space of time. And since that time we have received from various quarters, and from India and China especially, many entirely new objects.

2935. How is the collection with regard to the skeletons of vertebrated animals?—We do not profess to have a collection of skeletons; such objects are rather to be sought in the College of Surgeons. We have only a few skeletons for the purpose of illustrating the osseous structure of the several orders. For example, we have the skeleton of a long-armed ape and a lemur among the primates; a paradoxurus and a petaurus among the feræ, and an elephant as a specimen of an ungulated animal, to assist in explaining what is requisite for the general zoologist, not for the anatomist. In Paris there is no other public establishment in which comparative anatomy is attended to. In London we have the College of Surgeons, the museum of which is in great part public property, and which precludes the necessity of any second public collection in that department of science.

2936. Sir *Robert Inglis.*] Dr. Grant's answer quoted, referred to the separation of the specimens of different cases, as if with the intention of preventing the public from seeing that there were so many of the same objects in different parts of the collection; will you explain why that separation, assuming it to exist, has been made?—There were three specimens of hares much larger than the rest placed in the larger cases, because there was not good room for them in the smaller. They did not belong to the same species as those in the smaller case; I believe that they will now be crowded into the latter for the purpose of making room for the larger animals received this morning. The insinuation at the close of the answer just read to me is preposterous.

2937. You have stated that certain of Mr. Burchell's specimens and certain other specimens are unstuffed; are the skins so unstuffed open at all times to the examination of those who want to consult them for scientific purposes?—At all times. Mr. Ogilby, who is engaged on a work upon the antelopes, has frequently examined them, and has had drawings made of some of Mr. Burchell's; and if any person comes to consult the collection with a special object, it is the general rule to show him what we have in store as well as those which we have stuffed and exhibited in the cases.

2938. Mr. *Hawes.* They are to be considered as *bonâ fide* open to the public?—Decidedly.

2939. And known to the public that they are so?—If a person desirous of examining the specimens of a particular group applies to me (and he cannot examine them for any zoological purpose without a closer inspection than the cases admit of), and inquires, "Have you got such a specimen; or, will you show me all the antelopes (for instance) that you have." I should show him all the antelopes, both those in the cases and those in store. If he says "I want such and such a specimen," I go to the place where it is, whether stuffed or in store, and produce it for his examination.

2940. Sir *Robert Inglis.*] Dr. Grant, in the same answer, stated that in the Museum "there is neither elephant nor rhinoceros, camel nor dromedary, lion nor tiger, walrus nor dolphin;" with respect to the first, the elephant, will you state what opportunities there have been of procuring; and, above all, what opportunity there is in the present state of the Museum of exhibiting any specimen if procured?—There is not at present any good and available space for exhibiting such a specimen: as to opportunities of procuring, we might frequently procure an elephant's skin; but I do not believe there is a single stuffed specimen of a mature elephant in England. It seems not to have been thought worth while to incur the great expense of stuffing an elephant, as they are so common in our menageries. The fact is, that to stuff an elephant is a matter of extreme difficulty, and I do not think it has ever been done well. If we had a stuffed elephant given to us to-morrow, I should have great difficulty in finding a place for it.

2941. Do you consider it to be more desirable, in such a collection as the British Museum, to exhibit animals which are not known alive in this country than to exhibit animals which are known to every spectator of the common shows of the country?—I should think it much better to exhibit the rarer animals, especially

245

Mr. *John E. Gray.*

28 April 1836.

cially those which are not brought to this country alive. In stuffing quadrupeds, I may observe, we rarely succeed as we would wish; and it is far better that the rare and uncommon ones should be preserved in the Museum, and especially such smaller ones as are scarcely ever brought alive, than that we should devote our space to animals which may at any time be seen living, and go to a large expense in preserving them.

2942. Has the difficulty of stuffing elephants been experienced in France?—Du Fresne published a work on Taxidermy, which contains a long chapter on the difficulties which were experienced in the Paris Museum in stuffing an elephant; and I have seen, in the laboratories of Paris and Leyden, two large engravings representing the process. They thought the process an affair of so much importance, that they actually had engravings made of the means employed; they formed an entire frame-work of wood, and put the skin on in several pieces.

2943. As an object of science, it does not appear to you to be necessary; and as an object of curiosity, it does not appear to you to be very desirable, considering that the live animal is so commonly seen in this country?—Not so desirable as many other specimens. We have four living specimens in London at the present moment; but this answer would not apply eqnally upon the Continent, where these animals, and even lions and tigers, &c. are extremely rare, as they have not the same facility of procuring live animals that we have here.

2944. Lions and tigers being common in the menageries of professional exhibitors, you do not consider that the exhibition of stuffed specimens of those animals in the British Museum is essential to its character as a national museum?—Certainly not; I consider that there are many other objects far more desirable.

2945. At the same time, if there were adequate space, you would be willing to receive and exhibit such?—Yes; immediately that we obtain sufficient space, I should consider it an object of great importance to collect such animals, and many others; I would exclude none; but I should greatly prefer the rarer animals to the more imposing but better known forms. Until we have sufficient space, however, I think it better to pay attention to those animals that are most important. I have always endeavoured, as far as possible, to complete our series of genera, and would much rather acquire a rare though small species of cat, than so common and well known a species as the lion.

2946. In your first examination you stated that you would supply the Committee with a statement of the number of specimens of birds in the Museum; are you prepared to state that now?—We have 2,400 species, and 4,659 individuals; of these nearly 3,000 have been added within the last four years.

2947. What is the number in the chief foreign museums with which you are acquainted?—In Paris, according to Deleuze, there were, in 1823, 2,300 species, and 6,000 individuals. In the report of last year the professors do not state their number. In Leyden there are none exhibited; but I am informed that there are between ten and twelve thousand individuals, which are about to be exhibited in two rather narrow galleries, each 100 feet long. In the Berlin Museum they had, in 1818, 1,200 species.

2948. What is the number of species described in the most complete works on ornithology?—The largest enumeration that I have seen amounts to about 4,000 species; it will be found in my notes in "Griffith's Animal Kingdom."

2949. In what order do you consider that the British Museum is specially rich?—I think that the collection of birds is nearly equally rich in all the orders; but in the gallinaceous birds we are extremely rich, and we have many very magnificent specimens. This arises from the circumstance that the most splendid gallinaceous birds come from India. Of this order we have many species, and one or two genera even, which are peculiar to our collection; we are also rich in African and Brazilian birds, and in those of the Northern regions. We are most deficient in the smaller and more delicate birds, such as humming-birds, and in the birds of Europe. Most of the latter may readily be procured from the Continental dealers, when we have greater space; but less attention has hitherto been paid to them, because a large proportion is in the British collection.

2950. Were you acquainted with the collection of birds formed by the late Mr. Sowerby?—I knew it very well; it was a collection of British birds.

2951. Are you acquainted with the mode in which birds are stuffed or made up in the Paris Museum?—I should scarcely say "made up." I have been several times in the laboratory (as they call the room in which the animals are stuffed

Mr. *John E. Gray.*

28 April 1836.

in the Paris Museum), and I have noticed that they frequently make their birds look much smoother by taking the feathers out from one part and fixing them in another with gum.

2952. A late witness has described the process in a manner which justifies the application of the phrase "made up," to the specimens there exhibited, for he has stated that the wing of one bird might be transferred to the body of another?—I have not seen that done; I have seen a bird which was said to represent the sociable vulture, but it was not that species, but another artificially made to represent it. I believe, however, that it was purchased by the Museum in that state.

2953. Looking at that practice as a man of science, do you consider it advisable or reprehensible?—It is very wrong. We had formerly in the collection of the Museum a made-up specimen, called the harlequin humming-bird, which I believe was destroyed by Dr. Leach. It was ejected before my time.

2954. Can you state the reason why you have not adopted it in the British Museum?—I never would adopt it, because it would be impossible to depend upon a description made from a bird so stuffed; and if I knew that any bird in the British Museum was in that state, I should recommend its being destroyed. This does not, however, apply to the case of a very rare bird, which may have lost some of its tail feathers in confinement, having those feathers replaced in their situation when stuffed.

2955. You would prefer having a less plausible collection, such as that in the British Museum, to a collection improved in the French style?—Yes. I do not believe that the kind of improvement to which I have referred is peculiar to the Jardin des Plantes. I believe it is the custom in Paris with most of the bird-stuffers, which makes English collectors suspicious of French specimens when offered for sale. I may observe, that almost all the birds of Paradise which come to this country are without legs, and it has long been the practice to supply them when stuffed with false legs; but this is too well known to all zoologists to deceive.

2956. From your observation of the taste of your countrymen, do you consider that the collection of birds may be regarded, generally speaking, as the most attractive part of a museum?—Yes. I have no particular attachment to birds, myself, but I know that in most museums they form the most prominent as well as the most beautiful part of the collection.

2957. And therefore if a large space be allotted to them in a popular exhibition, you do not consider it a misappropriation of space?—By no means; almost the only popular part of the zoological collection at Paris is the gallery of birds; it is three times the size of any other room in the museum. At Frankfort, the largest room is devoted to birds; it occupies at least one-third part of the entire museum.

2958. What is the most numerous class of vertebrated animals?—The birds; they are much more numerous than the quadrupeds or reptiles, and even more numerous than the fishes. There are four times as many birds known as quadrupeds or reptiles.

2959. Viewing it either as an exhibition of science, or as an exhibition of objects of popular interest, do you consider that a collection of birds requires a larger space and more specimens of each species than would be required in any other division of the Natural History department?—Certainly; firstly, on account of their number; secondly, on account of their beauty; thirdly, on account of their occupying a greater space for the due display of their plumage; and lastly, on account of the changes which they undergo in their various stages, and the differences between their sexes, on which account more specimens of the same species are required among them than in any other class of animals. In the Paris collection, says M. Deleuze (vol. 2, p. 335), "We frequently see 10 or 12 individuals of one species presenting the same essential characters, but whose colours are totally different. Besides the diversity of the males and females, the same bird is quite different at one, two, or three years of age; as also, if it has been killed in summer or winter."

2960. Are not the specimens in the British Museum very much crowded?—Very much; some of them are obliged to be put under the shelves behind others, and many of them are necessarily put further back than they ought, to be well seen; but this is done in order to make room for the exhibition of all the species we possess.

2961. Do you attribute the deficiency of objects and the crowded state of those which you possess to the transition state of the Museum, and the consequent deficiency

ciency of space, or to any want of interest in the objects of the collection on the part of the governing body, or the officers in charge of the department?—It is partly owing to want of space, but not at all to a want of interest on the part of the Trustees or officers; the best proof of which is, that almost the whole collection of birds has been formed within the last four or five years; 3,000 specimens have been added in the last four years, and many of the older specimens have been renewed, so that nearly the whole has been done within four years, that is to say, since space was afforded in the new buildings for the exhibition of the collection.

2962. It has been stated by Dr. Grant, in answer 1485, that the general collection of birds is still left useless to the public or to the student. Are you aware of any large number of species of birds which have been figured and described from the specimens in the British Museum?—A very considerable number.

2963. By whom?—By Mr. Griffith, Sir William Jardine, Mr. Lear, Mr. Lowry, Mr. Gould, Mr. Swainson, and indeed almost every naturalist who describes or figures birds. There is a work on British Birds now in course of publication by Mr. Myer, who has figured a considerable number of birds and eggs. Mr. Hawkins has also figured many of the birds. I might name many others; indeed I have already mentioned several in the course of my examination.

2964. Are artists in the habit of coming to the Museum for the purpose of drawing birds?—I left three zoological draughtsmen employed in making drawings when I came away this day; and we have constantly artists so employed, students as well as amateurs. It would be improper to omit the names of Mrs. Pope, Mrs. Withers, and other ladies, who make drawings from the collection, which are highly valued.

2965. Are most of the distinguished ornithologists in the habit of coming to the Museum to describe the species which they may require to describe?—Yes; all who are in the habit of describing birds.

2966. Dr. Grant has stated, in answer 1487, that the general visitor "looks in vain for the names sometimes of 50 or 60 specimens together, which have not a single name attached to any one." Distinguishing in your answer to this question between *naming* and *labelling* specimens, will you state what is the fact according to your view of it?—I have never counted the number of specimens, and therefore I cannot say that you may not find 60 specimens without formal labels giving the specific names; but it must be a very rare instance, and it must be amongst the smallest birds. But I doubt the fact. Every bird is arranged under its proper genus, and almost every one is numbered and catalogued. If it has not a formal label attached, it is at least catalogued, and the name of the donor and the habitat of the bird are given both in the catalogue and on the foot of the stand. Most of the birds which are not labelled are so named.

2967. Are all the birds arranged in genera?—Every specimen that we have is arranged in the genera of Temminck's arrangement, except some few that are unstuffed; but even these are arranged in orders, so that any bird, stuffed or unstuffed, may be at once referred to.

2968. Mr. *Hawes.*] Have you referred to Dr. Grant's evidence since he gave it, in order to ascertain where it is inaccurate?—I have looked at the evidence, and have made notes on it, which I hold in my hands.

2969. Will you refer to answer 1472, and inform the Committee whether that is an accurate statement or not?—That refers to the mammalia; and I spoke of that in my former examination with respect to the bats.

2970. Is the answer given by Dr. Grant generally correct?—I am quite certain that there is not a single specimen in cases No. 1 to 12, and 21 to 32, that is not named and catalogued. In cases 13 to 20 some are not catalogued, but the greater part of them are; they are all named.

2971. Are they all labelled?—No; I will not take upon myself to say how many are labelled, as we are adding labels almost daily; but I state positively that in the bat cases, from 25 to 32, every individual is named and catalogued.

2972. But the name is only to be found in the catalogue?—Yes, in several instances.

2973. Of which many of the scientific visitors have no knowledge?—I would not say so; because no scientific visitor could make any use of the bats without having the cases opened, and then he would apply to me, and if he asked the names, I should either give them to him or refer to the catalogue; but the names of many of the bats are also marked on their wings.

Mr. *John E. Gray.*

28 April 1836.

2974. Have not Mr. Owen and Mr. South stated that they both visited the Museum without knowing that there were such catalogues?—Mr. Owen, never, to my knowledge, visited the Museum for the purpose of making out the species of mammalia, or any other species of vertebrated animals. If he wanted to know the name of any object, he came and asked me what was the name of the specimen he had brought with him, and I have generally been able to give him the information at once.

2975. Sir *Philip Egerton*] The correct interpretation of the term "scientific visitor" you would state to be not a person of scientific eminence, who walks through the rooms as a superficial spectator, but a person who comes for the purpose of examining scientifically the specimens preserved in the Museum?—Yes; that is what I understand by it; a visitor who comes with a scientific object to consult the collection in a scientific manner.

2976. Mr. *Hawes.*] In question 758, Mr. South was asked, "You have not referred to such a catalogue." His answer is, "No, nor heard of them"?—I am not aware that Mr. South has ever consulted any part of the zoological collection with which I have any concern, except with a view to obtain plates for the "Encyclopædia Metropolitana." On such occasions he has generally either brought or sent a list of the objects which he desired, begging me to give the specimens to his artist to be figured, and I have always taken them out for him; so that there was no necessity to refer to the catalogue.

2977. In question 497, Mr. Owen is asked, "And you have not become acquainted with the existence of such catalogues?" His answer is, "I have not; I have obtained my knowledge of individual specimens, or series of specimens about which I visited the Museum, through the gentleman in charge of that collection." Now, is not that a case of a scientific gentleman visiting the collection, and referring to the gentleman in charge of the collection, and never being informed of the existence of a catalogue?—Yes; Mr. Owen's answer perfectly agrees with my former statement. He always got the information he wanted, and there was no necessity for referring to a catalogue. He brought, for instance, some specimens in bottles, generally insects; and said to me, "Do you know what this is; can you tell me the name." He did not ask to make any comparison for himself; his object was to obtain the name of a specimen, not directly in the line of his own studies, in the shortest possible way. I generally knew the name off-hand, and gave it to him; there was no necessity for referring to the catalogue.

2878. Sir *Robert Inglis.*] Dr. Grant has stated, in answer 1503, that a small bird, which appears one of the most insignificant specimens in the Museum, and which would not value 1 *s.* amongst ignorant collectors, is said to have cost 80 guineas; are you aware of the fact to which this answer refers?—We have a bird in the British Museum for which 80 guineas were given many years ago by Mr. Donovan; but it was bought by the Museum at his sale I think, for about 18 *l.* or 20 *l.*

2979. What is the bird?—It is the *cursorius isabellinus*, and it is valuable as being the identical specimen upon the authority of which the species has found a place in the English Fauna. It is rare in all parts of Europe, but was then unique as British; and to make our British birds complete, it was purchased at Mr. Donovan's sale. The history of the bird will be found in "Stephens' Continuation of Shaw's General Zoology," and in "Selby's British Birds." It is one of the rarest birds in our British collection.

2980. Continuing the distinction to which your attention has been called, between *names* and *labels*, are the Committee to understand you to say that the *names* are to be found in conjunction with the specimens generally?—Very generally they are written upon the base of the stand; if not, there is a number upon the stand, which refers to the catalogue; but it is not necessary to refer to the catalogue in most cases. The catalogue is also of use in preserving a knowledge of the specimens which we possess.

2981. In answer 1306, Mr. Vigors has stated, that "the collection of birds is rather poor compared with others. It does not contain, I suppose, the one-third it might contain had it adequate funds, by purchase and judicious exchange. I dare say in the course of six months the British Museum might treble the numbers of the species of birds it has at the present moment." Will you state what is the fact, so far as your judgment and observation enables you to state, in reference to the subject matter of that answer?—I should think that Mr. Vigors had not examined the collection since the Hardwicke bequest, which has added so greatly

to

to the birds. We have 2,400 species; and scarcely more than 4,000 have been recorded as existing in collections.

2982. It would not, therefore, according to your view of the state of the science, be possible to treble the number of the species of birds in the Museum in six months, or in any other time?—I believe it would be impossible to treble the number of species, if all the collections in Europe were thrown into one.

2983. Mr. *Hawes.*] Are you aware that Mr. Vigors stated that he visited the Museum at the latter end of last year, understanding that he should be called upon to give testimony respecting it?—I do not recollect it; but I do recollect that in another part of his evidence he speaks of from 1,500 to 2,000 specimens as the number which might be added. We have already 2,400 species, and 4,600 specimens.

2984. Are not the birds more especially under Mr. Children's care?—All the zoological collections are under his care; he superintends them, as he does all the other parts of the collection, and attends to this more particularly.

2985. Sir *Robert Inglis.*] Reference was made in the examination of Mr. Vigors to the expediency of effecting exchanges between the British Museum and other museums in this country; will you state any views which you have upon the practicability or the expediency of such system?—As I said before, I think it would be very difficult to make satisfactory exchanges; and I do not know that there are many collections in London which could spare us much we require; most of the things that we want would not be duplicates to them.

2986. The collections to which you refer do not possess duplicates, and therefore could not effectually exchange with the British Museum?—Not such duplicates as would be wanting in our collection.

2987. Does the British Museum possess many duplicates?—Very few.

2988. Dr. Grant has stated, in answer 1523, that "the collection of humming-birds is poor compared with that of Paris. It is poor compared even with those of some private collectors in this neighbourhood; as that of Mr. Loddiges of Hackney, or that of Mr. Leadbeater of this city." Will you explain the fact with respect to that?—Our collection of humming-birds is probably poor compared with that of Paris; we are not rich in humming-birds; but the Paris collection is likewise poor comparing it with the collection of Mr. Loddiges, or of Mr. Leadbeater. It is not likely that we shall ever have so fine a collection as either, because they have bestowed many years of their lives, and spared no expense whatever to perfect their collections in this one particular department. It is a collection which is their peculiar fancy, and has cost each of them many hundred pounds.

2989. Is that a general collection, or a monographic collection?—It is a monographic collection of humming-birds alone.

2990. Dr. Grant has also referred to the Paris collection of humming-birds; can you state anything as to the mode in which that collection was formed, or the object with which it was formed?—I believe that they paid great attention to it on account of the beauty of the birds, which renders them peculiarly attractive to the world at large. It is a fine collection, and has I believe been increased very much to assist M. Lesson in his illustrated monograph of the genus.

2991. Mr. *Hawes.*] Dr. Grant has also stated, that "the collections of hornbills, of strutheous birds, of toucans, and of birds of Paradise, are poor compared with those of Paris?"—Our collection of hornbills and toucans is very respectable; I have no means of determining the relative number at Paris. Of struthious birds we have all the known species, except the nhandu or American rhea. If it is poor compared with that of Paris, it can only be in number of specimens, and not in number of species, because that is the only one that we do not possess. We have two specimens of the common ostrich, young and old; and in Paris they may have a female and a nest of young ones in addition. I think in a conversation I had with Dr. Grant, he stated to me that it was his impression they had such a group.

2992. Sir *Robert Inglis.*] Dr. Grant has referred to the cassowary, and to the mode in which its neck has been made up with alternate daubs of red-lead and lamp-black; will you explain this to the Committee?—The two specimens referred to formed part of the Sloane collection; and it was, and indeed still is the common custom where birds have naked coloured parts, to colour the stuffed skins to represent the natural appearance in the living bird. This was done, in the present instance, a great many years ago; but we do not do so now. I believe it to be the only bird in the collection so painted; and I suppose that is the reason why it struck Dr. Grant. I believe in one specimen the colouring has been removed;

Mr. *John E. Gray.*

28 April 1836.

in the other it has been suffered to remain. It certainly is no detriment to the bird, and would deceive nobody. The specimens I may observe, although so old, are in excellent condition.

2993, Sir *Philip Egerton.*] Was it not generally the practice with respect to certain animals, having portions of the body bare, such as vultures and baboons, to colour them by artificial applications?—It was and still is the practice in many museums to colour such parts as lose their natural appearance, with the view of restoring them as nearly as possible to their natural state. We do not do so in the British Museum, on account of the difficulty of making them look natural. I believe the specimen referred to is the only instance in which it has been done in the Museum, and that occurred long before any of the present Trustees or officers had charge of the collection.

2994. Sir *Robert Inglis.*] In answer 1,521, Dr. Grant has stated, "the cassuarius is an Asiatic bird, the cassowary, and is designated in the British Museum a 'struthio,' which is the name of the African ostrich; the rhea is the American ostrich." Have you any observation to make upon that statement?—The name given in the Museum is perfectly correct, and strictly according to the system there adopted. The emu of New Holland is the "*casuarius* Novæ Hollandiæ," and the "New Holland cassowary" of Dr. Latham; and was first scientifically described under those names, which are therefore given on the specific tickets; but this bird was afterwards referred by M. Temminck, whose arrangement is followed in the Museum, to the genus "*rhea*," comprehending both it and the American emu; and that name is consequently placed on the generic ticket with the English synonyme of emu, which Dr. Latham uses for the genus "*rhea*." In like manner with the Asiatic cassowary; it was first scientifically named "struthio casuarius" by Linnæus, and that name is consequently adopted for the species; but M. Temminck places it under the genus "*casuarius*," and this name is given on the generic ticket. Dr. Grant has confounded the generic and specific tickets which are quite distinct, and has thus produced an appearance of confusion which does not exist.

2995. What is the number of reptiles in the British Museum?—We have 600 species, and 1,300 individuals.

2996. In Leyden?—In Leyden, my note from the conservator states that there are between 600 and 700 species, so that they have not accurately counted them; they occupy 142 feet of cases, nine feet high.

2997. In Vienna?—Fitzinger's catalogue contains 345 species.

2998. In the Berlin collection?—The Berlin collection in 1818 contained 280 species; but they have lately received some fine specimens from Mexico and Bucharia. When there, I purchased from them their duplicates of those reptiles which we wanted in the Museum.

2999. In Paris?—In 1823 they had 500 species and 1,800 individuals; they are now said to have 1,180 species; M. M. Dumeril and Bibron, who have the charge of this part of the collection, are writing a work upon the subject, and are making every effort to increase the number of species in the collection; but, on referring to that portion of the work which they have published, I find that they consider many specimens as species, which in our collection are regarded only as varieties. For example, the Indian tortoise, which we consider a single species, they reckon as four; so that the estimated number of species does not suffice to show that they are actually richer.

3000. Is the collection in the British Museum rich in rare specimens?—I should say that it is decidedly so. As a proof of it, I may state that among the snakes, out of 15 species of the family of boidæ, we have five new; out of 16 viperidæ, five new; out of 25 crotalidæ, we have 11 new species. In the lizards, of 40 species of geckotidæ, we have 26 new; and of 38 iguanidæ, 13 are new: in the chelonia, of 56 tortoises upwards of 20 have been described from our collection. Indeed so rich has this collection been considered, that M. Bibron, who is engaged, as I have just observed, with M. Dumeril in the publication of a general work on Reptiles, has paid two visits to this country for the express purpose of describing those species which they have not in Paris.

3001. Therefore the Committee are to understand that, both in the extent and in the choice of specimens, the collection of reptiles in the British Museum is of considerable value?—I have thought it of so much value that I some years since commenced publishing a distinct catalogue of that collection, in the form of a "Synopsis Reptilium," at my own cost; and I am now printing a second edition of it.

it. We have many genera from Singapore and Penang, which are not to be found in any other collection. General Hardwicke brought over a very large collection both of snakes and lizards; and we have also some of the original specimens figured by Russell in his work on Indian Serpents.

3002. What would you consider the richest part of the collection of reptiles in the Museum?—The Saurian reptiles.

3003. Then, when Dr. Grant includes the Saurian reptiles in his statement of that division of the zoological collection of the National Museum being an opprobrium to the British nation, you would not consider that such statement was correct?—I can only refer to my previous answer, and to what I have there stated with regard to the number of new species of lizards. Indeed a large proportion of the species we possess are undescribed.

3004. How far are those specimens labelled and named in the collection of the British Museum?—I believe that every species, and almost every specimen of reptiles in spirit, is named and labelled, except those of the genus coluber of Cuvier, which is a very numerous and extensive genus, and one which I have not yet had time and leisure to name.

3005. Are all the reptiles arranged in classes, orders and species?—Every one, both dry and in spirit; and, with the exception of the single genus referred to, they are named according to the most modern nomenclature.

3006. Will you state anything which occurs to you contained in the "Animal Kingdom" of Cuvier, upon the subject of the difficulty of identifying the species of Coluber?—After referring to some European species, he observes, "Les couleuvres presentent peu de variétés de structure interressantes: je n'ai pas cru necessaire d'en rapporter ici le long catalogue; on le trouvera dans les ouvrages de Gmelin, de Daudin, de Shaw, et de Merrem, mais il faut consulter leurs enumerations avec precaution et critique; elles sont pleines de doubles emplois et de transpositions de synonymes." After a list of such, he observes, "Quant au transpositions de synonymes elles sont innombrable." Cuvier Reg. Anim. ii. 85. We have more than 100 species, I believe.

3007. Dr. Grant, in answer 1,502, has stated that some reptiles are designated frequently by the locality, as China, Brazils, and other parts; will you explain to what in your opinion this refers?—I think he refers to the cases which contain the species of the genus coluber, which are all put in groups according to their natural characters; and many of those groups are what more modern writers, such as Wagler and Boiè, have considered as genera. The species of these genera frequently come from the same country; they are groups limited in their geographical range; so that a person unacquainted with the subject, and looking at it superficially, might suppose that they were arranged geographically. But each of those groups of the genus coluber is in fact a genus; and you will find at the end of the generic character, given by both these authors, the common habitat of the species mentioned. I may give the following examples, extracted from "Wagler's Naturliches System," Munchen, 1830, 8vo. Genus 46, *Dasypeltis:* after the character he adds, (Africa); genus 47, *Trochidonotus* (Asia, Europe, America); genus 48, *Spilotes* (America); and so all through the family. The same thing is done in Cuvier: thus, "Règne Animal," ii. p. 82, he says, "*Les hurria* de Daudin, sont des couleuvres des Indes;" and so on.

3008. Are the localities and names of the donors marked upon the snakes, as they are upon the other specimens?—They are on every specimen which has been given to us, or of which we know the exact locality. Those are facts that we mark on them at the moment of receiving them.

3009. So far as you, as an officer of the Museum and a man of science, are entitled to any authority, would you desire the Committee to understand that the following statement, in Dr. Grant's answer 1502: "The saurian and chelonian reptiles, both dried and in spirit, are also for the most part in a confused and nameless state," is or is not borne out by the fact?—It certainly disagrees with all the evidence that I have given, and it is open to the Committee to see the state in which they are.

3010. Mr. *Hawes*.] Are you aware that Mr. South has made the same statement?—He may have made the same statement, but I beg the Committee to understand that I have not touched a single reptile since the evidence was given by these gentlemen. Mr. Bell has stated that they were in a good state of arrangement, and he is the best authority upon that subject in England: he has paid more attention to it than anybody else.

3011. Sir *Robert Inglis*.] Whoever states the contrary, you pledge yourself as a man

Mr. *John E. Gray.*

28 April 1836.

a man of science, and as an officer of the Museum, that the fact is not so; and above all, that you have not made any alterations since the 24th of March?—Certainly: in the first place it is not so; and secondly, I am certain that I have not opened the cases of reptiles since that date, to put in any names or labels.

3012. Mr. *Hawes.*] Mr. South has stated, at page 84, that having had his attention recently called to the state of the collection in the Natural History department, that "the reptiles are put away, one can hardly say arranged, they are so closely packed that it is almost impossible to examine them." How can you reconcile that statement with what you have now said?—I should consider that the officer of the Museum in whose charge they are, is likely to know their state more accurately than any stranger.

3013. Do not you think that a man like Mr. South is able to state whether they are closely packed or not?—They are closely packed; but I have no reason to believe that Mr. South has ever studied reptiles.

3014. But these are questions of fact as to the arrangement?—The simplest answer I can give to that will be to refer to the evidence of Mr. Bell.

3015. Sir *Robert Inglis.*] Is the answer of Mr. Bell's, to which you have referred, the concluding words of answer 331, "I beg to say particularly, that the nomenclature of the reptilia is, generally speaking, admirable"?—My reference was to his evidence generally; I believed him to have stated that they were well arranged. The answer to which I more particularly refer, is answer 369, "With regard to the reptilia, I should say that the spirit preparations are all well named, but the dry preparations are very deficient in that respect." My answer chiefly referred to the spirit preparations; but at the same time I may say that although labels are not attached to the dry preparations, they are almost all named.

3016. Mr. *Hawes.*] Are they labelled?—No.

3017. Then, in the absence of labels and in the absence of a catalogue, how is a person to discover what they are?—They are all (with very few exceptions) catalogued.

3018. Is there any catalogue open to the inspection of the public?—Mr. Bell, who is almost the only person who pays much attention to reptiles, gives that answer; and he has not felt the want of a better arrangement or of a better catalogue.

3019. Was not that because you furnished him with the catalogue?—No, he never asked for it.

3020. Are you of opinion that Mr. South is quite wrong when he states, "the reptiles are put away, one can hardly say arranged"?—I think he had not examined them carefully; they are extremely crowded I own, but that is a matter which we cannot avoid with our present limited space.

3021. Such labels as they have, are they written legibly?—I believe them to be legible.

3022. Can they be read at the distance at which they are placed?—Perhaps not all; but for those which are placed out of reach we have always ladders at hand if wanted; and I believe our cases are not so high as those at Leyden or Paris.

3023. You have referred to Mr. Bell's evidence as a justification of the nomenclature and arrangement that you have adopted; Mr. Bell has stated, in answer 341, "I should not have found considerable fault with it except that, as I before observed, I think in the dry specimens it is sadly deficient." How do you reconcile that with your statement, that Mr. Bell supports your nomenclature?—I quote again from the copy of the evidence just placed in my hands, answer 331, "I beg to say particularly, that the nomenclature of the reptilia is, generally speaking, admirable;" and 369, "I beg to say that the spirit preparations are all well named."

3024. Does not he say that the system adopted is one which you yourself have introduced?—Yes; which was published in the "Annals of Philosophy," and in the Appendix to "Griffith's Animal Kingdom." Some of my genera were adopted by Baron Cuvier, in the second edition of his "Règne Animal," and by most subsequent erpetologists.

3025. Is it published in any work?—It is published in the "Synopsis of the Museum," in "Griffith's Translation of the Animal Kingdom," and in the papers before referred to: and Cuvier has adopted many of the genera in his second edition. I have, both before and since that time, printed several papers in the various Philosophical Journals upon new genera and new species contained in our collection; and

those genera have been taken notice of, and adopted by Wagler, Boié, and other Continental authors, as well as by Mr. Bell in this country.

3026. In fact, the nomenclature of the specimens in spirit is generally completed, but the dried specimens both of the saurian reptiles and the tortoises are scarcely named?—Almost all the dry saurians are named; the species are determined, and they are only waiting for labels to be written for them; most, if not all, the tortoises are named, and many labelled.

3027. Has that been done lately?—No, I believe that not a label has been put on them (except on the new acquisitions) for more than a year; because the labelling which I did, when the second edition of my catalogue was begun printing, was done more than two years ago.

3028. This question is asked upon the authority of Mr. Bell himself, who, in answer to question 334, states "that very little has yet been done in naming the dry specimens, both of the saurian reptiles and of the tortoises." Do you mean to maintain your statement?—My statement went this length; that many of the tortoises are labelled, and have either numbers on them referring to the catalogue, or the names are written on the specimens themselves; but the tortoises are certainly very much crowded together, and the labels and names are not readily seen.

3029. Is it the fact that very little is yet done in naming the dry preparations of the tortoises?—To a person merely going through the room it may appear so, but it is not so in reality. I produced, on my last examination, the proof sheets of a catalogue in which all the specimens are described, and a reference made to the species in the Museum. They were described five years ago in my "Synopsis Reptilium," so that they were named even then.

3030. Sir *Robert Inglis.*] With respect to the collection of *fish* in the British Museum; can you state what is the number?—We have nearly a thousand species.

3031. What is the number in Paris?—In the Paris Museum in 1823, they are stated to have had 2,200 species; now they are said to have 4,700; but when I was in Paris in 1834, nothing like that number were exhibited.

3032. Are there any rare species in the British Museum?—Cuvier when in London took descriptions of many; and afterwards sent M. Valenciennes to describe a number of the specimens in our collection, of several of which he has given figures in his work. Since that period we have received a very considerable number of specimens, from China especially, of fresh-water fishes, which I believe to be almost all of them new, and not to be found in any other collection.

3033. Can you state the comparative value of the collection of Berlin?—The collection of Berlin is not very rich in species; it only contained in 1818, 740 species.

3034. Looking at the number, and looking at the condition of all the objects, do you consider the collection at Berlin superior to that in the British Museum?—Certainly not, as far as my recollection serves. The collection at Berlin is an extremely valuable collection, as containing the original specimens described by Bloch, but it is not so numerous as that in the Museum. As type specimens, that part of its collection is, however, extremely valuable.

3035. You do not consider the collection in the British Museum as decidedly inferior to the collection at Berlin?—I was not at all struck with the appearance of the collection at Berlin when I saw it three years ago; it was very nicely arranged and named, but not superior to our collection in the number or rarity of the species.

3036. Do you remember M. Cuvier's visit to the British Museum?—Perfectly.

3037. What was the object of it?—One of his objects was to examine the fishes in our collection.

3038. His professed and more special object was a desire of perfecting the work which he was then preparing, and which he did not live to complete, upon the subject of ichthyology?—Yes.

3039. Did he find here any specimens or species which were not in the Paris collection?—Several, of which he had drawings made.

3040. Did he ever apply to the Trustees to be allowed the loan of some of those?—Not to my knowledge.

3041. Is it consistent with the rules of the Museum, or would you regard it as expedient that specimens should be sent out of its walls to a foreign country?—By no means, nor taken out of the walls in any way whatever. I think it is a wise and good rule that no specimen should be allowed to go out of the Museum.

Mr. *John E. Gray.*

28 April 1836.

3042. Are the fish arranged in families and genera?—They are all arranged in large families; and the collections of dried fish are arranged in genera with the generic name placed beside the specimens.

3043. How far are they named?—Not very far; there are some which were named originally, and some which I have had occasion to work out. There are also others which we have received from friends, which have had names with them, and those names are attached to the fish.

3044. Mr. *Hawes.*] You have referred to the authority of Mr. Bell as approving of the classification and nomenclature of the reptilia; are you aware what he stated with respect to the crustacea, in answer 346?—I do not recollect it.

3045. He has stated, "The crustacea in the Museum are arranged in three separate parts." He goes on to state, "The collection which is exposed to view contains a great number of very valuable specimens, which are either not named at all, or named only by a nomenclature which is now obsolete; and in the few instances in which the modern generic terms are placed in the cases, they are thrown in in an irregular manner;" is that the fact?—The crustacea in cabinets are under Mr. Samouelle's charge, but those exposed to view in the table-cases were arranged by myself. When we opened the new rooms, I begged from various persons, and from General Hardwicke amongst the rest, the duplicates of their collections to place in a table, and they were arranged according to the system of Latreille, which is the last complete system published; the old names of the species are employed, as quoted by Latreille in the "Animal Kingdom." Mr. Bell would probably prefer to see the crustacea named according to the work of Mr. Milne Edwards, whose system he has himself adopted, but that work is not yet completed. It only contains a certain portion of the genera; and no part of it was published when I arranged those tables.

3046. Mr. Bell says that the collection contains many species which are either not named, or named by a nomenclature that is obsolete?—He probably considers the nomenclature obsolete with reference to that of Mr. Milne Edwards. I have not counted the number that are not named. The object of those tables was to give the general visitor an idea of the general arrangement of the crustacea, which were placed in such a manner as to render it intelligible. The scientific collection is in cabinets, with the insects.

3047. Another witness, in answer 5, has also stated that scientific names are wanting in many instances; and he mentioned the case of bats and common lobster, and also a great number of the birds; are you disposed to impugn that statement?—No; nor do I impugn Mr. Bell's statement with regard to the other point.

3048. Then that is generally correct?—It is correct as far as labelling is concerned. The lobster may not be labelled; it is an enormous specimen sent to us by Mr. Yarrell, which is hung up over the mantlepiece on account of its large size.

3049. But is it numbered if not labelled?—No, I do not say that the lobster is. The crustacea form part of the *annulosa*; and the general collection is in Mr. Samouelle's department; but I am answerable for these cases, and Mr. Samouelle is not at all to blame for any deficiency in them. The only excuse I will offer for it is, that the entire zoological collection has been open only four years; and I believe that not a moment of the time that I have had at the Museum for naming and labelling the specimens has been lost. As regards the making of catalogues, I constantly take them home to my own house to obtain additional time for working on them.

3050. Your attention is requested to another answer of Mr. South's, to question 741; he states, "I do object to new-formed vulgar names; but not to the common names by which animals are generally known, as I have already stated," thereby implying that there are new-formed vulgar names in the British Museum; is that so or not?—I believe there are none. I know to what Mr. South refers; he refers to the fact, that among the shells certain English names have been given. The names which are there used as the English names of the genera, were those used by Humphreys in the "Calonne Catalogue," which is not a mere sale catalogue, but is one of the most extraordinary and curious works in the history of the progress of conchological science. In publishing his work, many years before Lamarck, this scientific dealer indicated many of the genera since published by that author, and gave to each genus a Latin and an English name: those English

English names are used by the more common dealers; and if I wanted to buy a shell of one of them, I should not ask for it as an *oliva*, but as an olive or a butter firkin; and he would know what I meant by a melon, a helmet, or a mulberry, better than by the scientific names. It is therefore with the view of making the collection useful to people in general, that I have added those names to the scientific ones. Mr. *John E. Gray.* 28 April 1836.

3051. Sir *Robert Inglis.*] But the scientific name is also attached?—Yes, always; similar French names are applied to the genera in the Paris Museum; thus there are the names of arrosoir (*aspergillum*), corbeille (*corbis*), marteau (*malleus*), peigne (*pecten*), houlette (*pedum*); and indeed many of the shells in the collection at Paris are only marked with the French names.

3052. Can you state whether there be anything in the use of the word "porcelain," particularly interesting to the etymological student?—It is curious that those shells are called pigs on the coast of England, and on the coast of Scotland; and they were also called *porcello* in Italy. Thence comes the word "porcelaine," which is applied in France to the common cowrie; and which has been applied (from its resemblance to the polished surface of the cowrie) to the common china. The name sounding peculiar, when I published a monograph of the cowries, I gave this explanation as a foot-note.

3053. Mr. *Hawes.*] What portion of the crustacea is immediately under the care of Mr. Samouelle?—The general collection of crustacea; as a part of the annulosa, they form part of the entomological collection; they were called insects by Linnæus.

3054. Mr. Bell has stated, in answer 404, that he was not aware under whose care that portion is placed which is exposed to the public?—I arranged it, and I am answerable for it; I do not think Mr. Samouelle has ever touched it.

3055. Is not it remarkable that Mr. Bell, who has been so frequently at the Museum, did not know that there was a catalogue of the reptilia till he was examined here?—He never had occasion for it. As for the catalogue of reptilia, there existed a catalogue of almost all the saurian reptiles in the Museum, as long back as the year 1825.

Martis, 3° die Maii, 1836.

MEMBERS PRESENT.

Mr. T. G. B. Estcourt.	Mr. Compton.
Sir Robert Inglis.	Mr. Ridley Colborne.
Mr. Hawes.	Sir Philip Egerton.
Mr. Thornely.	Mr. B. Baring.

MR. T. G. B. ESTCOURT, IN THE CHAIR.

Mr. *John Edward Gray,* called in; and further Examined.

3056. Sir *Robert Inglis.*] TO continue your examination on the relative strength of the British Museum, and of different Continental collections in the department of Natural History; will you state to the Committee what is the number of *shells* in the British Museum, as compared with the collection in Paris, the collection in Leyden, and that in Berlin?—We have in the general collection of shells in the British Museum, 4,025 species, and more than 15,000 individuals; they occupy 44 table-cases. In my evidence of last year, in answer to the question 3336, I gave the number of the species in our collection, comparing them with such documents as I had then been able to collect with reference to the collections of Paris, Berlin and Leyden. Soon after that evidence was given, I found that I had been mistaken in the numbers of the Paris collection, which I took from a note made in haste from a copy of the report to the Minister, lent to me for a very short time. In that report the entire number of the collection was not given, as in most of the other departments, but the amount of new acquisitions was stated in nearly the same form. As soon as I discovered the error, which was the day after Mr. *John E. Gray.* 3 May 1836.

Mr. *John E. Gray.*

3 May 1836.

after I received the printed copy of the evidence, I mentioned it to the Chairman of the Committee; I now beg leave to correct that answer, as far as regards the museum of the Jardin des Plantes, by the following statement: in the Paris collection (according to an estimate furnished to me by a friend who has sent me a detailed account of the number of species in each genus), there are about 4,000 species; but he says, that, as "In almost every genus of shells there are several species without tickets, an imperfect idea would be formed by neglecting these; on the other hand, there are many instances where it is difficult to distinguish between varieties and species, which causes some uncertainty as to the actual number of the latter; the list must therefore be considered as an approximation to the truth."

3057. Is there any error in the answer 3336, with respect to the Berlin collection, with reference to Professor Lichtenstein?—I believe not.

3058. Is there any error in that answer with respect to the collection at Leyden? Not that I am aware of, as I still have the details of the enumeration; but from information lately received from Dr. De Haan, the conservator of the collection, I learn that there are now in the Leyden Museum 3,700 species, arising probably from the accession of Japanese and other specimens since the period of my visit.

3059. What is the number of shells described in the works of authority upon conchology?—In Lamarck's history and "Fenessae Prodomus," there are about 4,200 species described.

3060. Mr. *Hawes.*] Can you state how many species of recent shells there are?—I am not prepared to distinguish the number of recent shells; Lamarck classed the recent and the fossil together.

3061. Sir *Robert Inglis*]. Can you state to the Committee anything with respect to the naming and arranging the fossil shells in the museum at Paris, in the Jardin des Plantes? The fossil shells are now separated from the recent shells, and are not exhibited at present, nor have they been for some little time. The recent shells, as the letter to which I have referred informs me, are in many instances unnamed. My friend says, "considerable confusion is found in the names, as the old ones are allowed to remain, with the new names added in pencil."

3062. What is the nomenclature adopted in the British Museum?—We arrange our shells nearly according to the genera of Lamarck, adding in those genera which were not known to him, or have been discovered since his time; and we use the oldest name. If a shell is described by Linneaus it has the Linnean name; and if first described by a more modern author, it has the name given by that author, by which means the collection is rendered useful to those who employ either the Linnean or the Lamarckian nomenclature.

3063. With respect to the collection of shells in the Museum, have you ever heard Mr. Cummins complain that justice was not done to that collection?—Never. Shortly after his return to England, he said to me that he thought it would be well for the Museum to possess a series of the shells which he had brought home; but he never to my knowledge offered any shells to the Trustees for sale. I do not think that he could have had any feeling of the kind alluded to, because when he left England a few months ago, he gave the Museum a collection of dresses, weapons and ornaments, from the South Sea Islands; and also gave it a contingent interest in his shells.

3064. From which you infer that, generally speaking, he was not displeased with the management of the institution?—Yes. I never heard him in any way complain or make any remarks of the kind referred to.

3065. What is the best work on British shells?—Montagu's.

3066. Is that on the Linnean system?—It is. Montagu and Turton are the authors of the two best works, and they are both upon the Linnean system.

3067. Is there any work on British shells with a modern nomenclature?—There are two such works, one by Dr. Fleming, and the other by Capt. T. Brown, but neither of them is strictly on the Lamarckian method, and neither of them has been received, as far as I am aware, by other naturalists; Dr. Fleming's is the best of the two; but I would not recommend its adoption.

3068. Then, in reference to the nomenclature of British shells, would you as a conchologist consider that the Linnean names are old and abolished?—Certainly not, with reference to English collectors generally. If you were to use any other nomenclature, you would in a great degree prevent them from making use of the collection.

3069. Mr. *Hawes.*] Then your opinion is that the Linnean nomenclature should be

257

Mr. *John E. Gray.*

3 May 1836.

be strictly adhered to, in a modern collection of British shells?—Not in the arrangement of the genera, but in the naming of the species it must be regarded as the basis.

3070. And in a scientific point of view you think it the latest and best system that can be adopted for naming a collection of British shells?—No other, as far as I know, has been applied to the British shells, except Dr. Fleming's and Capt. Brown's; but I have never seen either of these used in any collection.

3071. You have been asked a question with regard to the abolition of the Linnean nomenclature; are you aware whether any witness has recommended the abolition of the Linnæan nomenclature?—I do not recollect any witness having recommended it. The Linnæan names are those which the British conchologist would best understand at the present time.

3072. Is the Committee to infer that the British collection is named according to the latest and most approved system?—The British collection is arranged according to the most improved system; and the names given to the shells are those by which they were first scientifically described.

3073. Are the Committee to understand that the nomenclature adopted in the British Museum is the latest and best that could be adopted?—Generally, I believe it is.

3074. Sir *Robert Inglis.*] Do you make a distinction between the latest and the best?—No, I mean the best in every sense.

3075. Sir *Philip Egerton.*] Does it necessarily follow that the latest is the best?—By no means; the work of Capt. Brown, for example, is the latest arrangement of the British shells, and in it you will find many such words as *lutea* employed for generic names, which is against all the received canons of nomenclature; he even places the same shell in three different genera.

3076. Would you consider that the description given in answer 1508, "The shells of the most common British species of muscles and oysters, clams and cockles, whelks and snails, which may be carted up from our fields or our ponds, or our coasts, are widely spread by fifties and by hundreds of duplicates in our fine glazed cases," an accurate description of the state of the conchological division of the Natural History department of the British Museum?—I do not think it is. I suppose the witness refers to the British shells; our plan is to give wherever it is possible, a series in the various stages of growth from the youngest to the oldest, because conchologists have often considered a young shell as a different species from an old one, for want of comparing the gradations between them. Various alterations are also produced by their being found in dry or wet situations, or in rough or smooth water, and for that reason we must frequently enlarge our series. But our series is not generally large; it seldom exceeds 20 or 30 specimens; sometimes we have not more than two or three, and it is not always the most common shells of which we have the largest number. I may add, that it is in consequence of the comparisons deduced from those series, that the nomenclature of shells, and that of British shells in particular, is becoming much more fixed than it was when it was the custom to keep only two or three specimens of each; such a series forming the best illustration of the laws which regulate variations of size, from consistency and colour.

3077. Mr. *Hawes.*] Then it is not the fact that duplicates of the most inferior specimens are so common as stated by Dr. Grant, in answer 1508?—I do not consider any of the specimens in any of our series as duplicates. I believe they are only no more than sufficient to fulfil the intention above referred to, that of showing the various gradations and states of the species to which they belong. There is also another reason why I should not like to turn out any of those specimens, they are the type specimens which Montagu described in his work on British Shells, and which Dr. Leach, who was also engaged on a similar work, has also described; and it is on these specimens that Leach and Montagu worked, and if we had thrown out any of them, we might have destroyed the means of showing the grounds upon which they came to their conclusions.

3078. Dr. Grant has stated that he was anxious to consult the collection of fossil ammonites, of which there are perhaps half a thousand specimens known, and he was informed that there was a fine collection in the Museum, but, upon inquiring of Mr. Gray, he was referred to Mr. König; and upon inquiring of Mr. König, he "was informed that they were packed up in papers and in boxes, and were not accessible, being stored, for want of room, in some store-place in the lower part of the building:" is that the fact?—I know that we have a large collection,

Mr. *John E. Gray.*

3 May 1836.

but I do not know where they now are. I should have thought that there were hardly half or even a quarter of a thousand species of ammonites known; but I know that we have a large number, and that they were in a table-case in one of the lower rooms. Whether they are packed up I cannot say, not having seen them for a long time, as they are in Mr. König's immediate care.

3079. Sir *Robert Inglis.*] Are they in that state from the general transition state of the Museum, or are they so from any disregard to their scientific value?—I have always understood that they were to be exhibited as soon as possible; and I believe that arrangements will shortly be made for their being shown.

3080. Do you or do you not believe that their present position is owing to the want of room?—Quite so. A few years ago I looked through them with Mr. König, to determine their species, with a view to prepare them for being exhibited, and I know therefore that it is intended to exhibit them.

3081. And you believe that that intention will be carried into effect so soon as adequate space is provided for the arrangement and exhibition of them?—Undoubtedly; but there is another part of the answer referred to about which I should doubt. With respect to fossil ammonites, (even if there be the enormous number of species which is there stated), I know not how they can be regarded as superior in interest to shells, of which we have so many collectors in this country; while of fossil ammonites we have very few.

3082. And you think that the collections of British shells are as valuable to the naturalist in this country as any other division of natural history?—I have no doubt that there are ten times as many students of British shells as there are of fossil ammonites. We cannot put fossil ammonites in the room appropriated to British zoology; the mixture of subjects, of which the witness referred to complains in other parts of his evidence, would then indeed be glaringly absurd.

3083. Mr. *Hawes.*] Is it or is it not the fact, that there is an abundance of the most common British specimens of shells, for instance, of muscles and oysters, clams and cockles, whelks and snails, and that there is no single fossil cephalopod, or fossil bivalve, or fossil coral exhibited in the collection?—It is not the fact; there are several fossil cephalopods exhibited in the series of exotic shells. Where we have not (or that is not known), a recent species, we sometimes put a fossil species as the type of the genus; but the general collection of fossil chambered and bivalve shells is not exhibited, because we have not room at the present moment for their exhibition.

3084. If you have found room to exhibit the inferior specimens, why were not the more rare specimens exhibited?—I disagree altogether with the statement that the British shells are inferior to the fossil ammonites, either in scientific value or public interest; many of them are much more rare and difficult of acquisition, and the collection which we possess of them is very nearly complete.

3085. Do you include the species which have been mentioned among the more rare shells?—I would especially refer to our series of each of the numerous species of British snails (*helix*), and of welks (*priccinum*), some of the individuals of the latter are very curious and rare; one of them was sold at a public sale, a short time before we purchased it, for 20 *l.* Our series of the various species of cockles (*cardium*) of *pinnæ*, and of pond muscles (*anodon* and *unio*), are highly valuable, as showing that what have been considered as species are in fact only varieties occasioned by local circumstances.

3086. Sir *Robert Inglis.*] Do you wish the Committee to understand that the fossil shells which may not be exhibited to the ordinary visitor, in consequence of there being no adequate place for such exhibition, are concealed from the eye of the scientific visitor, if he specially desire to consult them, even in the present transition state of the Museum?—I have no doubt that Mr. König would show them, or direct me to show them, to any scientific visitor who desired to consult them for a specific object. I have not the charge of the fossil remains, and therefore cannot speak to all the particulars connected with them.

3087. *Chairman.*] Is it, according to your apprehension, the fact, that those common shells that have been adverted to are spread by fifties and hundreds of duplicates in the Museum?—I have before said that I do not believe there are any duplicates; there may be many specimens of the same species, but they differ in size, or in some peculiarity of growth, form or colour, and cannot therefore be regarded as duplicates. If it be said that wherever there are four or five specimens of the same species of shell in the collection (no matter how greatly they may differ in size or colour), all but one must be regarded as duplicates, then indeed we have

have many duplicates; but if the object is to give a history of the species, they are not duplicates, but necessary for the elucidation of the subject.

3088. Are they spread by fifties and hundreds?—I believe not. I do not recollect an instance of a series of a hundred specimens, and scarcely one of fifty; if there is, it must be of a small or very variable sepcies.

3089. Is it, according to your apprehension, correct that there is no single fossil cephalopod exhibited?—There are certainly several; I can refer at the moment to some genera, such as *scaphites, furrilites, hamites, belemnites*; and there are also two or three species of *ammonites*, placed in the recent collection to illustrate the forms which are wanting to complete the series.

3090. Are there any fossil bivalves?—I believe none of the fossil bivalves are at present exhibited.

3091. Is there any fossil coral exhibited?—There are a few so placed among the recent corals, in the same way as among the shells, to illustrate genera of which we have no recent specimens. The collection of fossil corals is not at present exhibited, because there is no room for its exhibition.

3092. Mr. *Hawes.*] Whereabouts are the fossil cephalopods?—Those to which I have referred are placed in the general collection of shells, together with the recent cephalopods, in the case No. 2, near the door of the mineralogical gallery.

3093. Sir *Robert Inglis.*] Were they so exhibited on the 24th March 1836, the date on which the answer recently quoted was given by Dr. Grant?—They were so exhibited in the year 1832, and have been so ever since.

3094. *Chairman.*] It is a fact that there is not room for the exhibition of the different curious fossils to which reference has been made?—The general collection of fossil ammonites and fossil corals is not exhibited for want of space; that I believe to be the reason.

3095. Mr. *Hawes.*] Is it or is it not a fact, as the Committee have been informed in answer to question 1501, that the same species of shells in the two adjoining rooms are designated by totally different names?—I do not know to what particular shells the witness referred; but I think it is hardly probable that such is the case. The generic names are the names of Lamarck, and the names of the species are the names by which they were first described: there is no confusion at all. I believe that where the same species occur in both collections it is placed under the same generic name, and has the same specific name attached to it But we have very seldom indeed specimens of the same shell in both collections.

3096. Sir *Robert Inglis.*] Are you prepared to state to the Committee the number of *insects* in the British Museum as compared with the number in the collection of the Jardin des Plantes, the collection at Leyden, and the collection at Berlin?—As to the collection in the British Museum, I have stated before that the insects are only under my charge during Mr. Samouelle's absence; I do not know their precise number. In the Leyden collection there are 25,400 species, viz. 14,000 coleoptera; 800 orthoptera; 400 neuroptera; 2,200 hymenoptera; 1,400 hemiptera; 5,000 lepidoptera, and 1,600 deptera. In Paris, according to Deluze, they had in 1823, 25,000 species of annulosa, of which 20,000 were insects, and 600 crustacea; of cirrhipedes, 70 species have been described; we have 108, and they have in Leyden 82.

3097. What is the latest and best authority upon the subject of insects as to the number of species?—Dr. Burmeister of Berlin, thinks there are 80,000 species; he gives his reasons for it as follows:—The Berlin collection has 28,000 coleoptera, and the coleoptera in collections stand in proportion to all the other insects in the ratio of 2 to 3; this makes 70,000, and he allows 10,000 more to make up the number. Count De Jean's collection at Paris has 21,000 coleoptera.

3098. In answer 1523, Dr. Grant has stated that there is "not a single specimen of a myriapod exhibited with the insects and crustacea in the cases of the British Museum; not a single specimen of the class arachnida." Will you explain to the Committee what is the state of the case according to your view of it?—There are some exhibited in the wall-cases; but those which formed part of the same exhibition with the insects and the crustacea in the table-cases, were not exhibited at that precise time; they had been exhibited but a month or two before, and were then in Mr. Children's room for the purpose of naming the specimens. I believe they will be replaced as soon as completed.

3099. How long was it before the 24th of March that they had been exhibited?—I cannot exactly state; but very shortly.

3100. Had they been exhibited for a considerable time?—Yes.

Mr. *John E. Gray*

3 May 1836.

3101. For how long?—Two or three years.

3102. Are the Committee to understand that they were removed to another room for the single purpose of being more conveniently named?—Yes, I believe so. When I collected together and arranged the crustacea, I put out the arachnida and myriapoda also. There are also other specimens, as I before observed, in spirit at the end of the cases which are now exhibited; and we have in the Museum a very fine collection of myriapoda formed by Dr. Leach, many of which were described by him in his "Zoological Miscellany." Dr. Leach's arrangement of these animals is the one now adopted on the Continent, and they form one of the most perfect departments of annulose animals in the collection.

3103. Mr. *Hawes.*] How long have they been in the room of Mr. Children in order to be named?—I do not know how long; they were taken out when he was arranging the arachnida.

3104. You do not know how long?—It may be about three or four months; but I do not exactly know.

3105. Are you aware that in the evidence of last year it was stated that Mr. Children was naming the arachnida?—Yes; and I think it was shortly afterwards that those specimens were taken away to be named with the rest. I beg to add, as a proof that they were exhibited until very lately, that they are mentioned in page 31 of the 29th edition of the "Synopsis," where it is said that the table-cases 9 and 10, before the windows, contain an arrangement of spiders (arachnida), so that they were exhibited in 1835.

3106. Mr. *Hawes*] Will you point out the passage in the Synopsis in which they are stated to be exhibited?—Yes; it is in page 31, and runs thus: "Cases 9 and 10, before the windows, contain an arrangement of spiders (*arachnida*). The *myriapoda* were at the end of the spiders."

3107. May not portions which are stated to be exhibited be removed from the general collection after the catalogue is printed?—In such a case they would be left out in the next edition of the Synopsis.

3108. But, pending the sale of the edition, may they not be altered while the Synopsis remains the same?—Yes; but the edition referred to was printed last year, and we endeavour to avoid making alterations of the kind till the Synopsis is about to be reprinted.

3109. May there not be alterations made in the collection pending the sale of an edition of the Synopsis?—Certainly there may be.

3110. Sir *Robert Inglis.*] Does not the Synopsis prove that at some period these particular species were exhibited?—Yes, it proves that they were exhibited in the year 1835, as they had been for a year or two before.

3111. Mr. *Hawes.*] But it does not prove that they were exhibited during the whole of the sale of that edition of the Synopsis?—No; it proves that they were exhibited last year when the edition was printed.

3112. Sir *Robert Inglis.*] What is the fact, so far as your judgment and observation may enable you to give an opinion, with respect to the exhibition in Paris of the wax models, which it is stated are there exhibited, of certain insects; the question refers to the latter part of the same answer 1523, of the same witness Dr. Grant?—There are some skins of the larvæ of insects filled with wax, exhibited in the Paris Museum, but they are very much bleached and destroyed. I believe we have some similar specimens here, but they are preserved in the cabinets; they are scarcely fit for exhibition, because they became so soon bleached; it is difficult to preserve their colours even when they are kept in the dark.

3113. From your own personal knowledge, are you able to state to the Committee anything with respect to the condition of the insects left by Sir Hans Sloane?—My knowledge of the details of the collection is very limited, the insects not being under my charge except for about a month each year. There are one or two insects in the cabinets which certainly belonged to Sir Hans Sloane's collection, being figured in "Pettiver's Gasophylarium," and there are also a number of square glass-cases containing insects, and two folio volumes, in which are preserved a great many lepidopterous insects placed between sheets of talc, all of which belonged to Sir Hans Sloane's collection. I began zoology by studying insects, and assisted Dr. Leach in arranging some of the insects in the British Museum cabinet.

3114. Can you give to the Committee any comparative view of the value of the collection of *zoophytes* in the British Museum, as compared with a corresponding collection in any foreign museum?—We have in the British

Museum

Museum 747 species and 2,200 individuals; in the Leyden they have about 700 species, 200 of them being of radiated animals and 500 of corals. The specimens of coral in that collection are kept in wall-cases, each coral being supported on a black turned pedestal, and they occupy 120 feet of upright cases. When I was in Paris, there were very few specimens of this class exhibited; they had just purchased Lamarck's private collection from Prince Massena, which was placed in one of the private rooms over the herbaria. These are now about to be exhibited, but I have not seen them. My friend, in his letter before referred to, observed, "the state of the corals is such that it is almost impossible to say the number; few have names, and those named by Lamarck have had them removed." Further, he observes, "the corals and radiata cannot be considered as arranged, for though a great number of specimens are exhibited, they are not placed together even in the same room. The stony corals are in upright cases; the fossil species are with the recent." The Berlin collection, at the time of my visit, was small; but Ehrenberg, who has published a paper on the arrangement of corals, describes 506 species, for many of which he refers to the Berlin collection, to which he has probably added many specimens brought by himself from the Red Sea. M. De Blanville in his book, "Manuel d'Actinologie," which is the last complete work published on radiated animals, gives a list of the known species, amounting in the whole to 979; in several instances, however, the same species occurs twice over in this enumeration.

3115. Dr. Grant has stated, in answer 1514, that "there is not a single species or specimen of any extinct zoophyte yet exhibited, nor even of the most common echinida, in the fossil department of the British Museum." Will you state what is the fact?—There are a few fossil corals placed along with the other corals to illustrate such genera as are found in a fossil state; but the general collection of fossil corals is not exhibited. Before the collections were removed into the new building we had a beautiful and arranged collection of fossil corals, which collection still exists, and only requires space to be again exhibited. I believe, however, that they are arranged so as to be still accessible for scientific purposes.

3116. Are they all named and labelled?—When they were formerly exhibited, they were all named by Mr. König, and a great number of the species were new. I believe he has figured some of them in his "Icones Sectiles."

3117. How are the fossil remains arranged in the Paris Museum; [the question refers to the statement made, in answer 1509, by Dr. Grant:]—Will you state to the Committee, so far as your own observation enables you to state, your view of the case?—The fossil bones in Paris are arranged in a room by themselves; the fossil shells and corals were arranged along with the recent species; but the shells are now mostly, if not all, removed. I think the fossil bones are in the second room on the first floor.

3118. Mr. *Hawes.*] Does it not form one of the most celebrated collections of fossil osteology in Europe?—It may be the most celebrated, as regards the fossil bones of quadrupeds, because Cuvier got together as many fossil specimens as he could as materials for his great work; when he could not get bones he got casts, and a great many of the figures in his work are taken from other engravings or drawings of specimens in other museums; some are from objects in our collection.

3119. Is there any collection that can be compared with it?—I have not the means of making a comparison between the relative numbers of this and other collections. I certainly have seen as fine, or almost as fine a collection at Darmstadt, and perhaps also at Stutgard, where they have large specimens; but certainly taking together the bones and the casts, that of the Paris Museum is a very magnificent collection. You cannot judge, however, from Cuvier's great work of the extent of the collection, because he got many drawings from other countries; and a great part of the value of that book depends on the figures of recent bones and skeletons as well as fossils. I may add that they have a formatore attached to the collection to make casts of the fossil bones, which are distributed to provincial and foreign museums; some of these were sent by Cuvier to the Zoological Society here. We have also occasionally employed a formatore for the same purpose.

3120. Sir *Robert Inglis.*] What observation have you to make on the subject of the collection of fossil crustacea in the British collection, with reference to answer 1512?—We have a considerable collection of fossil crustacea which are exhibited. The "plaster" there referred to, instead of being casts of "such as abound in our strata," are almost all from unique American specimens, and were sent to us by the person who described them, from Philadelphia.

Mr. *John E. Gray.*

3 May 1836.

3121. Mr. *Hawes.*] In the question and answer to which you have referred, it is stated that "In room No. 9, case 8, containing the crustacea below the deacapods, there are 73 specimens, and of these one only is named;" is that the fact or not?—That refers to the table of recent crustacea, which are only arranged in genera according to Latereille's system, with a view of exhibiting the principal forms of the class, as explained in my former examination.

3122. You have gone carefully over the evidence of Dr. Grant?—I have read it, and some of the other evidence at home in the evening, and made a few notes on it as I proceeded.

3123. You have not ascertained whether those facts are so or not?—I did not look at the numbers, for I was not at the Museum when I read the statement. We have been naming the entire collection as rapidly as circumstances would permit; but I have not yet taken up the crustacea with the view of naming the species. I have worked more on the reptiles, shells, corals, &c.; because we had already a well named collection of crustacea in cabinets, which was accessible to all students who might be desirous of consulting it.

3124. Sir *Robert Inglis.*] Does the collection of extinct quadrupeds consist, as mentioned by Dr. Grant in answer 1513, solely of plaster-work?—We have many beautiful, rare, and even unique fossil bones of mammalia.

3125. In answer 1513, Dr. Grant says, "there is an exhibition consisting solely of plaster-work, representing parts for example of the deinotherium," and so forth, "but not a real fragment is seen of any one of these quadrupeds." Is that the fact, that the collection to which the answer refers consists solely of plaster-work?—There is no exhibition consisting solely of "plaster-work."

3126. Mr. *Hawes.*] Is there not an exhibition consisting solely of plaster-work?—No; there are casts, beautifully made, of a series of fossils contained in the museum at Darmstadt, and unique in that museum. There are also a few casts of bones from the Paris Museum, sent I believe by that institution.

3127. Sir *Robert Inglis.*] Is that exhibition in a case, consisting solely of plaster casts without any exhibition of real bones?—Certainly not. They are placed along with the fossil bones of other quadrupeds.

3128. Have you ever seen the originals, of which the plaster casts are exhibited in the case, to which the last question referred?—Yes, I saw them at Darmstadt the year before last.

3129. Will you state your opinion of the accuracy with which those casts represent the originals?—They are most beautifully made. The specimens from which they are made are unique in the collection of Darmstadt. I have seen other copies of the same casts in various foreign museums.

3130. Are there any other casts from the same bones in England?—I am inclined to think not; I have never seen any in England.

3131. Mr. *Hawes.*] Is it the fact, as Dr. Grant states in the answer to which you have been referred, that "More than half of the fragments even of the mastodons, that is 44 out of 74 fragments, are also of the same painted plaster; and although our diluvial cases abound with remains of extinct bears and hyænas, not a fragment is yet to be found in that collection of the remains of those quadrupeds?—It may be so; I have not counted the number. That there are no fossil bones of bears or other carnivorous animals exhibited arises from the circumstance that the fossil collection of that order has not yet been arranged for exhibition. The fossil bones of mammalia exhibited, are labelled "osseous remains of pachydermatous and of edentati animals."

3132. Then you have specimens of bears and hyænas, which are not exhibited?—Certainly. I recollect specimens of them when the collection was otherwise arranged. There were specimens of the bones of bears and other carnivorous quadrupeds exhibited, brought from Kirkdale and other caves.

3133. Where are they now?—I believe Mr. König has them in store.

3134. Sir *Robert Inglis.*] Can you state to the Committee at what period zoological lectures are given in the Jardin des Plantes at Paris, and how far such lectures are coincident in time with the exhibition there?—The only zoological lectures that I have attended there were given when the museum was closed. They were given in the room which contains some of the specimens of fishes.

3135. When you say that, do you wish the Committee to understand that zoological lectures are given at any other time?—I believe not.

3136. Can you state that lectures are not given at any other time?—I believe they

they are not; as far as I am aware they are given when the museum is closed, for they were given in one of the museum rooms, formerly used as the library.

3137. What is your opinion of the expediency or inexpediency of lectures on zoology being delivered in any national institution, supported at the expense of Government?—I do not think it advisable; I gave my reasons for this opinion in my examination of last year, and I am more strongly confirmed in it by all that I have since heard.

3138. Is it a fact, that there is at present no opportunity of acquiring oral instruction in any department of zoology in this country?—I believe there are five gentlemen who give lectures in London, on zoology and comparative anatomy; Mr. Bell at Guy's Hospital, Dr. Farre at St. Bartholomew's Hospital, Dr. Roget at the Royal Institution, Dr. Grant at the London University, Mr. Jones at King's College, and in Webb-street School; Mr. Wood, and the two last-named gentlemen, have also lectured in various parts of the country. I do not know what number of pupils these gentlemen may have, but their classes are open to all students, whether medical or not; and I believe the entrance-fee is very small. Speaking from my own personal knowledge of most of them, I am convinced that they are more anxious to get pupils, to whom they may impart information, than to get fees.

3139. From your knowledge of Continental museums, can you state anything with reference to the time of exhibition at the great museums?—The galleries of natural history in the Garden of Plants at Paris, are open to the public at large on Tuesdays and Fridays of each week, from three to six o'clock in the summer, and from three to dark in the winter; students and visitors are admitted every Monday, Wednesday and Saturday, from 11 to 2 o'clock; students must have a card, which is delivered at the office of the administration, to those who have had their names registered at the lecture-room in a book kept for that purpose by the assistant naturalist. This card cannot be used by any other but the person whose name it bears. Casual visitors (and it is in that way that English visitors generally get introduced) are admitted by another ticket, distributed by the professors on application, which serves but once, and admits several persons at the same time. The galleries of botany are open only to botanists, and such as wish to ascertain the identity of a plant, its synonime, &c.

3140. Generally speaking, do you wish the Committee to understand that in your judgment the student or the general visitor in Paris has more or less facilities than the corresponding classes of persons have in the British Museum?—I do not think they have so much in any respect, and they certainly have not the same facilities as regards time, the time is not nearly half so much as they have in our Museum. The museum at Brussels is open like our own, three days in the week (Sundays, Mondays and Thursdays), from 10 to 4. Foreigners are admitted on other days on paying a gratuity to the porter. The Brussels Museum is closed during the months of August and September. All the other museums are open much less. The Leyden Museum is open to such as procure tickets of the administrator, four days in the week, from 12 to 3; but it is open on any day but Sunday by application to the porter, who expects a small fee from all visitors, "as he receives a very small salary." The Dresden Museum is open to the public twice a week, only a certain number of persons are admitted at each time. The Frankfort Museum of Natural History is open to the public two hours a day twice a week; it belongs to a private society, but has an allowance of 1,500 florins, about 120 *l.* a year from the town. The Stutgard collection is open at any time by giving notice beforehand to the inspector, who exacts a small fee for his trouble. The Copenhagen Museum is open twice a week, every Thursday and Sunday, from 11 to 2. The three museums of natural history in Vienna, are each open to the public once a week, from 10 to 1; the mineral gallery on Wednesday, the zoological and botanical one on Thursday, and the Brazilian on Saturday. The museum of Turin is open to the public three hours a day twice a week, and shown at other times to strangers on the payment of a small fee. The zoological and zootomical museum of the academy of Petersburg is not open to the public, but students are allowed to visit it by permission of the director.

3141. Are those institutions, so far as you know, all supported at the expense of the respective governments?—I believe all of them except the one at Frankfort which belongs to a private society, but is partly supported by the town, from which it receives about 120 *l.* a year; it was partly built by private subscription. All the rest are government museums.

3142. Mr. *Hawes.*] With regard to the hours of admission, is it your opinion that

Mr. *John E. Gray.*

3 May 1836.

that the rules and regulations of the museums abroad are necessarily to be taken as a guide for the Museum in our own country?—By no means; we are far more liberal as regards admission, than any museum with the regulations of which I am acquainted, and our collections are much more freely used by the public at large; but I have always considered it desirable that the Museum should, if possible, be even more open than it is, that is to say, for an hour or two later in the summer time. I would give every possible facility to all classes of persons to visit it, and one of my reasons for this extension of time is perhaps different from what is usually stated. I have always observed that the more fashionable people find their way to our Museum just previous to the time of closing it; and I believe that for their accommodation, as well as for the accommodation of those who are employed in active occupations in the middle of the day, it would be well that the Museum should be kept open an hour or two hours later; but I do not think it desirable that it should remain open after six or seven o'clock, as I have frequently noticed that very few persons indeed visit exhibitions (such as that at Somerset-house and the Water-colour Gallery) after those hours, although they are kept open later.

3143. Should you apprehend either inconvenience or injury to the collections by opening the Museum during the public holidays?—Not at all. I have never seen reason to complain of the conduct of the visitors on even the most crowded days. I have always thought that it might be advantageous, and I know of no inconvenience that would arise from it; at least if any were apprehended, we might have a greater number of attendants on those days. I should not, however, like to see the same military police and strict surveillance that is employed in the Paris Museum; but we might readily obtain sufficient protection. I see no objection to it, and should like to see it carried into effect, as it would allow many to see the collections who can see them at no other time.

3144. What is your opinion of the supply of books in the Natural History department of the library?—I have in the course of my duties at the Museum, necessarily had occasion to consult the library very much, and I have not generally felt the want of books; on the contrary, I think we have a good supply, especially of the larger and more expensive ones, which are most wanted in a library of reference.

3145. Have you examined the list called Desiderata in the Zoological Department of the National Library of the Museum?—I only saw it for a few minutes, a day or two ago. I see many titles in it of books which we have in the library, and many others of papers in journals and transactions which I should hardly expect in such a list. I mean titles of papers published in transactions which are not distinct books. The first of the two papers of Baër's is in the Museum. Blainville's Paper on the Ornithorhynchus is a Thesis. Bogros on the Structure of Nerves, and two of Breschet's Papers are in the "Annales des Sciences Naturelle." Cloquet on Serpents is in the Transactions, or rather "Mémoires des Museum."

3146. Is the Transaction published separately, and sold as a separate work or not?—I am not aware that these papers are published separately, but some separate copies may have been distributed by their authors. I have received several separate papers, extracted from transactions or journals from M. De Blainville and others; and I believe the authors of most papers have a few copies taken off for their own especial use, which they send to their friends. Looking down the list I find M. Frederic Cuvier's Observations on the Structure of Feathers, which is also a paper in the "Memoirs of the Museum;" Deshaye's Descriptions of the Fossil Shells of the Environs of Paris, a book which we have in the Museum; Dumenil and Bibron, on the Natural History of Reptiles, which we have also, as well as Milne Edwards's History of Crustacea. But I think I can understand how the two last-named works appear in this list. They are part of a series of works, called the completion of Buffon; and are probably inserted in the catalogue, under the title of "Buffon," which is the real title of the whole series; whereas those employed by Mr. Owen are merely secondary titles of the books.

3147. That would appear to show the necessity of something like a classed catalogue?—I dare say, under "Dumenil" and the other names, you would find cross references to these books. The two works of Ehrenberg here named, are both papers in the Berlin transactions. These two works of De Férussac we have in our library. Fichtel and Molls' book, the next book in the list, we have; also Fischer's Anatomy of Makis, and Fischer's Essay on the Pearl; the latter is I believe in the Petersburgh transactions.

3148. It appears to be published at Moscow?—Yes; I now recollect that it is published

published separate, but we have it in the library. Geoffroy's on the Heads of Animals is in the "Annales des Sciences," and his paper on the Sexual Organs of Ornithorhychus, is in the "Mémoires des Museum." Vander, however, upon the Colours of the Chamelion, we have; and Goldfuss's Petrefactions of Germany; Kiener on the Species of Shells in the Museum of Prince Massena, and Leach's Malacostraca Podopthalma Britanniæ, are all in the Museum. Lyonnet's work is in the Museum, both as a separate book, and in the Memoirs of the Museum, Paris; Memoirs of the Wernerian Natural History Society, we have.

3149. Those errors would scarcely have happened had there been a good classed catalogue of the collection of books?—The papers in journals and transactions would never appear in a classed catalogue of books only; and if you were to form a classed catalogue containing the papers in journals and transactions, you would require an enormous quantity of hands to do it. Thus, for example, M. F. Cuvier's paper on Feather's, which was published in the "Mémoires des Museum," would not appear in a classed catalogue of books, being merely a single article in a journal.

3150. Is it then the fact with respect to many of those instances of papers of transactions, that they have not been published as separate works?—I believe so. Separate copies may have been presented by the authors to their friends. Mr. Owen, most probably has received some of them, and I have received some myself; just as when one of my papers was printed in the Philosophical Transactions, I had some copies of it printed off separately and distributed them among my friends, especially such as live abroad. But Mr. Owen must have made out this list from some catalogues, for here is a work of M. Deshayes, which I do not think is yet published; and he refers to the new edition of Lamarck as being of eight volumes: only four are yet published; these we have in the Museum. In the same way he refers to two volumes of the Zoological Society's transactions, of which only one is published, and that we have. Tyfe's work is in the library, as the fourth volume of his work on General Anatomy, of which it forms part. Continuing to glance over the list, I find Pfeiffershells Temminck's Natural History of Pigeons and Gallinaceous Birds, and Temminck's Monographs of Mammalia, all of which I have myself often used in the Museum library. I should say that for zoological purposes, I have found the library of the Museum exceedingly good; there may be a few books which I have occasionally wanted; but very few.

3151. Is the general character of this list inaccurate?—I should be sorry to say so; I have not looked at it sufficiently to say so. Most of the books in it, which I do not recollect to have seen in our library, appear to be small pamphlets, which it is not easy to procure out of the place where they are published.

3152. Can you state what proportion of these books is not to be found in the Museum, and what proportion is to be found?—I cannot; I have not looked it over for that purpose. I have merely glanced at it for a few minutes a day or two ago, as I was waiting to be examined, when I made these pencil marks on a copy belonging to one of the members of the Committee, then laying on the table. I have no doubt that had I the time to go carefully over the list, I could have shown that a very large proportion of the titles in it are of books already contained in the Museum, or of papers in journals and transactions, which journals and transactions are themselves in our library, while many of the remainder are inaugural lectures, trifling pamphlets, and academical dissertations, sometimes of little value and always difficult to procure.

3153. Have the Trustees taken any means to obtain copies of those transactions?—All the journals and transactions that I have referred to as containing these papers, are in the Museum.

3154. Is there any communication kept up with foreign societies with a view to obtain the latest transactions?—I believe there is, but I do not know how they are obtained. I have myself scarcely ever found any want of zoological books in the Museum library; or if I have wanted any book I have asked Mr. Baber, and he has generally got it for me. At the end of the year he has generally asked me, "are there any zoological books lately published which you would wish me to purchase;" and if I recommend any they are generally purchased.

Charles König, Esq. called in; and Examined.

Charles König, Esq.

3 May 1836.

3155. Sir *Robert Inglis.*] THE Committee understand you are desirous to be examined in reference to certain observations made upon the department under your charge by two of the witnesses who have recently come before the Committee, Mr. Bowerbank and Dr. Grant; will you state as briefly as you can the observations which you desire to submit to the Committee on the subjects treated by those gentlemen in respect to your department?—I certainly wish to make a few remarks upon what has fallen from those two witnesses, chiefly on the subject of the collections of secondary fossils. Of course I can have no reason to endeavour to make the collections under my care appear richer and better than they actually are; but, at the same time, having taken a great deal of pains with them at different times, I should not like by my silence to sanction what I consider not exactly correct. The Committee will be pleased to bear in mind that one thing is, the present state of the collection of fossil remains, and another the state in which it formerly was before the removal took place. In some respects it is at present richer and better; in other respects it is inferior, because the whole is not exhibited. It was exhibited in the old building, in rooms 9 and 10; and subsequently in two rooms on the other side of the saloon, 5 and 6. Circumstances, over which I had no control obliged me to remove the whole twice; and this, the second time, was done in rather a tumultuary manner. I was obliged to remove the whole collection before preparations had been made to receive any portion of it. To come to particulars, I wish to say that the fossil echini, for instance, were, in the rooms of the old building, in a pretty perfect state of arrangement; they were disposed according to genera and species, and the collection was frequently made use of by geologists: it contained many new species described by me, and of which I have memoranda; of these the witness says, in answer 887, "the collection of fossil eschinites I should say was poor." Now I think he should *not* say so, for he has not seen it; indeed no part of them is exhibited; they are all at present shut up in drawers.

3156. Then you wish the Committee to understand that it is not exhibited merely because there was not room, under the existing arrangement of the building, to exhibit it?—I wish to object in toto to the answer given by the witness. In the same manner, after giving an account of his collection, he goes on to say, No. 884, in answer to the question, "Has the Museum any similar collection"? They have; but I have never seen any collection anything like my own. Six or eight months ago I went for the purpose of seeing again whether any of the shells were out, and I found about the same quantity out that I had seen before;" and further on: "at that time tertiary and secondary were together; I am not aware that there are others than what are exhibited." Now the answer to this is, the collection in question is zoologically arranged; but in his "stratagraphical" zeal, and regarding it as "an absurdity to arrange the objects of one science according to the laws of another, without reference in any degree to the first science," he totally disregards the circumstance that the collection cannot be meant for a geological collection. He might have seen on 14 or 15 large labels, the names of Lamarck's class, and orders of gasteropodous mollusca. This is a small collection, but it consists of about 800 species, nine-tenths of which are named and ticketed by myself. In reply to a further question, No. 848, "Have you any reason to suppose that there is any great number of fossil shells in the Museum not exhibited to the public;" the answer is: "I have reason to suppose the contrary, if I recollect right, from the evidence of one of the officers, which states, that there are no shells to any considerable amount which are not exhibited." Now, in point of fact, he does *not* recollect right, for no one has said a word about fossil shells except myself; and what I say is diametrically opposite. He has entirely overlooked the acephalous mollusca, undisturbed by the improbability that there should not be a single half of a bivalve shell in the collection. In answer to question 903, the same witness says, that the "arrangement of the fossil remains has gone forward to so small an extent that it would be very little trouble to arrange them stratagraphically." But he is certainly not aware of the extent of the difficulties which beset an arrangement such as he proposes; the scantiness of our present knowledge of the fossiliferous formations of various countries; the impossibility of calculating the space to be assigned to any given formation; the endless repetitions and alterations which such an arrangement brings along with it; the impossibility to remove large fixture-specimens at the same time with specimens of easy removal, when

when changes are required to be made, are a few only of the objections to what is vulgarly called a stratagraphical disposition of secondary fossils.

3157. You wish the Committee distinctly to understand that you regard the answers to which you have called their attention, to the effect of oversight on the part of the witnesses that have given them, and are not sustained by the state of things as in your observation they appear?—Yes; and I have a great deal more to say on that subject.

3158. You have referred the Committee to the removal of some of the collections under your charge, which you state you were compelled to effect in "rather a tumultuary manner." It is assumed that you there refer to the same circumstance to which you called the attention of the Committee last year, in answer 2586, and consequently it is expedient to ask you as to the time, when—[as in that answer you stated]—you broke up the entire collection of fossils on Sir Joseph Banks' library being removed to that part of the building where it now is; can you state to the Committee what was the date to which in that answer you referred?—It was in the months of September and October of 1830.

3159. You refer in that answer to an order which you had received from the Trustees upon the subject; what was the date of that order?—The order was dated April 11, 1829; but I did not receive it in writing before October 14, 1830.

3160. Were you aware that the Trustees had ordered that the birds, or the reptiles, or any other division of the Natural History department should be placed in the rooms in which Sir Joseph Banks' library had formerly been placed?—I was, at the time of the first breaking up of the collection, not aware of that circumstance, because I had not received a copy of the resolution.

3161. What interval elapsed between the date of the order and the date at which it was communicated to you, so far as you can now recollect?—It was in 1830, when I returned from the country. I understood that the rooms 9 and 10, in which the fossils were preserved, were set apart for Sir Joseph Banks's library; and I was at the same time given to understand by the clerk of the works, who was my only authority, that the corresponding rooms on the other side of the saloon were to contain the secondary fossils. I accordingly arranged them there; but no sooner had I done so than I was informed it was not the intention of the Trustees that any part of the fossils should remain there, but that they were to be removed to the long gallery.

3162. Had you any reason to suppose that provision would be made in the new buildings for the reception of the fossils?—At any rate I could not expect that the removal should take place before there were cabinets and tables to receive them.

3163. You have stated in your former evidence that you had been obliged to undo and do again the work of years; will you state to what cause you refer as having compelled you to do and undo the work of years?—I should not be able to give the dates without referring to my papers.

3164. Will you supply the dates of any orders which you received directing you to do and undo any of the divisions under your charge?—I will.

3165. Sir *Philip Egerton.*] The Committee have been informed by a witness, in answer 1513, that there is an exhibition consisting solely of plaster-work representing parts of quadrupeds, but that not a real fragment is seen of any one of them; is that the fact?—There is no case that does not contain real osseous remains, together with casts.

3166. The witness alludes to the case in which the plaster casts from Darmstadt, and the Megatherium are exhibited, and also the casts of specimens from the gypsum quarries of Paris; in that case are there any real remains exhibited?—Certainly from the gypsum of Paris.

3167. Mr. *Hawes.*] But still there is an exhibition of bones in stucco?—I do not allow it to be stucco. Stucco implies modelling; the objects in question are casts, which are as good as the originals in every respect. To be sure the Trustees would have preferred the originals if they could have had them; but almost every specimen enumerated by the witness is absolutely unique. He might as well blame the museums of Berlin and of Munich for admitting casts of the Athenian marbles; if they could have obtained the originals, they would no doubt have preferred them.

3168. Sir *Philip Egerton.*] In the following answer, the witness states that there is not a single species or specimen of any extinct zoophyte yet exhibited; is that the fact or not?—The zoophytes are not exhibited yet, because there is no room for them.

Charles König, Esq.

3 May 1836.

3169. Is there any specimen of extinct cephalopod exhibited?—The cephalopoda are not yet exhibited; they take up much room, and there are no cases for them; some were exhibited in the old building.

3170. Are there any exhibited now?—Not at this moment; there may be a few put among the recent species.

3171. But the series of fossil cephalopods is not exhibited for want of room?—Yes; and for want of assistance.

3172. The same witness has stated, in answer to question 1523, that the fossil radiated classes in the British Museum as compared with those of Paris are generally poor, and for the most part nameless; do you coincide in that opinion?—There are none exhibited.

3173. Did not you say that the echinodermata were all named?—Named, but not exhibited.

3174. Mr. *Hawes.*] Is there a catalogue of them?—There are many papers, but they do not, strictly speaking, constitute a catalogue.

3175. They are your own private papers, from which a catalogue may be made?—I consider them Museum papers; many of them are illustrative of specimens named, but not exhibited.

3176. Sir *Philip Egerton.*] With respect to fossil fish, are they exhibited?—Every one we have.

3177. Are they named?—Yes.

3178. What nomenclature is adopted?—That of Dr. Agassiz.

3179. The collection of fossil fish we have been informed is not very extensive; will you inform the Committee whether or not you are in correspondence with Monsieur Agassiz at the present moment, for the purpose of increasing that collection?—Yes; I have just received a letter from M. Agassiz, informing me that he has sent off some valuable specimens from Canton Glaris, that are desiderata in our collection.

3180. Mr. *Hawes.*] There is a specimen, said to be a specimen of saurian remains, now on the floor of the long room in the mineral gallery. Why is that specimen covered over with green baize?—Because I do not know what is to be the fate of that specimen. I am not certain whether or not it will be exhibited; I have not received any instructions relative to it.

3181. Why is it covered over with green baize?—It is covered to prevent the intrusion of the public at large.

3182. Is it to prevent the intrusion merely of curious eyes or of scientific eyes?—At present it is meant as a general preventive.

3183. Why do you wish to prevent its examination as it is placed in the long gallery?—I have reported, and put a specific question as to what the Trustees wished to have done with it; but I have as yet received no answer.

3184. What is the nature of the report that you made to the Trustees respecting this particular specimen?—That it is of no value; and I suppose something to the same effect was mentioned in my evidence of last Session.

3185. Is it a specimen in your opinion entirely made up, without any genuine remains at all?—No; there are bones embedded in plaster, but the authority for placing them in their present position is not evident.

3186. Is there evidence to show that any one of those bones belonged to the same animal?—The evidence may be satisfactory to others.

3187. With regard to the other saurian remains, are you perfectly satisfied that they are all not only genuine, but that the parts are placed together in their natural order?—With regard to most of them there can be no doubt.

3188. Sir *Robert Inglis.*] Are the Committee to understand that, in your opinion, a large part of the specimen now under the green baize in the long gallery, is not composed of real fossil bones?—There are bones certainly.

3189. Is the larger part composed of genuine fossil bones?—Yes; but without adding in the least to the value of the specimen.

3190. Have you reason to think, from a comparison of that specimen with any other specimen known to exist, that the arrangement of the detached bones, admitting that they were detached, is correct according to the science applicable to the subject?—I have no evidence that it is so.

3191. Have you any evidence to the contrary?—I can say nothing on that head.

3192. Comparing that specimen with any other specimen known to exist, or with any description which you have had an opportunity of consulting, do you wish the Committee

209

Committee to understand that in your judgment the adaptation of the parts, assuming it to be an adaptation by Mr. Hawkins, has been made with or without a due knowledge of the subject?—Such comparative anatomists as are acquainted with a species like this, may be able satisfactorily to answer the question proposed; it is impossible for me here to prove that the adaptation of the parts is incorrect; there are bones which apparently have belonged to the same specimen; they are disposed in a particular manner, and restorations in plaster are superadded.

Charles König, Esq.

3 May 1836.

3193. Sir *Philip Egerton*.] You were asked whether any one specimen of extinct zoophyte was exhibited; your answer was in the negative; will you inform the Committee whether any of the crinoidea are exhibited?—Yes; I have put out most of the crinoidea.

3194. Then you wish to make that exception to your former answer?—Yes, and it is a tolerably good collection.

3195. Mr. *Hawes*.] Is there any part of your evidence of last year which you wish to correct or alter?—I have not read it over again, but I think there is not.

Mr. *Edward Lear*, called in; and Examined.

3196. Sir *Robert Inglis*.] YOU are the author of a Monograph on Parrots?—Yes.

Mr. *Edward Lear*.

3197. Your profession is to delineate objects of natural history?—Yes.

3198. Have you visited the museums on the Continent, in which the chief collections of natural history are found?—Some of them; Leyden, Berlin and Frankfort.

3199. Will you state what facilities of access you experienced in the British Museum, both absolutely and relatively, as compared with any other collection to which you have had access?—I have met with every possible facility here from all the officers with whom I have come into contact.

3200. Do those facilities exist in the personal kindness and courtesy of the officers individually to you, or are they, consistently with the general rules and regulations of the establishment, applicable to other individuals as well as to yourself?—I should say the latter, because I received those attentions before I knew some of the officers personally.

3201. Do you frequently go to the Museum for and on behalf of persons engaged in scientific pursuits, with a view to the delineation of objects of natural history for those pursuits?—Very often.

3202. Are you permitted to take down and examine, in every direction in which you may require it, any object of natural history?—I always ask, and permission is always given. Some of the officers take them down for me, and I am permitted to examine them as fully as I may require.

3203. In point of fact, you possess every facility which, as a man of science working in that particular department, you desire to possess?—Every possible facility.

3204. Are you able to state anything as to the relative value of the particular departments, as compared with corresponding departments in the foreign museums which you have specified?—I do not think I am competent to make any comparison.

3205. Are there many gentlemen engaged in the same professional pursuits as yourself, whom you meet occasionally in the Museum?—I have seen several at different times.

3206. Have you reason to think that they experience corresponding facilities to those which you enjoy?—Exactly so; because they have been drawing in the same room with myself frequently.

3207. Mr. *Hawes*.] Would extending the hours of admission be a convenience to you in your profession?—Very great, I should think, to almost all artists.

3208. You frequent the Museum for your professional purposes; are you able to suggest any improvement or any additional conveniences that might be made for your accommodation?—I do not think I can suggest any, except the lengthening of the hours, which would be desirable.

Martis, 10° *die Maii*, 1836.

MEMBERS PRESENT.

Mr. T. G. B. Estcourt.	Mr. Thornely.
Mr. Hawes.	Mr. Baring.
Sir Robert Inglis.	Sir Philip Egerton.

MR. T. G. B. ESTCOURT, IN THE CHAIR.

Mr. *Thomas Thorpe*, called in; and Examined.

Mr. *Thomas Thorpe*.

10 May 1836.

3209. Mr. *Hawes*.] YOU reside in Bedford-street, Covent-garden?—Yes.

3210. You are a large dealer in manuscripts?—Yes.

3211. You have published a catalogue of your collection of manuscripts?—I have.

3212. Can you state the number of manuscripts you have?—I suppose I have between 2,500 and 3,000; my last catalogue contained upwards of 1,400 articles.

3213. You have in your possession a valuable collection of charters, grants and muniments relating to Battle Abbey, the collection of Sir Godfrey Webster?—Yes; 97 volumes folio.

3214. Will you describe the leading features of that collection?—The original cartulary I consider the most valuable article among them, and next to that the Sacrist's Ledger. There are some 2,000 deeds with seals, from the Conqueror downwards, and as many rolls, besides other papers.

3215. Have you fixed any price upon them?—£. 1,200 is the price of them.

3216. Did you communicate that to the Trustees of the British Museum at any time?—No further than by sending a catalogue to the librarian in which the sum is named. There is one distinct catalogue of that collection.

3217. The Committee have been informed that the secretary of the British Museum, Mr. Forshall, has frequently conversed with you as to the purchase of them, and that his attention has been called to these manuscripts perhaps two or three years past, but that he had declined the purchase at the price demanded for them?—I never had any communication with him upon the subject, more than he once said, "I am very sorry we cannot buy them; we ought to have them, but we have not the money." What is more, Mr. Forshall never saw the collections. At the time that he and Sir Frederick Madden came to see them I only possessed a small portion of the deeds, not one-fourth of the collection I now have. Take the cartulary and the ledger away, and I would sell them for 400 *l.* less; I could get 400 *l.* for those two to-morrow.

3218. Has any other officer of the Museum in the manuscript department visited your house with a view to inspect them?—Never.

3219. Sir *Robert Inglis*.] How long have you been in possession of them?—I think four years. I purchased them in three distinct portions; the first I purchased of Mr. Wheatley, and the other two of Sir Godfrey Webster.

3220. Mr. *Hawes*.] Have they not been consulted for legal purposes while they were in your possession?—No; some persons wished to consult the portion that relates to the tithe of Hastings; in fact, one party has threatened to compel me to produce them; the other party offered me 100 *l.* for the loan of one volume, and if they succeeded, 200 *l.*

3221. They were wished for for a tithe cause respecting the liability of Hastings to tithe?—That is the case I am speaking of.

3222. There are some very early documents among them?—There are some of the conquerors; the cartulary contains the foundation deed, and every other deed of his and succeeding kings.

3223. Have you at any time had any transactions with the Museum?—Perhaps I may have sold them 100 *l.* of manuscripts in the last 20 years.

3224. You have a great many manuscripts, relating both to English history and other subjects?—Yes; I think an unrivalled collection.

3225. Have

Mr. *Thomas Thorpe.*

10 May 1836.

3225. Have you made any offer to the Trustees to buy manuscripts on commission?—Yes; I offered to Mr. Forshall, to buy for them at 10 per cent. commission.

3226. What advantages did that offer to the Museum?—I think that if they were to employ me for things which I buy, and other persons in the line in which they buy, they would probably save a great deal of money by it.

3227. Is that upon the notion that the officers of the Museum bidding at a sale, being known as purchasers for the National collection, are more likely to be run up?—I think probably a greater value is set upon the things when they bid for them.

3228. Have you known instances of that sort?—Certainly; I should say that their presence would raise a manuscript 25 per cent.

3229. Can you state any remarkable instances of it?—I can state one particular instance in a manuscript which they returned to me as being too dear, which they might have purchased for 35 *l.*; and when that manuscript was sold at Mr. Heber's sale, they purchased it for 50 guineas, three years afterwards; it was the identical manuscript.

3230. What is the title of that?—Higdens Polychronicon.

3231. As a great dealer in manuscripts, what is your opinion as to the discretion which has been exercised by the officers of the Museum in the selection they have made at public sales of late years?—I should say that I would put that of Battle Abbey against any 2,000 *l.* that they have purchased in sales; and if literary men did not give the preference to the 1,200 *l.* against the 2,000 *l.*, I would give them mine for any value they would think fit to place upon them.

3232. Has there been preference shown for early French romances, when there have been valuable historical manuscripts for sale?—There were some romances, which were purchased within the last few years for about 20 *l.* each by me for Mr. Heber, which were run up to 130 *l.* and 140 *l.* in his sale by the Museum officers.

3233. Sir *Robert Inglis.*] In giving the preference which in one of the preceding answers you have given to the collection made by yourself, as compared with the collection made by the British Museum in the course of the last few years, do you wish the Committee to understand that you are acquainted with the records yourself, with the literature of the middle ages, or with the early French romances of which you spoke; or do you speak in reference to their value, simply from being yourself a great dealer in manuscripts?—I mean as to their value in the market, purchased publicly.

3234. But you do not wish the Committee to understand that you speak in reference either to the legal value or to the literary value of the articles which the officers of the British Museum happen to have preferred, to those which you would have desired them to select?—I am speaking in reference to the value; but at the same time, of course, the interest constitutes the value of the manuscript in the market, whatever it is. I should say there never was in my time a more important volume for them to purchase than the Bible the other day; and they never bid for it.

3235. Mr. *Baring.*] What did that Bible go for?—I think 1,500 *l.*

3236. What was the original price put upon it?—I do not exactly know whether any price was fixed upon it, but certainly the manuscript is cheap to the country; I should say, at the money it was knocked down at, they have nothing equal to it in the Museum or in the country.

3237. Sir *Robert Inglis.*] Do you speak of that upon your own knowledge of the manuscripts of that age, or upon general reputation and belief?—Of my own knowledge of manuscripts.

3238. Will you state what manuscripts of that age you have had the opportunity of examining, so as to enable you to give that information?—I have never seen a manuscript equal to it. I have seen several manuscripts, one or two in the public library at Cambridge. I do not know that there is another in the country; and certainly there is nowhere a manuscript of the same value. The Bezæ Codex is probably the next in value.

3239. Do you prefer this to the Codex Bezæ?—I should, being a Bible of such age.

3240. You speak, however, principally as a professional dealer in manuscripts?—Yes.

3241. In what does the value of this Bible consist?—Its age.

Mr. *ThomasThorpe.*

10 May 1836.

3242. Do you regard it as valuable, critically, from any light which it throws upon disputed texts; or do you regard it as a mere historical curiosity, assuming the fact alleged in the catalogue of its sale, namely, that it is the identical copy translated and presented by Alcuin to the Emperor Charlemagne on the day of his coronation, in the year 801?—That it is the manuscript probably presented to him, I think there can be no doubt; but I think probably written by some scribe of the day, not by Alcuin.

3243. Have you read the last page of that manuscript?—No; I examined it in various places.

3244. Did you examine the part in which a distinct reference is alleged to be made to the two parties, Alcuin, under the name of Albinus and Carolus?—There was a little alteration in the word "Carolus;" there appeared to have been some erasure. I presume that is what is alluded to.

3245. Do you conceive that there was any other word in that last page so important to identify the manuscript as the very word "Carolus," which you have already stated appears to have been written upon an erasure?—I cannot say.

3246. You have referred to the manuscript of Cambridge, which you conceive to be of the same age?—No, I do not conceive it to be of the same age.

3247. Will you describe it to the Committee, or refer the Committee to any other manuscript of the same age within your own knowledge and observation?—I know of none.

3248. With what did you compare this manuscript, when you stated its extreme value?—From its age; I consider a manuscript of the Bible of that period certainly a very important article in a British library.

3249. On what evidence do you state it to be of the age to which it is popularly referred?—From the general appearance of the writing.

3250. Have you compared it with the manuscripts of an earlier date?—No.

3251. Then, not having compared it with the manuscripts of an earlier date or of a date alleged to be contemporary, do you still wish the Committee to consider that the opinion you have expressed is one which you regard to be conclusive?—Yes.

3252. Mr. *Hawes.*] Have you ever seen the catalogues, such as they are, in the Manuscript department of the British Museum?—I have seen them.

3253. Have you ever had occasion to use them?—No, I have not.

3254. You know that they are printed in folio?—They are.

3255. What is your own opinion as to the expediency of printing catalogues of that description in folio?—I should say that it was a size very fit for the library, but not for the generality of readers.

3256. Less likely to meet with general purchasers than if they were printed in octavo?—Yes, the folio size I conceive is inconvenient.

3257. Have you any doubt that if the classed catalogue of manuscripts in the Museum were printed in octavo, like that of the Battle Abbey catalogue, and published in parts, it would be a saleable work?—I should say it would be the best speculation that any man ever made.

3258. And you think it would pay a bookseller for paper, print, and the risk of publication?—There can be no doubt that he would make a great fortune by it; thousands would buy parts that cannot buy all; and they do not want the whole. I think the same question applies to books as to manuscripts. If a gentleman was consulting printed books, he would wish also to consult the manuscripts upon the same subjects.

3259. Sir *Robert Inglis.*] On what experience do you state to the Committee the opinion, that thousands of purchasers would be found for a classed catalogue of the manuscripts of the British Museum if it were published in octavo?—The only reason I have for mentioning a class catalogue is that it would be impossible to publish it in octavo without making an immense number of volumes; but if a person wanted natural history, or any particular portion, they can purchase it for a small portion of what would purchase the whole.

3260. Mr. *Hawes.*] Is it not the habit of every great dealer in books and manuscripts to publish class catalogues?—The French do; and most foreign countries class their catalogues.

3261. Are not the catalogues of all great dealers in books and manuscripts classed?—No; it is much more difficult to find the books; one general alphabet is of much easier reference. A boy in a shop, with one general alphabet, can find anything

anything. If we had a class catalogue it would require a person always upon the spot that knew every book.

3262. Suppose there were a reference in the class catalogue to the books numbered, so as to correspond with the titles in the catalogue, would not that obviate the difficulty?—Yes, if you choose to number the books.

3263. Applying these questions and these opinions to a national library, have you any doubt that in that case a class catalogue is of great importance, and would be a saleable work?—Certainly it would be.

3264. Sir *Robert Inglis.*] On what experience do you found your opinion that thousands of purchasers would be found for a classed catalogue of the manuscripts of the British Museum?—Persons coming and asking for books; for instance, "have you anything on such a subject;" an alphabetical catalogue must be examined all through; whereas, if classed and printed separate, any particular subject, they could buy that class; the thing would be in their own hands.

3265. Can you state to the Committee any instance in which a classed catalogue of the manuscripts in any collection in England, or in any other country, has met with such a number of purchasers as is implied in your preceding answer, namely, thousands of purchasers?—I do not know anything of the kind that is published anywhere.

3266. Then your opinion is an abstract opinion, founded upon what you believe to be desirable, but not upon what you know to have been ever adopted?—No, from persons that have asked. Frequently persons come and ask for a book, under such a class; if the lad is in the shop, he probably says, we have not got anything of the kind; whereas, if we were to print a class catalogue he would give them that part immediately; and it would be the same with the British Museum library, that is so rich in all classes.

3267. Mr. *Hawes.*] In fact, it is founded upon your own experience, in reference to those who have required books upon particular subjects in your own business?—Yes; several classes would be very useful to me, but to hunt through the whole mass of the catalogue more time is lost than I could afford.

3268. Sir *Robert Inglis.*] But you do not class your own catalogue?—No.

3268*. Do you know any other person in the same line of business does class his catalogue?—Yes, there are several.

3269. In manuscripts?—No; I do not know any one that has published a classed catalogue of manuscripts,

3270. Mr. *Baring.*] You sell manuscripts to foreign collections as well as to British?—Yes.

3271. And therefore it is very much your interest to know what manuscripts there are in those several collections abroad?—I never gave myself the trouble to learn, for there is so much difficulty in getting anything sold to a public library that I despair of doing it again.

3272. Whether abroad or at home?—Yes; I have never had any correspondence with the public libraries abroad. I publish my catalogues, and they are for the public; and I sell all I can in a fair way.

3273. Are you aware whether there are any classed catalogues in any of the foreign libraries abroad?—When I was speaking of foreign classed catalogues, I was speaking of those published for sales abroad. I am not aware of any published by public libraries; I have not been abroad myself.

3274. Mr. *Hawes.*] Are you aware that a classed catalogue is forming of the great collection of books and manuscripts at Vienna?—No.

3275. You never heard of it?—No.

3276. Speaking of the alphabetical catalogue to be formed of the books or the manuscripts in the Museum, do you think there would be any difficulty in at the same time forming a classed catalogue?—I cannot conceive what difficulty there can be.

3277. Do you think it would be a work of such great time and expense as not to justify its being undertaken?—I am certain that it would pay for printing; the publisher would sell sufficient to pay for itself.

3278. And it would answer to publish the parts as they were formed, without waiting for the completion of the whole?—I have no doubt of it. If they would not sell them singly, they might just as well keep to folios.

3279. Mr. *Baring.*] Do you know the extent of the collection of manuscripts in the British Museum?—No, I do not.

3280. Supposing there were 23,000 volumes of manuscripts in the British

Mr. *Thomas Thorpe.*

10 May 1836.

Museum, what expense do you think the formation of a classed catalogue would occasion?—It would be impossible for me to tell. Some of those volumes will contain 20 or 30 or 40 manuscripts.

3281. Mr. *Hawes.*] Assuming that some catalogue is necessary, then, do you think there would be any difficulty in forming a classed catalogue?—If any catalogue can be made, a classed catalogue can be made.

3282. If an alphabetical catalogue can be made first, a classed catalogue can be made at the same time; and of course with corresponding economy?—Of course.

3283. Did you ever see a manuscript, called the Cartulary of the Church of Ely?—Not that I am aware of.

3284. Have you seen any cartulary of any large cathedral similar to the Ely manuscript?—It is impossible for me to tell, as I never saw the Ely.

Mr. *Robert Harding Evans,* called in; and Examined.

Mr. *R. H. Evans.*

3285. Mr *Hawes.*] ARE you well acquainted with manuscripts and printed books?—I have had very considerable experience in them for 37 years.

3286. Have you ever had occasion to turn your attention to the comparative value of alphabetical and of classed catalogues?—Of course it has been frequently under my consideration. Both have their advantages; but I should make a wide distinction between a small library and a public collection.

3287. The question is asked with reference to the collections of printed books and manuscripts, more particularly in the British Museum?—I think there cannot be a question, but that, with respect to the manuscripts, a classed catalogue will be most advantageous; and I draw this inference from the fact, that frequently, when literary and scientific men are writing upon a subject, they would wish to know what information they might derive from the British Museum manuscripts upon those particular subjects. Now if there are only alphabetical catalogues, unless they go through those from the first to the last, they cannot tell whether there are any manuscripts upon the subject preserved in the British Museum. For example, Mr. Southey is writing a History of the Monastic Orders in Portugal; if there were classed together all that related to Portugal, it would save him an infinity of trouble; he would get his information at once, and he would know whether he could derive information for his book, or whether it was in vain to seek for it.

3288. From your general experience in matters of that kind, do you think it impracticable to form such a catalogue of the manuscripts in the British Museum, or do you think the expense will be so large as to justify the Trustees in abstaining from forming such a catalogue?—A great deal has already been done by the printing of the Cotton and Lansdowne manuscripts, and of the Arundel; and I understand the Burney collection is in point of being delivered to the public.

3289. Sir *Robert Inglis.*] Of course you include the Harleian?—I mean to state all the printed catalogues.

3290. Mr. *Hawes.*] Are you aware there are still a great number of volumes uncatalogued?—A very considerable number; to what extent I do not know. I should conceive that, without any great difficulty, a catalogue might be made, and without any very unreasonable loss of time; but if such a catalogue were undertaken, I hope that it would be a very great object with the Museum to mark from what collections the manuscripts come. For instance, in the case of "Homer's Odyssey," to mark the Harleian collection, and in the "Iliad" the Townley collection; because scholars have referred to them, and they are known throughout Europe by those names. I consider that the manuscripts would be better known by such a reference; and it would be very little trouble to put L. for Lansdowne, and B. for Burney, and so on.

3291. Have you had occasion to consult catalogues in the British Museum?—Occasionally I have looked at them.

3292. Do you think them well adapted for the purpose of research?—They are inconvenient, inasmuch as you are obliged to refer to the Index to know what exists, which is generally the case; and in many manuscripts there will be 20 in a volume, and those of the most distinct nature; for instance, in the Archbishop of Canterbury's library there is a romance bound up with theological tracts.

3293. What is your opinion as to the mode of publication in folio?—I think the

the age of folios has almost passed; the public do not like them; the octavo would be far more portable and far more convenient.

3294. Is it your opinion that many of the catalogues are far too expensively got up?—I should say, far from it; the Cotton Mauuscripts and the Harleian are printed upon too indifferent paper.

3295. Take the Arundel, for instance?—Very well got up; I cannot conceive anything better conducted; I may differ as to the classing, but nothing can be better got up.

3296. Do you think it desirable to publish it so expensively?—I should not consider expense; I should consider the public benefit.

3297. And you think in that case the benefit is equal to the expense?—More than equal.

3298. *Chairman.*] When you say that you should not hesitate on the point of expense, do you refer in that opinion to the probability of extensive sale of the catalogue?—I conceive that those publications are for the public benefit, that literary and scientific men may avail themselves of the information the books and manuscripts contain; others are more for curiosity; but I think a catalogue should be printed, even though it were at a certain loss.

3299. Do you think that the catalogue might be printed in a cheaper form and still be of the same utility, so as to be more attainable by the public, and answer all the purposes, and be a creditable publication for a great institution?—Assuredly; but then you must decide whether you would print it in a small octavo or a royal octavo, because a small octavo would scarcely admit of adequate space for fac-similes.

3300. Consequently you would not recommend a smaller size than a royal octavo?—No, not for manuscripts; but for printed books I would.

3301. Sir *Robert Inglis.*] Would you desire that the Harleian Catalogue, for instance, should be printed in octavo?—I certainly would prefer it; it would be also a very great object in doing that, at the same time to compare the articles with the manuscripts, because the knowledge of palæography has greatly increased even within a few years, and errors might be corrected.

3302. Mr. *Hawes.*] Is it your opinion that the catalogue of manuscripts should be a classed catalogue?—I would prefer it decidedly for manuscripts, and I think it is more useful for printed books; but I should always presume that there would be a copious alphabetical index annexed.

3303. That is to say, alphabetical index of authors names, and subjects at the end of each volume?—Yes; when the Harleian Catalogue was first published one of the original compilers was a man of great learning; but there is no question that the British Museum was never better officered than at this moment, and that they would be able to make valuable and important corrections in different parts of the catalogue.

3304. With that opinion, do you think the present state of the manuscript catalogue in the Museum is creditable to a national establishment?—I do not think it discreditable; but I think it might be put on a much more creditable footing.

3305. Some are printed, and some in manuscript, and some with, and more without indexes; is it not so?—The Harleian has an index, the Cotton has an index, the Arundel has not; but it was notified that when the Burney collection was completed an index would be given to the two.

3306. Are you extensively acquainted with many instances of classed catalogues of printed books?—Yes; foreigners are more in the habit of classing their catalogues than we are.

3307. Do not you think that a great public library is susceptible of much greater utility when possessing a classed catalogue?—Certainly it is.

3308. Sir *Robert Inglis.*] Can you state any instances of classed catalogues of large collections existing in Europe?—I really at the present moment cannot charge my memory.

3309. Is there a classed catalogue at Paris?—I believe not; but neither is there an alphabetical catalogue. Some years ago, I believe, the French published, about the middle of the last century, eight or nine folio volumes of the catalogue of printed books; but the classed catalogue of manuscripts has never proceeded to any extent.

3310. Mr. *Hawes.*] Are you acquainted with the catalogue of printed books in the Museum?—I am.

3311. Do you consider it convenient for reference?—I would prefer a classed catalogue;

Mr. *R. H. Evans.*

10 May 1836.

catalogue; but I certainly should say, that if that catalogue was to be reprinted, it ought to be gone over by the officers of the Museum, than whom none are more competent, with a view to curtailing certain titles of unimportant books, and extending the titles of some more important books which are little known.

3312. As to the expediency of printing an alphabetical catalogue, or a classed catalogue, what is your opinion?—If I were to give my own opinion, I should say that every great public institution of printed books ought to have two catalogues, one alphabetical and the other classified.

3313. Which would you print?—I would print both; because I think the advantage is so great, and that it cannot be attended with any considerable loss.

3314. Sir *Robert Inglis.*] You have stated that you recommended that the officers of the Museum should revise the printed catalogue; are you aware that that process is at this moment pursuing by the officers of the Museum?—No, I was not.

3315. Can you state to the Committee what proportion of volumes in octavo would be occupied by the reprinting of the Harleian catalogue of manuscripts, for instance, if it were desirable that it should be reprinted in octavo?—I could not say with exactness; but any printer could state in a few minutes. If there were catalogues of the separate classes of the printed books many would buy what related to their own line of collecting. Some would be very glad to have history; others would buy poetry; and each division would have separate purchasers. And it would be a great advantage to the public if they were to be purchased, not merely as a set but as separate portions.

3316. Can you state any instance in which in any collection the plan which you now suggest has been adopted?—I cannot; but I think the publication of the catalogues of public libraries has been too much neglected throughout Europe. The French began a printed catalogue, but they seemed appalled by the extent of the undertaking.

3317. Then, whatever may be the desirableness of the object, no public institution has ever adopted the plan?—I have never been to St. Petersburgh; but I understand that there is a double catalogue of the imperial library, either printed or preparing, one alphabetical and the other classed; and I have understood that they mean eventually to publish a third, with critical remarks and literary notices.

3318. Mr. *Hawes.*] A catalogue raisonnée?—Yes.

3319. Supposing such a catalogue had never been published by any one institution, would your opinion as to its necessity or utility be altered?—Not the least in the world; on the contrary, it would be increased, because the less we have of those lists of books the more important it would be to obtain one.

3320. Do you prefer printed catalogues, both alphabetical and classed, to what has been called a living catalogue, or the librarian well acquainted with the library?—Without any disrespect, I am not aware of many persons who could be called living catalogues of printed books; I scarcely know a man, except Mr. Van Praet, in Europe; I have had the honour of knowing him the last 40 years, and with respect to the knowledge of books, I never found so much combined in one man.

3321. Notwithstanding that, you would still prefer the solid security of a printed classed catalogue even to his memory?—Certainly; for instance, he is now greatly advanced in years, and the French never will be able to replace him.

3322. Did not Sir Joseph Banks go to some expense in publishing a classed catalogue of his collection of natural history?—In five volumes, made by Dryander; and it is a model of a catalogue.

3323. Would not one effect of a good classed catalogue be this, that by informing the public of the wants of a great public library it would lead to the presentation by individuals of such books, or collections of books, as would be most likely to enrich it?—Certainly, literary men would occasionally suggest books that were wanting. May I state, that even in alphabetical catalogues the makers frequently perceive the inconvenience of their not being classed, and they endeavour to remedy it. It occurs to me at this moment, if I remember right, under the head Aristotle, in the British Museum catalogue, there is about half a page of references to commentators, which shows that they would think it convenient to bring together that knowledge.

3324. Sir *Robert Inglis.*] In your answer to the last question, did you contemplate that the classed catalogues should contain not merely the treasures actually in possession of the library but also the desiderata?—No; I intended to state that, if a classed catalogue was published, literary and scientific men on perceiving deficiencies would suggest to the Trustees of the British Museum the

acquisition of such books; whereas nobody could be expected to go through an alphabetical catalogue to suggest deficiencies.

3325. Mr. *Hawes.*] A catalogue comprehending the whole range of literature would be a magnificent work in itself?—It would almost make the publication useless, as it would extend so very far.

3326. Is not that, in point of fact, the object of "Watts's Bibliotheca," and the principle upon which it is constructed?—That is divided into two parts; one contains a list of authors, the other is arranged under subjects by which you may refer to what has been written upon any topic, and find references to the different authors who have treated upon it.

3327. That is a work which does, to a certain extent, point out these desiderata in libraries?—It does; it is a work that I have never looked at without astonishment, though I am aware of its numerous inaccuracies; but it reminds one of the time when, as Gibbon expressed it, men devoured and digested a whole library.

3328. Sir *Robert Inglis.*] With reference to the probable amount of sale of a classed catalogue, if published in octavo, can you state from your experience what would be the probable amount of such sale, looking at it as a mere article of commerce?—I have already stated, that, though I were certain that it would be attended with loss, I should not scruple to have it undertaken. With respect to the sale of a catalogue of the manuscripts, I should doubt whether it would be attended with a remuneration of any considerable extent, because persons who would purchase catalogues of manuscripts would be those that would wish to make use of them, which would be a limited number; but with respect to the catalogue of printed books, I have no hesitation in stating that the public would have the expense repaid, and more than repaid.

3329. By the publication of a classed catalogue as distinguished from an alphabetical?—Yes.

3330. Mr. *Hawes.*] Confining your answer to a catalogue of manuscripts without following it with publication, do not you think it desirable that it should be retained for use in the Museum; for instance, though in manuscript?—I conceive that it should be printed; I do not think that retaining it in the Museum would answer the purpose: for instance, supposing a gentleman living at Newcastle was editing "Bede's Ecclesiastical History," or "Eusebius," he could not avail himself of the knowledge of what was in the Museum without making a journey to town, but if the catalogue were published he would be able to see at once whether there were any manuscripts which would be serviceable to him, and whether it would be worth coming up to town to consult them.

3331. Are you able to give the Committee any information as to the assistance that Watt had in forming his "Bibliotheca?"—I apprehend very little.

3332. It may nearly be considered as the work of one man?—I believe it was nearly done by himself; but after he became ill he was assisted by his son, who completed it after his death.

3333. Do you know whether it is very much used in the Museum?—That I have not the means of knowing. I was asked with respect to the sale of an alphabetical catalogue; when the Museum catalogue was sold, owing to the price put upon it it did not sell. If I recollect right, Mr. Croker put a question in the House of Commons upon it, and it was reduced from nine guineas to four and a half guineas.

3334. *Chairman.*] That was not sold in parts?—No; and it was too dear for public use.

3335. Sir *Robert Inglis.*] You referred to Mr. Southey, in his projected History of the Monastic Orders, as likely to feel a considerable advantage from a classed catalogue of the manuscripts of the British Museum; do you consider that Mr. Southey, or any other literary man engaged particularly as Mr. Southey is in works of so general and miscellaneous a character, may not, in the course of his pursuits, have cast his eye over the volumes as they stand now of the catalogues of the manuscripts, so as to know generally what their contents may be, so far at least as to see that they do or do not contain matters relating to his own particular object at the moment?—No, I do not; I think it would be embarking on too great an ocean to examine the catalogues in their present state; and literary men are considerably deterred by it.

3336. Mr. *Hawes.*] And in fact it is imposing so much additional labour upon them?—It is; it would be a great economy of time if they were classed; and the great expense of the alphabetical catalogue of the books which has been published

Mr. *R. H. Evans.*

10 May 1836.

is a prohibition to literary men; very few working scholars can afford to purchase it.

3337. Sir *Robert Inglis.*] The question last put referred not to the catalogue of printed books, but to the catalogue of manuscripts?—Yes; the inutility of this catalogue cannot be stated more strongly than to say that the Cotton catalogue, for instance, is at this moment positively waste paper; you can buy a copy of it bound for less than the binding cost.

3338. *Chairman.*] Why is that?—Because it is a confused and undigested mass.

3339. Mr. *Hawes.*] Your attention is requested to the following question and answer: "From the rapid increase in the number of works that are published, would a catalogue made this year be very available a few years hence?" The answer is, "No; it is like a law book; it would grow obsolete in a short space of time, it would want constantly reprinting to keep it up as a record of knowledge. Librarians are living catalogues, and can usually be consulted to greater advantage for a continuance." What is your opinion of that answer, and how would you answer that question yourself?—I should say that, supposing it was practicable to complete a catalogue in the course of next year, it would be available for many years, because the British Museum might do what the Bodleian Library does, issue an annual catalogue of their acquisitions.

3340. Which addenda or appendixes would be incorporated in the new editions when they multiplied to a great extent?—Of course.

3341. Have you lately sold the celebrated Charlemagne Bible?—Unfortunately I have not; I put it up for sale.

3342. At what sum was it bought in?—At 1,500*l.*

3343. Did you receive any application from the Trustees, or any officers of the Museum, respecting the value of the Bible, or the purchase of it?—I believe not, prior to the sale; subsequently I had conversation with Mr. Forshall and Sir Frederick Madden.

3344. Did you take the opinion of any eminent men as to its value before the sale?—Not prior to the sale. I have had 37 years' experience; and though I have no pretensions of a literary nature, yet from the time that I left Westminster School I have been very much attached to literary subjects, and have endeavoured to gain information with reference to books and manuscripts. I drew up the catalogue, in which I gave some of the first testimonies in Europe to its intrinsic value; and subsequently to the sale Mr. Forshall called upon me, and he seemed to think it would be of great national importance if the British Museum could acquire it; and he wished me particularly to obtain the opinion of Sir Francis Palgrave upon the subject, and I did so.

3345. Will you state that opinion?—I stated, both to Mr. Forshall and Sir Francis Palgrave, the sum peremptorily fixed on it by the proprietor; and I told them that I had required to have it in writing, that it might be seen that I had never varied from my instructions in asking more than his price. I mentioned to Sir Francis Palgrave, that the sum was 1,500*l.*, and that I wished him to give his opinion, whether it was for or against the purchase.

3346. Will you state the general substance of that opinion?—With the permission of the Committee, I will read Sir Francis Palgrave's opinion. Sir Francis Palgrave said that he had not the slightest objection to give me his opinion, provided he gave it me in writing, so that no misunderstanding might arise, and if I allowed him till the morning to do so; when I received this communication from him: "Alcuin's Bible appears to me to be a manuscript of the greatest importance, not merely as an historical curiosity, but as one of the landmarks in the annals of palæography and of art. One of the chief difficulties which we meet with in palæographical investigations is the paucity of manuscripts to which a definite date and a specific locality can be assigned, for it is only by comparison with such muniments that the æra and origin of other manuscripts can be determined. I cannot speak as to the commercial value of the manuscript; but, considering its unique character, and the circumstance that all similar articles must gradually disappear from the market by the purchases made for public collections, I do not hesitate to say that the Trustees of the British Museum will render a great service to their institution if they acquire it for the sum of 1,500*l.*

(Signed) "*Francis Palgrave*, April 30, 1836."

3347. Did you obtain any other opinion?—Mr. Forshall named the right Hon. Thomas Grenville. I mentioned to Mr. Forshall that I should call upon Mr. Grenville

Grenville, lest I should seem to evade the question; but that I was quite sure the answer Mr. Grenville would make to me would be, "You know that I have been all my life a collector of printed books, and therefore I do not feel myself competent to give an opinion upon the question of a manuscript." Mr. Grenville, after he had looked over it, said, "Were I to look at it, I should say, (divesting it of all the interest as regards the historical circumstance attached to it from being in the first place written by or under the revision of Alcuin, and secondly, presented to Charlemagne), but merely considering it as a manuscript of that date, I should consider it was worth 1,200*l.* What additional sum should be affixed to it as having been written by Alcuin, or under his superintendence, and having been presented to Charlemagne, I am unable to state; but an addition should be made on those accounts." This opinion appeared to me to approximate very much to my valuation of it.

3348. Has any other eminent individual, a Trustee of the Museum, expressed any strong opinion upon the subject?—Certainly; Sir Robert Peel did. He said to me "I consider the acquisition of this manuscript of such importance, that I shall feel it my duty to state that opinion to Mr. Spring Rice."

3349. You consider his opinion upon this subject as entitled to weight, not only from the position he holds in the country, but from his acquirements as a scholar?—Certainly; I attach the highest importance to his opinion.

3350. Sir *Robert Inglis.*] Is that the catalogue of the sale at which the manuscript in question was put up (*the same being shown to the witness.*)?—It is.

3351. Are you the author of the title-page?—Unquestionably I am.

3352. The title-page states that the Bible in question "is unquestionably the most ancient manuscript of the entire version of the Holy Scriptures, by Saint Jerome." On what ground did you state this?—I need scarcely state that in the period in question, there were two classes of manuscripts of the Holy Scriptures, the one called the Pandect of the Old Version, and the other the Pandect of the New Version; meaning thereby the Version of St. Jerome. In the British Museum I am perfectly aware that there are more ancient manuscripts of portions of the Scriptures; the Four Gospels, for instance.

3353. Do you state that "this is unquestionably the most ancient manuscript of the entire version of the Holy Scriptures by St. Jerome"?—I have stated that in the presence of many persons; prelates, distinguished scholars, and other literary characters. I have not heard one call it in question.

3354. Mr. *Hawes.*] You spake of it as a whole?—Yes, as a complete transcript of the version of St. Jerome, the most ancient now known.

3355. Sir *Robert Inglis.*] Did Alcuin present any other transcript to any other person?—In Alcuin's works you will find an answer to a letter from Gisla, the sister of Charlemagne, in which he says, "I send you the Gospel of St. John; I cannot send you the three remaining Gospels till I shall have finished writing a complete Bible for your brother."

3356. Do you know the library at Vienna?—I never was at Vienna.

3357. From general information, do you know whether there be any other manuscript Bible of Alcuin's recension of the version of St. Jerome in that collection?—I am not aware with respect to Vienna; but I have conversed with Dr. Wiseman, from Rome, the celebrated Roman-catholic, who is now preaching in London, and about to return to Rome; he told me there was one at Rome; and to my own knowledge there is one at Paris, executed for Charles the Bald, of that recension.

3358. Of the same age?—Nearly half a century later; and in Alcuin's works there is a letter to his disciple Nathaniel, in which he tells him that, from his advanced age, he shall not be able to go to Rome to present the Bible, which he has finished, to the Emperor Charlemagne; and requesting him to take it in his name. There is also a most interesting letter in Alcuin's works, in which he writes to the Emperor Charlemagne, and tells him he gives the Bible to him, for he is sure that there is no work which would be so acceptable to him; and that while writing it, he seemed as if the Holy Spirit was inspiring him. Now, I do not mean to say whether this Bible may have been written by Alcuin, or under his superintendence, but that it was the one or the other I have no doubt. If it was under his superintendence I should attach much the same importance to it.

3359. Did you ever hear of a copy belonging to the church of St. Mary de Valliscellana Rome?—Certainly.

3360. What is your opinion of the value of that?—From what I have collected from literary persons, I should suppose that it was a transcript of this identical book, because the name of Alcuin's Bible became familiar from his making a careful

Mr. R. H. Evans,

10 May 1836.

careful revision of it, in the same manner as we should in familiar conversation say Stevens's Shakspeare. In this manuscript there are some verses which are not in the transcripts, and which strongly confirm this being the prototype. Here is the following apostrophe to Our Saviour, in this manuscript:

" Hæc dator æternus cunctorum Christe bonorum
Munera de donis accipe sancta tuis
Que pater Albinus devoto pectore supplex
Nominis ad laudem obtulit ecce tui
Quem tua perpetuis conservet dextra diebus
Ut felix tecum vivat in arce poli."

These words are not in the manuscript at Rome, as I am informed, certainly not in the manuscript of Charles the Bald at Paris. The French have a great national enthusiasm in whatever regards their literature. There are certainly some great names in France, which I would not hesitate to oppose to any that may be here, and they have asserted that this is the manuscript executed for Charlemagne; but in so doing, they degrade into the second class their own manuscripts of Charles the Bald, which they always maintained were the most ancient; and therefore I should call them reluctant witnesses to the fact.

3361. In the catalogue which has been shown to you, in page 4, there is a line quoted from the reverse of the last leaf of the New Testament, in which line these two words occur, " Is Carolus," referring, of course, to the Emperor Charlemagne. Do you remember that when I had the pleasure of examining that manuscript with you, I took my glass, and pointed out an apparent erasure over which the name Carolus had been written; and if so, is it or is it not explainable consistently with your view of the manner in which the identity of the manuscript is made out?—Yes; I recollect that it was pointed out, and I admit that it is a fair matter of investigation. It appears as if there was a tracing over of the letters where the ink had failed. It is an unfortunate circumstance; but I would observe that the person who has altered it with the ink has equally done it with the relative article " quæ," where no other word could by possibility be used; and I should wish particularly to remark, that the words " pater Albinus " are indisputably not altered. I need not mention that he uses " Albinus " for Alcuinus; that those words indisputably mean the same person; there is not the slightest alteration whatever about the " pater Albinus;" all that part is as clear as can be. But I would state another ground. Supposing that leaf was wanting, I would ask, is the knowledge of palæography reduced to this narrow state that without that word we could not fix the date. What became of the monograms; what became of the notarial marks which Sir Francis Palgrave immediately recognised upon his first examination of the manuscripts.

3362. You have stated that you have heard of a copy belonging to the church of St. Mary de Valliscellana at Rome?—Yes; here is a work, published at Paris, giving a minute account of that Bible (*producing the same.*) I have already stated that none of the manuscripts known contain those verses addressed to Our Saviour. Here is a comparative statement of the comparison of the two.

3363. This pamphlet professes to give a description of the identical Bible offered for sale by you last month?—It does.

3364. In page 21 of that volume, reference is made to the particular manuscript forming the subject of the preceding question?—Yes.

3365. Will you see whether the 13th and 14th lines of that inscription have not a direct reference to Carolus, assumed to be the same Charlemagne?—Those words are precisely the same in Charles the Bald's copy at Paris.

3366. Then you do not assume that the " Carolus " of that inscription refers to Charlemagne?—It refers to Alcuin's manuscript, written for Charlemagne, and is a transcript; just as Ben Jonson's verses on the portrait of Shakspeare, in the second, third, and fourth editions, are copied from the first.

3367. Do you conceive that it gives any authority, as the evidence of literary history, to one or to the other of the manuscripts?—The object of this is to show that, on due consideration, the Valliscellana manuscript is of a later period, and is, in fact, a transcript.

3368. Do you know anything of the Bible, prepared under the superintendence of Alcuin, for Gerfridus?—No, I do not.

3369. Mr. *Hawes.*] What is your opinion of the expediency of keeping the collections of books apart and distinct in the library?—I confess I do not attach any importance to that myself, because if there is a good catalogue of reference it will at once refer you to the places where the books are; and for manuscripts it is very difficult to do it.

3370. Then you would not consider it desirable to keep the different collections of books that are in the library distinct in the catalogues?—With respect to classification on the shelves, I think it a very subordinate object. May I be permitted to make one remark upon the verse of Carolus, in page 22, in what I call the original Bible of Alcuin, written for Charlemagne; there is one part of the line which I think it important to point out to the Committee. The verse stands thus, "Is Carolus qui jam scribe jussit eum." Now in those words I should not consider the "jam" as a mere expletive; it denotes, I think, that it was only recently executed, and the others are altered to "Tot Carolus Rex qui scribere jussit eum."

3371. Sir *Robert Inglis.*] Does not "tot" always refer to "quot?"—I think not; indeed I can cite instances where it is used absolutely in the classics.

3372. At least by implication?—Then it may be considered as implied here. The disputed verse of the Heavenly witnesses in St. John's Epistle is omitted in this manuscript; and there is a curious variation in the 4th chapter of St. Luke, which shows that it has been from St. Jerome's version. In the Greek Testament, when the Devil is tempting Our Saviour, he says, "Get thee behind me, Satan." Now those words are not in this manuscript, and they are not in the printed copies of St. Jerome's version.

John Mee Mathew, Esq. called in; and Examined.

3373. Mr. *Hawes.*] YOU are a Barrister, and a Fellow of the Antiquarian Society?—I am.

3374. Have you had occasion to visit the British Museum for the purpose of inspecting manuscripts occasionally?—I have not been to the British Museum for two years past; but previously to that period I went there occasionally in search of manuscripts, relating to Staffordshire, being then and at the present time collecting materials for a history of that county.

3375. Did you find great facility from the catalogues you referred to, in putting you in possession of the contents of the Museum?—No; on the contrary a great portion of my time was taken up in going through the catalogues, and the arrangement of which was so bad that I was obliged to desist, as at that period it occupied more of my time than I could afford to give up.

3376. Do you know how many various catalogues you had to consult?—I do not know exactly; there are many volumes, but I did not pay particular attention to the number. To the best of my recollection, there are upwards of 20 folio volumes of them. However they were so numerous, and the labour would have been so great, that I desisted.

3377. Is it your opinion that a classed catalogue would be a very valuable addition to the library, and very useful to the public?—Very useful; had there been a classed catalogue to consult, I could have referred to the head, Staffordshire, immediately, and immediately have found what I wanted.

3378. If such a catalogue were printed in octavo, in parts, do you think it would be likely to meet with extensive sale and general circulation?—I should say so generally, particularly to those persons engaged in professional and engaged in scientific researches. I invariably make a point of always purchasing classed catalogues of public or extensive private libraries.

3379. Are you at all able to state how many volumes of manuscripts there are without indexes?—Not the exact number; but I should say some thousands.

3380. What is your opinion as to there being catalogues in the Reading-room without indexes?—To the best of my recollection there are many volumes without indexes; but I cannot enumerate them particularly.

3381. As to the alphabetical catalogue of printed books, do you think that is convenient for reference?—No, the volumes are so numerous that it would be great labour and great loss of time to go through them. For instance, in an alphabetical catalogue the author's name is first given, and then the work, as Hume (David), History of England, &c.; so that if I wish to consult any work in law or British history, unless I first know the name of the author of that work, I should have to wade through 50 volumes of catalogues (many of them referring to each other), before I could attain my object, and the entire day might be lost; but if the catalogues were classed, I should immediately turn to the head Law, or British History, and at once find the book.

3382. Therefore, in your opinion, a classed catalogue of printed books would be most desirable?—Most desirable; it is the case in foreign libraries that I have visited;

John M. Mathew, Esq.

10 May 1836.

visited; there is generally a classed catalogue, in manuscript, lying in the room, and you can refer to the book you want immediately.

3383. Do you refer to some of the provincial libraries of France?—Provincial libraries in the different towns which I have visited in the last two or three years.

3384. Will you state whether you saw a good class catalogue of the library at Bordeaux?—Both at Bordeaux and at Tours; I resided in the latter city several months, and was in the habit of frequently going to the library, where a classed and alphabetical catalogue, in manuscript, lies on the table. The library is not very large, but it is conveniently arranged.

3385. What is the extent of the library at Bordeaux?—I should think the library at Bordeaux must contain about 100,000 volumes; it is considered a fine library, and the books are catalogued in classes.

3386. Can you state the number of volumes in the library at Tours?—The library at Tours is much smaller; it comprises, perhaps, 40,000 volumes. In most of the provincial towns of France there are libraries and museums, which are in general very well arranged.

3387. Sir *Robert Inglis.*] Were you rightly understood to state that there was an alphabetical printed catalogue of the library at Bordeaux, and a manuscript class catalogue?—No; I never saw a printed catalogue, either classed or alphabetical. The catalogues used are in manuscript, and are corrected by the librarian.

3388. Mr. *Hawes.*] Is there not a printed catalogue of the library at Lyons?—I am not aware of it. I never was at Lyons.

3389. Do you know how many of the provincial towns of France have public libraries?—I do not know the exact number; most towns of consequence have libraries, and duplicates are regularly exchanged between them.

3390. Is there not something like a Commission of Inquiry set on foot by the Government, for the purpose of ascertaining duplicates and distributing books?—I believe there is; indeed I may say that I know such to be the fact. Most of the provincial libraries have been inspected for this purpose, under the sanction of Government; and I believe the reports have been laid before the Chamber of Deputies.

3391. You do not know the total number of volumes in the public libraries in the provincial towns of France?—I do not.

3392. Sir *Robert Inglis.*] Can you state what is the space occupied by the books in the public library at Bordeaux, as compared with the space occupied by the King's library in the British Museum?—I should think the space occupied by the books would be nearly equal.

3393. Mr. *Hawes.*] Are you at all acquainted with the Battle Abbey deeds and manuscripts in the possession of Mr. Thorpe?—Yes, I am; it is a collection which has very much attracted my curiosity.

3394. Have you examined them with much care?—I have, very minutely, having devoted many days to the subject.

3395. Can you enumerate the different deeds, those of the greatest importance?—A great many of them. I consider the Cartulary, and the Register, two of the most interesting and important documents. The early deeds, too, comprise an unrivalled collection of original grants during the reigns of Will. 1 & 2, John and Henry 2 & 3, including several from the monarchs themselves. The whole of them are in the highest state of preservation, very few being stained, and most of the seals entire; and, independently of their national importance, would be valuable as beautiful specimens of the writing of those early ages.

3396. Will you state your opinion generally of them?—I should say that they are the finest and most valuable collection I ever saw relating to one institution, and are worthy of being enrolled amongst our national records.

3397. Illustrative of the manners and customs of the early ages?—Yes, most particularly. The rolls of accounts of the different Bursers of the Abbey contain very curious and descriptive items of expenditure, elucidating both the national and monastic habits of the periods to which they respectively refer.

3398. Can you form any opinion as to their value for a national museum?—I should say that they are invaluable to a national museum, and that a collection of documents connected with an institution which was founded to commemorate the most important epoch in British History, ought not to be left in the hands of any private individual.

3399. Have you heard that any exertions have been made by the Museum to obtain them?—No, I have not; but I think the Trustees ought to purchase them.

Looking

Looking at them as an amateur, and considering the extent of the collection, amounting to 97 folio volumes, I should say that they are exceedingly valuable, and that the price fixed upon them by Mr. Thorpe is very reasonable.

3400. In a legal point of view, do you consider them very valuable?—Certainly, more particularly as regards tithes, and the descent of lands.

3401. Have you frequented the reading-room of the Museum much?—Not much; I have not time to do so.

3402. What would be your opinion as to the extension of the hours of admission to the reading-room?—The hours that the Museum is now open are perfectly unavailable to members of my profession, because the Court seldom rise till four or five o'clock, at which time the Museum is closed. To us the evening would be preferable.

3403. Speaking as a literary man, do you think it would be possible so to arrange the use of the reading-room in the evening, as to ensure the most perfect security?—Certainly; I should think there could be no difficulty in doing that.

3404. In your opinion it would be of great advantage to the profession, more particularly were it open in the evening?—Certainly.

3405. Sir *Robert Inglis.*] To your profession as such, or to the members of your profession in reference to their other pursuits?—In reference to both; many a barrister cannot afford to have an extensive library of his own, and being generally, from his education, a literary character, it would be a great advantage to him to have the resources of the British Museum open to him at those hours, when he could devote to it his leisure, without interfering with his professional pursuits.

3406. Mr. *Hawes.*] Do you attach great importance to exhibiting the collections of the Museum to the public generally, in reference to the improvement both of taste and morals?—I should think such an exhibition of the highest importance.

3407. Do not you consider that on great public holidays, the collections at the Museum should be open to the public?—I should say so; for instance, the Louvre at Paris, which is open to the public, is continually crowded; and there are always more people on Sundays than on any other day.

3408. Sir *Robert Inglis.*] Do you recommend that the Museum should be open on Sundays?—I conceive it should. I think it would be one of the very best modes of counteracting the effect of gin palaces.

3409. Mr. *Hawes.*] Allowing the collections to be exhibited on a Sunday would in your opinion be one of the best means of improving the morals of the working classes?—Yes, I decidedly think so.

3410. It would tend to give them a taste for objects of natural history, rather than a taste for gin?—Unquestionably; it would be one of the best modes of improving the morals of the people.

3411. What is your opinion of the importance of forming district libraries in a great metropolis like this?—It is very important; there is one at the London Institution, in which the books are well catalogued.

3412. What kind of catalogue is it?—A classed catalogue.

3413. And that is found of great utility?—Certainly.

3414. Do you know the price of it?—I do not.

3415. One object of the Museum, speaking generally, being to encourage literature and science; do you think that object is generally fulfilled with regard to its constitution or to its administration?—I should say that the British Museum is chiefly frequented by men of science and literature, who have a professed object in view; they frequent it for a purpose, and are probably engaged in the preparation of works, which constitute the express business of their life, and from the sale of which they get their bread. I should say that it is more used by literary and scientific men, than by the public in general; though, of course, the public are admitted.

3416. You think it rather too exclusive in its rules and regulations?—I should say that it is exclusive as to time; the hours, from ten o'clock to four, are too limited for the public generally, and consequently they derive no benefit from so great an institution.

3417. Sir *Robert Inglis.*] To what rules or regulations do you refer as too exclusive?—I mean merely as to hours.

3418. You do not believe that any class of the King's subjects is excluded, either from the benefits of the reading-room or from any of the benefits of the collections,

John M. Mathew, Esq.

10 May 1836.

lections of natural history?—Certainly not; there is every kindness and attention paid to persons going there, unquestionably; but I should say that the hours are inconvenient.

3419. Have you any reason to believe that any person of decent dress and appearance, and apparently well conducted, would not be admitted to all the benefits of the reading-room, on producing the common testimonials, viz. that he is known to a housekeeper who is known to the librarian?—Certainly not.

3420. Is there any restriction whatever to the admission of any individual to see the collections, supposing always that he is a person in decent attire, and decently conducting himself?—I should say not. I have seen persons there, evidently, from their appearance, engaged in mechanical pursuits.

3421. Mr. *Hawes.*] Are you aware that it is open to the public only three days in the week?—I was not aware of that fact.

3422. Sir *Robert Inglis.*] The last question assumed a distinction between the public on the one hand, and certain portions of the public on the other. Are you aware of the fact that the British Museum is open in its reading-room for six days in the week to all persons whatever; that it is open in its collections of natural history and of art, to everybody for three days in the week; and that it is open in the same collections of natural history and art, to those who may desire to study therein for two of the remaining days?—I was not aware of the peculiar regulations as to the scientific department of the British Museum; and when I stated that I understood it was open daily, I was alluding to my own knowledge of the regulations in the reading-room.

3423. Mr. *Hawes.*] What is your opinion as to the value of such regulations to admit all persons, if entire classes are really excluded by particular regulations with respect to time; does it not, in point of fact, amount to an exclusion of whole classes?—I should say so. I stated before, that the hours during which the British Museum is now open, can only be available to men who go there for an express object, or to those who have the entire command of their time, and go there for amusement.

3424. If only on three days in the week the public generally is admitted to view the collections, and if on the other three days of the week only privileged persons can have admission, is not that another instance of exclusive regulations on the part of the Museum?—Certainly; I should say the regulations are exclusive, however undesignedly intended to be so, yet in their practical operation they may be considered as such.

3425. Sir *Robert Inglis.*] Are you aware that the privileged persons referred to in the preceding question, are artists engaged in drawing from the original works in the Elgin Gallery or in the Townley Gallery, or in the other depositories in the Museum on the one hand, or young naturalists, or men of science engaged in the pursuits connected with their own studies, in other parts of the Museum?—They are students, and it is an object to them; that class of people of course go from ten to four, because it is their regular occupation.

3426. Do you think that the artist could pursue his object in the British Museum if every one, not being an artist, were equally with himself admitted to the gallery at the same time?—I should instance the Louvre at Paris, as a practical proof that it may be so; you there see artists so employed, and whilst they are at their easels, perhaps 200 people will be walking about.

3427. In the answer which you have just given, are you speaking from your own observation as an English stranger, admitted by special application as a foreigner, upon the day when you may have happened to have visited the Louvre, or do you wish the Committee to understand it to be the general fact, that artists, and the world in general, are indiscriminately admitted on one and the same day in Paris?—I have seen artists take designs from the marbles, and have seen others copying the pictures in the gallery, on public days. I have witnessed this in the Louvre, many times.

3428. Mr. *Hawes.*] In France the public are admitted on Sundays?—Yes.

285

Mr. *John Cochran*, called in; and Examined.

3429. Mr. *Hawes.*] YOU are an extensive bookseller and dealer in manuscripts, residing in the Strand?—I am. Mr. *J. Cochran.*

3430. You have a large collection of manuscripts?—I have. 10 May 1836.

3431. And of course you are well acquainted with their commercial value?—I have had some experience.

3432. Do you think, generally, that the purchases made by the officers of the British Museum are advantageously made?—They have been made with great shrewdness and propriety in the instances that have come under my observation; but they have not, however, been so extensive as I think in some cases they ought.

3433. And made with great economy?—With great economy.

3434. Do you think no more economical mode could be suggested than that of the officers of the Museum going to bid at public sales?—I think sometimes they might do better in bidding by deputy.

3435. That is to say by employing a general agent rather than bidding themselves, it being known that they were buying for the national collection?—Yes.

3436. Have you heard the evidence that has been given to-day with reference to a classed catalogue of the manuscripts?—I heard Mr. Evans's evidence to that effect.

3437. What is your opinion as to the facility of making a classed catalogue of manuscripts, and the value of it when made?—I think decidedly there ought to be a classed catalogue of the manuscripts; that it would not be difficult to find proper assistants to make it; and that such a catalogue would be of very considerable utility to those engaged in literary researches when made.

3438. If it was published in the octavo size, in parts, according to the subjects, would it be a book likely to sell?—Every literary or scientific man in the country would probably avail himself of that portion of such catalogue as related to his own pursuits.

3439. What would be about the expense of printing an alphabetical catalogue of the printed books in the Museum?—I am not exactly aware to what extent it might run.

3440. Supposing it ran to 20 volumes octavo?—I should suppose it might cost from 350*l.* to 400*l.* a volume, the volume to consist of from 650 to 700 pages, and the number printed 2,000; I speak alone of the paper and printing.

3441. You assume that an alphabetical catalogue must necessarily be formed of such a library?—Assuredly.

3442. And being formed, that is your estimate of the expense of printing it?—Yes; but the expense must depend upon the number of copies printed. Some years ago I published a catalogue making a volume of about 800 pages, the paper and printing of which cost me about 400*l.*, and the number of copies printed was 750.

3443. Do you think a bookseller would be found to undertake the printing and publishing of such a catalogue provided it were formed to his hands?—I think there are booksellers who would run the risk of such a publication.

3444. Have you any catalogue of your own collection of printed books?—I have, as it existed in 1824.

3445. Is it a classed catalogue?—It is.

3446. What advantage do you find in a classed catalogue?—I find it of very great advantage; persons wishing to buy books in any particular class have then the means of referring to them altogether. I deal chiefly in theology; that class alone in my catalogue is sub-divided into others, such as "Fathers of the Church," "Liturgical Works," "Ecclesiastical History," "Polemical and Practical Writers," &c., and in the researches of clergymen and others I have found this classification of very great use.

3447. Is that catalogue bought at all by itself as an useful book?—I believe I may say that it is a book consulted occasionally to this hour, though it is 12 years since I made it.

Mr. *J. Cochran.*

10 May 1836.

3448. In fact it is now considered an useful catalogue of works upon particular subjects?—It is considered a very useful book of reference to this day; and being scarce, it usually sells at a price beyond that at which I published it.

3449. Your own collection of books is chiefly theological?—It is.

3450. Have you any opinion as to the library of the British Museum in this department of literature?—The British Museum contains a very good collection of theological books, at the same time I know that considerable deficiencies exist in that department, which, if a classed catalogue existed, I should be far more able, perhaps, to point out.

3451. Can you at all describe how you would set about forming an alphabetical and a classed catalogue for the Museum, if you were called upon to do it?—I would first catalogue the books in the order in which they are upon the shelves, making two copies of each title; I would then arrange one set of titles alphabetically, and at the same time place the other set in the classes to which they belonged, so that they could go on simultaneously. The only additional expense of classing the catalogue would be the second transcription of the titles.

3452. Can you give the Committee any idea of the expense of forming a catalogue in that way?—I can state what I have given myself for such work, and do pay at present, 2*s.* per hour.

3453. The number of volumes in the Museum is about 220,000; in what period do you think such a collection could be formed?—It would depend upon the number of hands employed; I think that if the country thought such a catalogue desirable, it could be done by having ample assistance certainly within five years.

3454. *Chairman.*] What do you consider to be ample assistance so as to accomplish it in five years?—I am not exactly prepared to state that, but it can be made a matter of exact calculation according to the number of articles that can be done per diem. Some persons will do more than others, and therefore it would depend a good deal upon the talents of the persons employed upon it. Supposing 100 articles were catalogued by one person per day, of course, if 10 persons were employed, 1,000 articles would be done. In naming 100 articles per diem, I speak of printed books; I am aware that it requires longer time to catalogue manuscripts than printed books, because manuscripts often require a minute investigation into their contents before proper titles can be given.

3455. Then, when you state that it might be accomplished in five years, you do not state that upon any previous calculation as to the force and power that would be necessary in order to accomplish it in five years?—Knowing the number of printed works in the Museum, and the number of articles that can by one person be done in a day, such a calculation might be made as would enable the country, by employing an adequate number of assistants, to command the catalogue in five years.

3456. Sir *Robert Inglis.*] You have referred to the rate of payment at which you have secured assistance in the preparation of your own catalogue; have you procured such assistance as has satisfied you upon that principle and scale of remuneration?—I have paid the sum stated for cataloguing manuscripts; I would not pay in the same proportion for cataloguing books, because I consider that to be a much easier task; but for cataloguing manuscripts I did obtain adequate assistance at that rate. I have recently engaged a person to catalogue some Oriental manuscripts, and I pay him 2*s.* 6*d.* per hour, few persons being qualified to catalogue or describe such manuscripts.

3457. *Chairman.*] You say that you have a classed catalogue yourself?—This is the classed catalogue of my books which I published in the year 1824—[*producing the same*].

3458. What course do you pursue to keep this catalogue in a sufficiently accurate and perfect state to answer the purposes of a classed catalogue of your books?—None in particular, as this catalogue still contains perhaps the best collection of theological books in any recent bookseller's catalogue; it is so full that in most cases it is an index to my stock even now.

3459. Your collection is daily varying?—Undoubtedly.

3460. Then what course do you pursue to keep it up as an accurate classed catalogue of your collection?—By re-supplying myself, as they are sold, with the most important works it contains; still, so far as my stock is concerned, it must in time become obsolete; this observation cannot apply to a public library, the contents of which are of course permanent. I am now preparing another catalogue, which will be a better one than that now produced; when it appears it will supersede

sede the other. Here is a catalogue of manuscripts which I have now in the press —[*producing the same*]; it is classed very minutely.

3461. Mr. *Hawes.*] Have you ever purchased any duplicates sold by the British Museum?—Of printed books I have, frequently.

3462. Do you think the books sold as duplicates have been judiciously parted with?—Certainly not formerly.

3463. To what time do you refer?—I should say that, to my own knowledge, within the last eight or ten years they have been much more careful in the sales of duplicates as to what copies and what articles they threw out; but formerly it appeared to have been done without care, and without any proper knowledge almost, because articles of extreme interest, possessing sometimes important manuscript notes, have been sold amongst the duplicates of the Museum, and copies belonging to particular collections, such as the library of James the First, or of Charles the First, interesting from such circumstances, were thrown out, which no officers of the Museum would now think of parting with. I have had some very interesting ones of that kind in my own possession.

3464. Was there not once rather a celebrated book sold, written by Henry the Eighth against Luther, and supposed to have been a presentation copy from that King to Archbishop Cranmer, with Cranmer's manuscript notes in it?—I have bought that book myself by auction three times.

3465. And which was originally in the library of the British Museum?—Undoubtedly, because it had the mark of having been a duplicate, and had been parted with as such. On the book is stamped the date when it was originally sold; and this instance illustrates my observation as to the carelessness with which duplicates were thrown out formerly.

3466. Sir *Robert Inglis.*] As you say that copy has been sold three times, do you wish the Committee to understand that it was not excluded at any recent period from the Museum?—Certainly not; but I would have thought it very desirable for the Museum, at one of these sales, to have secured it again, and to have replaced it in the collection from whence it had been taken.

3467. Mr. *Hawes.*] Do you remember Luther's copy of his German translation of the Bible of the date of 1541, being sold?—Yes.

3468. What is the commercial value of that book apart from the autographs in it?—It is hard to say; it is a fancy book; unquestionably it is not the latest edition of Luther's version edited by himself, which was printed in the year 1545; I should suppose, however, it might be worth 10 or 15 guineas, if in fine condition.

3469. Do you remember the sum at which it was sold?—Yes, I do; I was the last bidder for it, except the Museum, it sold for 255 guineas.

3470. Then its chief value was to be found in its containing the autograph of Luther?—Not Luther's alone; it contained several other autographs of Protestant reformers; its chief value arose from the kind of history attached to it, it having, as was said belonged successively to these several reformers. There were the autographs of Luther, Melancthon, Œcolampadius, Bugenhagen, &c.

3471. Sir *Robert Inglis.*] The copy of which you are speaking was formerly in the possession of Mr. George Hibbert?—It was, and before that in the possession of the late Mr. Edwards, the bookseller.

3472. Mr. *Hawes.*] Have you ever met with a curious Bible with Cranmer's autograph in it, which was sold from the Museum?—I once saw such a book in the house of Messrs. Payne and Foss, but I know nothing as to how or when it was parted with.

3473. Had it the duplicate stamp of the Museum upon it?—I do not remember that, but I remember seeing the autograph of Cranmer upon its title page.

3474. Was there not another copy of the same book you have just mentioned, namely, Luther's German translation of the Bible, 1541, recently sold for a much less sum?—Yes.

3475. What constituted the difference in value?—The autographs in the latter copy were accidentally overlooked in the catalogue when the book was sold, and some of the autographs themselves had been partially erased; it sold for the sum of 1*l.* 7*s.* It was subsequently offered to me for 30 guineas by the party who bought it, and I tendered it at 35 guineas to the gentleman for whom I bid 250 guineas for Mr. Hibbert's copy in the previous year, but he declined it; it was subsequently sold to the Bodleian Library at Oxford, for 50 guineas.

3476. You are aware that the British Museum prints various works?—I am.

3477. What do you think of the expediency of an institution like that turning publishers?—

Mr. *J. Cochran.*

10 May 1836.

publishers?—With regard to the description of particular collections in the Museum such as the Elgin marbles, the Townley collection of antiques, the minerals, insects, coins, prints, &c., I think the Museum might, advantageously to the public, in a cheap form, publish descriptions of these collections; in such a form they would be highly useful to artists engaged in scientific pursuits, and other persons. If such synopsis of the contents of the Museum existed, printed neatly at a very moderate expense, they could but be highly beneficial and advantageous to the country, and make the contents of the Museum more extensively useful.

3478. You know the Gallery of Antiquities in the Museum, which is rather a large and expensive publication?—I do.

3479. Do you think the publication of that work is managed well, being published as it is at long intervals and at great expense?—It is certainly very expensive; but as a work of luxury for the upper classes of society, perhaps it is more desirable to see it in its present form; but with a view to promote generally amongst the people a taste for the fine arts, and also for the benefit of artists, it is less useful than if it were in a cheaper and yet sufficiently handsome form.

3480. Sir *Robert Inglis.*] As a work of art, is it in your judgment superior to any work of the Dilletanti Society, or to any work in any collection, British or Continental, that you know, looking at the style of the engravings?—I should say that it is equal to the publications of the Dilletanti Society, and superior to most foreign works of the kind that I know.

3481. Mr. *Hawes.*] Do you not consider it desirable that it should be published at [illegible]lar intervals, with a view to secure even a moderate sale for the work?—No[illegible]bt it would be better that the public should know at what intervals to expec[illegible]e work, it would also tend considerably to promote its sale; I can speak, how[illegible]r, better with reference to the book department in the Museum than with rega[illegible]o the other departments, and I am sure it would be very desirable to every one [illegible]nected with literary pursuits, to have a classed catalogue of the extensive and valuable collection of printed books and manuscripts contained in the British Museum.

3482. Mr. *Hawes.*] Have you any general suggestions to make with reference to the management of the library of the Museum?—I have nothing to say as to its management; the officers in the book department, to whom I have had occasion to mention works that were deficient, if they thought them of sufficient consequence to be in the Museum, have generally purchased them, and much more so recently than formerly. I have been told repeatedly by Mr. Baber, some years back, that the fund for purchasing books was very limited, but it has recently been enlarged, and I have always found the greatest readiness on the part of the librarians to listen to any suggestions of desiderata in the library, and as to their being supplied if the funds at the time permitted it.

3483. *Chairman.*] The work that you have now produced, being the commencement of your new catalogue of manuscripts, is not royal octavo?—It is not; it is demy octavo.

3484. Do you consider the demy octavo a sufficient size to use in printing a catalogue of manuscripts?—I do.

3485. Would the expense of an edition of a catalogue printed on royal octavo be considerably more than if it was printed on demy octavo?—It would be more for this reason, that the paper and printing would necessarily cost more; but as more matter would be got into the page, it could be, therefore, but little more expensive if the royal octavo size is thought better for the purpose. Where facsimiles or specimens of particular manuscripts are given, the royal octavo size is sometimes the most desirable.

289

Jovis, 12° *die Maii*, 1836.

MEMBERS PRESENT.

Mr. T. G. B. Estcourt.	Sir Robert Inglis.
Mr. Hawes.	Mr. Compton.
Sir Philip Egerton.	Mr. R. Colborne.
Mr. Baring.	Mr. Thornely.

MR. T. G. B. ESTCOURT, IN THE CHAIR.

Olinthus Gregory, Esq., LL.D., F.R.A.S., called in; and Examined.

Olinthus Gregory, Esq., LL.D., F.R.A.S.

12 May 1836.

3486. Mr. *Hawes.*] YOU are Professor of Mathematics in the Royal Military Academy at Woolwich?—I am.

3487. And one of the board of visitors of the Royal Observatory?—Yes.

3488. Are you at all acquainted with the constitution and general administration of the British Museum?—Not very intimately. I have attended to it in some measure, especially in consequence of seeing the report of the Committee of the last year.

3489. Are you acquainted with the evidence which was delivered last year before the Committee to inquire into the affairs of the British Museum?—I have read it, but not very attentively, as my own occupations are very heavy; my attention has not been drawn to the subject above two or three weeks; of course I turned to it with very much interest.

3490. From the acquaintance you have had with the Museum, should you consider that it is in such a state as to satisfy scientific men and the wants of the public?—I should think not at all.

3491. With reference to the library, what opinion should you be disposed to give?—I should think the library, if it does not contain more than 220,000 books, must be altogether inadequate to meet the wishes and desires and reasonable expectations of literary men or inquiring men in this metropolis.

3492. Do you think it is possible for the public, or even for the Trustees, to know accurately the contents of the library unless they have catalogues, both alphabetical and classed?—I think it is essential, both to the institution and to the convenience of the public, that there should be well-arranged catalogues, and farther, that a catalogue should be immediately undertaken for the purpose of ascertaining precisely what books there now are. This seems quite necessary in order to prepare the way for such an augmentation of the library as may be deemed expedient.

3493. In order to purchase judiciously you think it is absolutely necessary to have a good classed catalogue of the library?—I think quite so.

3494. And equally so in order to facilitate the researches of learned men and the public in general?—Doubtless.

3495. Are you acquainted with the plan of classification adopted in the library at Petersburgh?—Only from the account, which is a very admirable one, in the last report. I have only read it cursorily, yet so as to say, that though it is perhaps a little too minute, it would furnish very valuable hints.

3496. Have you any opinions which you have matured upon the subject of the classification of the library with which you can furnish the Committee?—I have several hints before me; I think I should not be right in saying they are matured, because I have so recently brought my mind to the subject, but it is possible that the hints may be of some little value, and I shall be happy to make them known to the Committee if it is thought right.

3497. Will you have the goodness to state them?—I would first present simply a kind of outline of the divisions into which I think a library might be very well arranged; but in order to make it of any value, or adequate to the

Olinthus Gregory, Esq., LL.D., F.R.A.S.

12 May 1836.

demands and reasonable expectations of the public, I should say that the books, instead of being 220,000, as I understand them to be, ought to be at least 600,000. The king's library at Paris contains about 650,000; and I remember being informed that at Munich, with a population not equal to our Birmingham, there is a library of about 250,000 volumes; and therefore to have such a library as would be worthy of a British Museum, and at all meet the wishes either of scientific men in any department of science or any class of literary men, I should say that it must be at least so extensive as to contain 600,000 printed volumes, and in that case I conceive it should be in at least six divisions. I would however say here, that it would be very possible that in the arrangement of a library deviations from a strictly logical plan would occasionally be required on practical considerations, and that even the character of the majority of the books now in the library might tend to modify any arrangement that might be attempted. But I would first present this as a hasty outline. A library in six divisions might be thus constituted:—First, Intellectual Sciences, in six sections; secondly, Natural Sciences, in several sections, 10 or 12 or more; thirdly, the Exact Sciences, pure, mixed, and applied. The fourth I think might be devoted to the Fine Arts, and useful arts and manufactures, in two sections at least; and the fifth I think should be devoted to History, Biography, and Chronology, and there would be several sections which could be easily defined. The sixth to General Literature, languages, bibliography, belles lettres, &c., of course including grammars, lexicons, classics, poetry, &c., voyages and travels, periodical and miscellaneous literature, of various kinds and of different countries; these also could be readily specified for arrangment. Such a division at least as this would, in my judgment, be quite necessary in order to constitute such a library as any man devoted to literature or science, or indeed any well-informed man of inquiry, would expect to find in the British Museum.

3498. Do you think there are any great practical difficulties in the way of accomplishing such a division of the library?—I should think not at all, taking for granted that the pecuniary requisites can be met; no difficulty I mean but what can be readily surmounted, if men of adequate information and practical habits in different departments were employed.

3499. Have you any idea of the pecuniary cost of such a classification?—I have not; my attention has not been directed to that point.

3500. Do you think it likely that it would be so costly a work as to prevent its being accomplished?—I should say not at all.

3501. You think there is nothing to prevent the division of the library according to your plan, nor the publication of a classed catalogue corresponding with such divisions?—I should conceive not at all; I think I should find no difficulty myself in suggesting a plan which would accomplish the whole.

3502. Have you visited the library of the Museum lately?—Not within the last twelvemonth or so; I have never so visited it as to become intimately acquainted with it.

3503. Sir *Robert Inglis*.] The answers which you have given have had reference rather to the volume of evidence printed by order of the House upon this subject last year, than to the results of your own knowledge, observation and experience in the matter?—Yes; the only fact upon which I have grounded all my thoughts upon the subject of the library, has been the simple fact that it contains only 220,000 volumes.

3504. And you conceive that such an amount, admitting for the moment that that is the amount, is inadequate to meet the wants of any one class of the people who may consult it?—I cannot but think altogether.

3505. Do you know the extent of the collections in the British Museum, in any one department?—No; I have merely visited them in a very cursory manner at different times, but never so as to acquaint myself with what is actually there; nor should I regard myself as competent to give a decided opinion in any other way than as to the proper basis of a general arrangement, and what I think the library should contain.

3506. Then, without knowing what may be the contents of the Museum in any one department, you say that the aggregate number of books, assumed to be 220,000, is itself an evidence of the general imperfection which you would desire to see remedied?—Earnestly, with reference to the books.

3507. Mr. *Hawes*.] With regard to the number of volumes, the fact, stated to

to be assumed, you found upon the authority of the officers of the Museum in the last year's Report?—Yes.

3508. Will you have the goodness to look at the Parliamentary return now shown to you, and state what is the number there stated to be in the library?—The number in 1821 was 115,925; that I presume was before the King's library was removed, and then the addition of the other, with some purchases, makes 218,957.

3509. Speaking of a library of that extent, you have no hesitation in coming to the conclusion that there are no practical difficulties in the way of classifying and arranging it according to your plan?—I should think none at all.

3510. The addition of 20,000 volumes would not make any alteration in your opinion, would it?—None the slightest.

3511. Do you think that the space in which the present library is accommodated has been economised in the Museum?—I should think not; though perhaps I ought to say that though I have been two or three times in the library, I have spent much more of that time in very interesting conversation with one of the functionaries, than I have in examining the arrangement of the books; but I have had a feeling that it was inadequate to meet even the views that I should have in going there.

3512. Do you think the space which has been employed in accommodating the library has been economised?—No; not at all.

3513. Do you think that the space in which the King's library is placed, and in which there are about 70,000 volumes, has been economised, or do not you think that a much greater number of books might be accommodated in the same space with good arrangement, the size of the room being 370 feet by 40?—I should think that a room of that size might hold more than 200,000 volumes.

3514. Sir *Robert Inglis.*] In the answer which you have now given, do you refer to any other room in which 200,000 volumes are contained, or do you give that answer upon a general impression that you could contrive to place the number of books which you have stated—in the dimensions of 300 feet by 40?—I attempted an estimate for six divisions, each containing 100,000, and my idea was that with a proper arrangement 100,000 books might be contained, or nearly 100,000 in a library of 100 feet long and 50 wide, with adequate height.

3515. Does that answer imply the filling up of the intermediate space, as in the manner of the Bodleian library, and some old libraries in colleges, or does it merely imply the ordinary arrangement of shelves along the walls?—It does not imply the latter at all; I should avoid as much as possible bringing the books, except perhaps the smallest, into contact with the walls.

3516. Will you state your abstract views of the mode of arranging a library, so as to include 100,000 volumes in a space of 100 feet by 50 broad?—I have prepared a paper, which, with the permission of the Committee, I will deliver in, containing an explanation of my views upon the subject.

[*The same was delivered in and read, as follows:*]

The annexed plan and section will serve to elucidate my notion of the arrangement of library apartments *en suite*, while they will help to render intelligible my suggestions as to the manner of arranging each apartment, for the reception of 100,000 volumes.

Length of each apartment, 100 feet, breadth 50, height 40, height of book-shelf frames 28 feet clear.

The light admitted partly * from sky-lights, L, L, &c., and partly from windows pointed, as W, W, transverse section.

S, S, S, S, in the plan, show the position of the *double* book-shelves, arranged all round each apartment, except at the space for doors, &c. as marked. These shelves, *not* proposed to be in contact with the walls, but at least *five* feet from them. The shelves, moreover, to receive double rows of books, so arranged (backs outwards) that there shall be access to them (*by the attendants only*) both on the side next to the visitors and the side next to the wall. The back and front tiers of books should be separated by a light brass or other metallic net-work; and there should be facilities for occasional ventilations, or the application of such scents as are known to preserve books. The frames for the reception of the books being 28 feet high, light iron galleries, marked g, g, &c. in the transverse section,

* This is not meant to preclude the introduction of other windows lower down in the wall, but to supply the principal light from above, shooting across nearly at an angle of 45°.

Olinthus Gregory, Esq., LL.D., F.R.A.S.

12 May 1836.

section, should run all round, that the attendants may have the more ready access to the books.

D, D, D, &c. mark the places of desks for visitors . . . A, A, A, &c. accommodations for the attendants.

A′, A′, A′, &c. others for occasional use.

The broken lines — . . . — . . . —, marked, *f*, *f*, *f*, &c., which run round between the visitors' desks and the shelves, indicate a light wire or other fence, with a few light gates, to be open and shut only by the attendants, — for the purpose of preserving the books, and keeping all from access, except such as might receive occasional permission from the Directors.

Octavos require 100 square feet for 800 volumes, and therefore 12,500 feet of surface for 100,000 octavo volumes. The proposed arrangement would yield 12,768 feet of surface.

$$[(82\times4)+(32\times4)]\ 28 = 456\times28 = 12{,}768 \text{ square feet.}^*$$

If in any division of the library, folios and quartos should so preponderate that the average space could not be taken upon octavos; then let compartments 6 feet 9 inches high, and 6 inches deep, be placed in *contact with the walls* for the reception of *duodecimos et inf.*

30 square feet will well receive 360 duodecimos; and therefore shelves 6 feet 9 inches high, all round each apartment, would receive 22,700 duodecimo volumes.

Note.—If the gallery that leads to the several apartments, or divisions, be 12 or 14 feet wide, and 10 feet high, the space above it (30 feet) may either be subdivided into apartments for different minor attendants, or be made into a well-lighted gallery for zoological specimens, works of art, or antiquities.

3517. Sir *Robert Inglis.*] Do you know anything of the proportion which the folios and quartos bear to the octavos and duodecimos in the King's library, as to the superficial feet covered by each?—No.

3518. Do you know the proportion which they bear in any other great public library either in England or on the Continent?—No; I have not observed accurately.

3519. On what grounds do you assume the octavo to be the medium size in the collections of any great public library?—I have not observed in any great public library how far there is a preponderance of folios and quartos; and therefore, feeling there might be some doubt about it, I endeavoured to provide for any deficiency of room growing out of a preponderance of folios and quartos, which applies principally to the older, by disposing of 12 mos. and smaller books, as I should in my own library; that is, by putting them in a measure out of sight; and therefore I have, in the plan given in, provided additional compartments for the reception of the duodecimos; and such a measure, I think, would bring back the the average to octavos. But, doubtless, to form any tolerable estimate of what could be done in such a case, it would be necessary, as I have already suggested, to have a correct list prepared of the books now in the library, as well as of their kinds and sizes.

3520. For the purposes of the present inquiry you would desire to have not merely an alphabetical catalogue or a classed catalogue, but a list of the sizes of the volumes in folio, in quarto, in octavo, and in duodecimo?—If I were required to make a correct estimate, I should endeavour to make such estimate, not merely for the purpose of ascertaining what the size of the library should be, but what are the books actually in it, that I might apply the information gained to other purposes at the same time.

3521. Necessarily you would require to know first of all what is the area occupied by the folios, for instance, before you could provide accommodation on the walls for the 600,000 volumes?—Yes, if that were the main object; but if my object were simply to say, I conceive that upon the average 100,000 volumes can be got into a room of such a size, and I felt also that before the precise mode would be determined upon, it would be necessary to know how many books, and of what kinds they were, I should rather propose a plan which should ascertain the two facts at once, before I proceeded beyond a mere average guess as to what would be the case. That average guess has done something, if it be no more than this; that it has led me to think that a room as large as that which now contains the King's library, might, if it were suitably arranged, receive a great many more books.

3522. Mr.

* If the height of the tiers of shelves were only three-fourths of this, then each apartment must be lengthened one-fourth.

3522. Mr. *Hawes.*] Should you think it a good and wise mode of building extensively for the accommodation of a public library without consulting literary men or librarians as to the space to be required, or as to the arrangement to be made?—Certainly not. I should regard that as essential to setting about the inquiries properly.

3523. If, therefore, the architect should not have previously consulted the librarians, do you think it is likely that the best and wisest economy of space can be adopted?—I should think the probabilities were very much against it.

3524. Sir *Robert Inglis.*] The last question has assumed as a fact that the architect has not, directly or indirectly, been put in communication with the officers of the respective departments, and particularly with the officers in charge of the printed book department, which forms the subject of the present examination. Have you any information which you can state to the Committee as to whether the fact be, or be not, so?—No; I have no information whatever about it. I simply answer the question as proposed.

3525. You have referred to the volume of evidence printed by the order of the House of Commons upon the subject of the British Museum last year; do you in that volume find any evidence upon this point?—No; I have not found any such evidence, nor have I looked for it, for that point did not come to my mind with interest.

3526. Mr. *Hawes.*] You have seen the zoological collection in the Museum?—Not to examine it with any attention.

3527. Should you conceive it possible that such collection could be well and economically accommodated without the architect coming into close communication with the officers of the Museum, so as to ascertain beforehand what space and what arrangements were necessary for the exhibition?—Unless the architect knew a great deal more of zoology than I do, I am sure such an omission would be highly inexpedient.

3528. Sir *Robert Inglis.*] From the volume to which you have already referred, can you state to the Committee that, directly or indirectly, the architect has not been in communication with the officers in charge of the different divisions of the zoological department?—No; my thoughts have not been drawn at all to the question.

3529. Mr. *Hawes.*] In the evidence given before the Committee last year, when the question was put whether Mr. Children, who is one of the officers in the zoological department, had received any written communication from the secretary, or had seen the plans by Sir Robert Smirke before they were adopted, his answer was, that he had seen the plans of Sir Robert Smirke in the Secretary's hands, but was not consulted by the trustees nor by the architect as to any suggestions for the arrangement of the zoological collection; do you think that shows discretion on the part either of trustees, officers or architects?—May I be allowed to say, that though my mind is very decided upon it, I feel some hesitation as to answering the question.

3530. In another portion of the evidence given by Mr. König, who is the head of the geological department, it is stated in answer to a question to this effect "Then at present you have not light which will enable you to measure the angles of a chrystal?" Answer, "No." To the next question "Have you ever made representations to that effect to the Trustees, or to the architect, or to your brother officers?" the answer is "I have reported both the want of ventilation and of light, but I suppose the Trustees are not able to remedy the evil." Do you think that shows that attention to the necessary duties of Trustees, directing a great national institution, which might be expected from their high name and character?—I should say the same with respect to this as with respect to the preceding question.

3531. Sir *Robert Inglis.*] The answers which you have now given assume, as the questions put to you assume, the accuracy of the statements contained in the quotations which have been read?—Yes.

3532. Mr. *Hawes.*] Do you know the hours of admission to the library?—I think they are from ten to four on certain days.

3533. Would you extend those hours of admission?—I should think very much.

3534. Both in the morning and in the evening?—Both.

3535. Do you at all object to opening the reading-room in the evening?—I have not a decided opinion about it; I should see no objection myself to the

Olinthus Gregory, Esq., LL.D., F.R.A.S.

12 May 1836.

reading-room being opened in the evening, provided the room was made fire-proof; but I should hope that amongst the improvements that would be introduced into the Museum would be such as would make every room in the library a reading-room.

3536. Provided of course the rooms were all fire-proof?—I did not contemplate how that might be; but my idea was, that supposing some such divisions as I have been speaking of were adopted, and from 40 to 50 or 60, or it might be more individuals, were admitted into those rooms from as early a time in the morning as it might be light enough for reading, till that time in the evening when lamp-light should be required, and they were distributed through the rooms, there would be much less occasion for a reading-room than now. I do not mean to say that it should preclude it altogether.

3537. *Chairman.*] You suggested that it would be a good alteration to open a reading-room in the evening?—One room. If all the rooms are made reading-rooms I should not propose it; but if there were only one room, I should think it desirable that it should be so.

3538. In that regulation, do you contemplate the keeping open the whole body of the library, so that the readers who are there in the evening may procure books from all parts of the library, or do you think that an arrangement should be made that the books to be perused in these evening hours should be brought from the body of the library into the reading-room prior to the lights being required?—If it were thought right to have a separate reading-room, I should say that the books for the readers who should assemble in the room for evening reading should be asked for the day before or so, in order that they might be there ready for use. There is a something in that question which I think would go a little further than that, at least in my contemplation of the matter. My idea would be to have the library separated, made into six or seven divisions, and as many apartments, and the readers whose attention would be drawn to one of the classes of subjects to be found in those respective divisions would go into that one room and not want to go anywhere else; and they might be admitted at an early hour. At certain seasons of the year, I see no objection to their going in at six in the morning and continuing till eight in the evening: that is, that each of the six or seven rooms should be open to readers for that time: of course there must be such arrangements made as to the attendants that would make the pressure of labour not unreasonable. But if arrangements of that kind were so made that the hours in which the Museum should be open were regulated by the length of daylight reading, and that the individuals should be admitted into the apartments in those respective divisions, then the necessity for full attendance in an evening reading-room would be very much diminished (I do not say that it would be altogether done away with), and then the risk that might arise from having an evening reading-room would be diminished also.

3539. Would you at no part of the year keep the reading-room open except during the hours of daylight?—If ample security from risk by fire could be provided, I should say keep them open; but if men of adequate knowledge, as architects and persons who heat and ventilate rooms, should say that there would be risk, then I think such an idea as I have in part suggested would in a great measure diminish the disadvantages that would arise from persons being precluded going into those rooms for reading by lamp-light.

3540. Supposing perfect security against fire to be obtained, at what hour in the morning would you have the library opened, and to what hour in the evening would you keep it open?—I should still have it open in the summer time at six o'clock; in other seasons varying according to the modifications of daylight; and in the evening I should recommend that all the rooms should be kept open till nine o'clock. There are hundreds of men in this metropolis who are anxious to obtain information, who are altogether precluded by such an arrangement as that which now exists; they never can enter the Museum.

3541. Sir *Robert Inglis.*] Do you know any institution in this or any other country in which an access so large as that which you have pointed out as desirable is given?—No, I do not; but I should like, if there be a change in the British Museum, that other countries should be set an example.

3542. Do you know an instance in this country, in any library supported by subscription of its own members, in which such accommodation as that which you now state to be desirable is asked and obtained by members for their own use?

use?—The library belonging to the Royal Artillery at Woolwich, which is a library supported by their own contributions, is open every evening till nine o'clock, and I am not sure whether it is not until ten.

3543. Is it open at six o'clock in the morning?—I think not.

3544. Is that a library to which the world at large have access?—No.

3545. Is not it rather in the nature of a library belonging to a large family, to which the members of that family only have access?—It is open to some hundreds of individuals.

3546. Are they all of the same corps?—They are of two corps; but that instance suggests something to me in reference to a question which was put as to the supposed danger of having lights in the evening. There no danger has resulted, although servants have access to the library when they go to exchange their masters' books. There are two rooms open constantly every evening, and I believe more than five-sixths of the year they have lamp-light.

3547. What is the extent of the library?—It is a small library; 10,000 or 12,000 books.

3548. Mr. *Hawes.*] Do you know the library of the London Institution?—Yes.

3549. That is open of an evening, is it not?—I should think so.

3550. Have you heard of any inconvenient consequences resulting from that?—None whatever.

3551. Do you apprehend any such inconveniences as to justify a denial to the public of the use of the National library in the evening?—I cannot say that I anticipate any evil that would result, provided those precautions which I have alluded to were taken.

3552. Sir *Philip Egerton.*] What security would you have for the books contained in each of the separate rooms, even although the room itself should be fire-proof, if they were open by artificial light?—I should not wish to be understood as very especially urging lamp-light or candle-light: supposing an arrangement could be made that should receive from 300 to 400 persons the whole day, it is only upon the supposition that you can have but one reading-room, and that a very small room, that I would strongly urge lamp-light.

3553. Mr. *Hawes.*] Supposing the present reading-room to continue with its regulations as it is, do you think there would be any inconvenience in extending the hours of admission till nine o'clock in the evening?—I do not.

3554. Sir *Philip Egerton.*] What arrangements would you make, supposing the reading-room to be open from six o'clock in the morning till eight in the evening, for cleansing the apartments?—The daily cleansing might be done without much difficulty before six o'clock in summer; and as to any more entire and complete cleansing, I think first one division and then another should be closed for a week or ten days, or whatever time might be required, and that at least a fortnight's notice should be given to the readers that such apartment would be shut at such a time and for such a time; and when the room of any one division was thus closed, I would not have the room of another division closed.

3555. But supposing the hours of admission to be regulated by the hours of daylight, it would entail the necessity of the operation of daily cleansing being performed by artificial light?—Yes, sometimes perhaps.

3556. Then what security would you have against the carelessness of the housemaid or other accident?—I do not know that I can suggest any other modes than what are made use of in various similar cases. I have no doubt that various plans might be easily adopted that would prevent all risk in this partial cleansing.

3557. Mr. *Hawes.*] Do you take any very special securities in your own library against your own housemaids?—No.

3558. Mr. *Compton.*] Supposing your plan of opening six separate rooms were adopted, how many attendants do you think would be required, supposing they were open from six in the morning till eight at night?—That would be a matter of detail that would be easily arranged. I think the attendants that took the duty in the morning should be relieved at one o'clock for instance.

3559. Would not a greater number be required for the security of the books?—I think that about four regularly attending, supposing there are 60 readers admitted, would be sufficient to take care of the books, the readers having no access to the books.

Olinthus Gregory, Esq., LL.D., F.R.A.S.

12 May 1836.

3560. Sir *Robert Inglis.*] In all the answers which you have given you have stated your opinion on abstract grounds, and not upon observation of the results in any other public institution?—No, for this reason, that mine is altogether a scheme, growing out of what I suppose to be the exigencies of the Museum.

3561. Mr. *Hawes.*] Are you acquainted with the nature of the governing body of the British Museum?—I have noticed it in the report.

3562. It consists of official men and high public functionaries, and men of very distinguished rank; do you think that the description of governing body most desirable for such an institution as the British Museum?—When I say I should think it not the most desirable, I am sure it will not be supposed that I mean to imply any blame upon a single individual of the trust.

3563. Do you think the admission of scientific men to share in the government desirable or not?—Very desirable, as well as some of the functionaries that are or should be appointed librarians and curators, and so on.

3564. Would you admit some of the officers to a share in the general government of the institution?—Doubtless.

3565. Supposing a plan should be proposed something to this effect, that the Trustees should consist of individuals elected by certain learned societies, that in them should be vested the absolute appointment of the principal officers of the Museum, and that the officers in their turn should form a board for the executive government of the Museum; do you think such a plan would be likely to work well?—I should be a little afraid about it.

3566. Will you state to what part of it you object?—My objection would be of this kind; that most learned societies are too much under the influence of coteries for me to have full confidence in the various elections that might thus be made.

3567. You object to the selection being placed in the hands of learned societies; you do not object to learned men being elected Trustees?—No; I think it would be very desirable if it were only to excite an interest in learned men in the prosperity of the institution.

3568. In whose hands would you place the appointment?—I scarcely know how to answer that.

3569. Is it that you have not sufficiently considered the subject, or do you feel any delicacy in the question?—It is that I do not precisely know how to separate the answer to that specific question from the general view of the manner in which the government of the institution should be constituted.

3570. Do you see any objection to placing in the hands of one of the Ministers of the day the appointment of the Trustees, requiring it only as a condition that a certain portion of the Trustees should be drawn from scientific bodies, or from amongst the ranks of scientific men?—I think I should. My objection there would lie very much in the same direction as the objection to the present constitution of the Trustees. Several of the Ministers of the day, if they had nothing to do but to attend to the concerns of the British Museum, would, I have no doubt, manage it well; but they have so much upon their thoughts of so much more importance, that a divided attention would, I fear, compel them, of necessity, to leave such appointment in other hands.

3571. Then, in point of fact, do you think it desirable that there should be some one superintending officer, some man of eminent literary rank, in whom should be vested the appointment of Trustees?—No, I should not quite think so; but permit me to say, that my views upon the subject are more intended as suggestions for consideration than anything else.

3572. Mr. *Baring.*] Will you have the goodness to state your views?—My views would require also a very considerable augmentation of departments and officers. I think, for example, that there should either be a librarian and an assistant-librarian, or two joint librarians for each division of the library; and that there should be from 14 to 15 curators and assistant-curators for the different departments of zoology, mineralogy, conchology, and so on, into which the general purposes of the Museum should be divided. Then my view would be, that it might be well for those to elect annually or once in three years, from amongst themselves, subject to the ratification of the Trustees, a Director-in-chief of the institution. I should say, of course, the new appointments should be filled by men of reputation, if not of eminence, in their respective departments.

3573. Have you anything further to suggest upon this part of the subject?—I would

Olinthus Gregory, Esq., LL.D., F.R.A.S.

12 May 1836.

I would farther suggest whether it would not be desirable that some of the subordinate appointments in each department and division of the Museum and library should be occupied by well-instructed and intelligent young men, whose thirst for knowledge might be kept alive by what they see around them, and who might thus receive an admirable training for the higher and more responsible posts; and would it not be well for from four to six of the higher officers, curators, librarians, &c., to be elected as associate trustees or governors, one of them retiring from that appointment every year, or two of them every two years, and for the same number, from four to six, to be chosen by the present Trustees from among themselves, and retire periodically in the same manner; and that these two sets of associate trustees constitute together a superintending council, to receive reports and suggestions from the curators, librarians and others periodically, and decide what measures shall be adopted accordingly; such measures, if reaching beyond the ordinary routine to be referred for ratification to the entire body of Trustees, the said council or committee of management and reference constituting a part of that body, and convened with them on such occasions. And in any case of momentous difference I would suggest that the minority should possess the power of appealing to the Secretary of State for the Home Department for final decision; or perhaps of previously calling in a properly constituted independent board of visitors, men of eminence in the various branches of literature and science, and of enlarged views, of high honour and probity. Such a plan as this taken at large, besides producing other beneficial effects, would interest a number of talented men in different departments of knowledge who are now altogether indifferent as to the utility or prosperity of this National institution.

3574. In making appointments to the several situations in the Museum, would your object be to encourage literary men of merit, or to look solely to the advantage of the institution itself, considering the encouragement of merit as merely a collateral and incidental advantage?—I should think the two would be very intimately blended.

3575. But which would be the main dominant object which would guide you in the appointment?—The first object, of course, would be with me, if it were my business to attempt to remodel the Museum, to attend to the interests of the institution itself; but I should next feel an entire persuasion that if I could bring men of science, men of talent, and men of general information, forward in such a way that their opinion should be occasionally taken, and their responsibility involved, I should, by so interesting them, promote knowledge and science, and therefore very much promote the general purposes of the British Museum.

3576. You would consider the preservation of the Museum, and its being kept up in that state which is most advantageous for the public, as the first object, and the encouragement to literary men as a second and incidental one?—Altogether incidental, except in so far as frequent admission to the appointments in the Museum would be a high encouragement to literary men, to men who pursue or promote knowledge.

3577. But you do not mean to intimate an opinion that the Government of the country should not encourage literary men by any other means in their power?—No; my opinion with regard to elèves being trained up for the department would be simply this, that a number of intelligent young men would be trained and fitted for the discharge of the duties of the various departments of the institution better by being brought into it early than in any other way.

3578. Do you think a person actively engaged in scientific pursuits, and especially in extending the limits of knowledge, would be a fit person to be appointed as curator over any one of the departments, or should you say that a person of inferior pretensions would be better suited to that office?—Speaking so far as my own knowledge goes, with one splendid exception perhaps, namely, that of Sir John Herschel, I should say that usually a man very deeply absorbed in science would not be the fittest man to undertake the management of any department of the institution. I make an exception with respect to Sir John Herschel, because there is nothing that he would see it right to undertake, whether it be a matter of theory or of practice, that he would not execute with judgment, taste, activity, and the most comprehensive views.

3579. Sir *Robert Inglis*.] Do you know enough of the actual state of the

Olinthus Gregory, Esq., LL.D., F.R.A.S.

12 May 1836.

British Museum, with respect to the employment of young men, to state how far your general views are, or are not, supported by the existing system?—No; I know so little of the actual detail of the British Museum, that I should not be competent to answer as to that.

3580. You do not know how many young men are at this moment employed?—No; I have not the pleasure of knowing more than two or three of the present functionaries of the Museum, for all of whom I have a very high respect.

3581. Do you know any foreign libraries?—The only foreign library I know is that of Paris.

3582. Do you know in what state their catalogue is?—No, I do not know at all.

3583. Or whether there be a catalogue?—No; when I went over the library there I found the facilities so great for all the information I required, that I had no occasion to refer to a catalogue.

3584. You mean facilities from the living catalogue, Mr. Van Prat?—The principal person to whom I applied was Abel Remusat, who is now dead. The moment I went to him, or so soon as he ascertained the bent of my inquiries, he appointed two or three young men. He said tell me what department of the library you wish especially to examine, and these shall go with you; everything you wish shall be shown to you; and I was exceedingly delighted with the demeanour and intelligence of those young men.

3585. Do you know the hours at which the Paris library is open, or the number of holidays?—I do not recollect; but I do not think there are many holidays.

Sir *Harris Nicolas*, K.C.M.G., called in; and Examined.

Sir *Harris Nicolas*, K.C.M.G.

3586. Mr. *Hawes.*] WHAT is your opinion of the general management of the British Museum as respects the officers, and the facilities and conveniences they afford to the literary public?—I am of opinion that the officers use every exertion in their power to render the Museum useful to the public; that they are attentive to their duties, and show the utmost courtesy to all persons who have occasion to refer to them upon matters connected with their situations.

3587. On the score of the attention of the officers, and the facilities to be afforded, as far as their power extends, the public has nothing to complain of, in your opinion?—I consider that the public has nothing whatever to complain of with respect to the manner in which the officers perform their duties.

3588. With regard to the constitution of the British Museum, the governing body consisting of men of high rank and public functionaries, do you think that the most desirable for an institution like the British Museum?—Certainly not. It has always appeared to me to be a great anomaly.

3589. Why do you consider high public functionaries, and men of rank, not a desirable class from which exclusively to elect Trustees?—With respect to great public functionaries, their time must necessarily be occupied by more important duties; and as to persons of high rank, if they possessed the necessary qualifications, and had proved that fact by their works, they would of course be as eligible as persons who have not the advantage of rank.

3590. You have no doubt as to the inexpediency of selecting such distinguished public functionaries as the Archbishop of Canterbury and the Lord Chancellor as Trustees?—I have no objection to their being Trustees; but I doubt the expediency of entrusting the whole management of the Museum to them.

3591. If, as in the case of the British Museum, the whole management is confined to those great functionaries, do you feel it to be a great objection that they should be so overloaded with official duties, in addition to their labours at the Museum?—Certainly.

3592. It has been stated in the course of the examination that the Trusteeship of the Museum is looked upon by literary men as the blue ribbon of literature. As a literary man, do you entertain that opinion?—I conceive that not only is the Trusteeship of the British Museum the proper reward of a life spent in the promotion of science and literature, but that it ought to be the natural and certain result of such pursuits. For the same reason as the governors of the Royal Academy are chosen from the most eminent Painters, and the governors of the College of Physicians from the most eminent Physicians, ought

ought the most eminent Scientific and Literary men to be selected to govern an institution for the promotion of Science and Literature.

3593. Has it been made a means of rewarding men who have rendered eminent services to science and literature?—I believe there is no instance of a literary or scientific person having been appointed, solely in consequence of his eminence or his fitness, since the year 1791. Before that year a large proportion of the Trustees were distinguished literary and scientific persons. I ought however to observe, that Sir George Beaumont was elected in 1823, principally I believe, in consequence of his knowledge of the Fine Arts.

3594. Then, if it be in your opinion a fit reward for scientific men, you are not able to state any instances, with the exception alluded to, in which that has been conferred upon them?—None.

3595. You are aware that there is a class of Trustees called elected Trustees, into that class might not literary and scientific men be advantageously elected?—I think that class ought to consist almost entirely of literary and scientific persons.

3596. Do you think there are any practical objections to the harmonious working of such a mixed board of scientific men and men of rank?—On the contrary, I think it would be advantageous, not only to the Museum, but to the general interests of literature and science.

3597. In your opinion, the Trusteeship of the Museum presents an opportunity, which the Government ought to avail itself of, for conferring distinction upon scientific and literary men?—Yes; and by doing so, it would likewise confer great advantage upon the public, because those appointments would secure to the administration of the Museum the advantage of the particular talents or knowledge for which the person selected might be celebrated. The Committee will perhaps permit me to refer to the persons who have been elected Trustees from the year 1753, when the first election took place, to the present time. Of the persons first elected, there were at least six who were eminent in science or literature, and persons of that description continued to be chosen occasionally till the year 1787, when Mr. Astle was elected, who was, I believe, almost the last individual who has been chosen solely in consequence of his literary or scientific reputation.

3598. Will you state the names?—In 1753, William Sloane, James West, Nicholas Hardinge, Charles Gray, William Sotheby, Dr. Thomas Birch, Dr. John Ward and Mr. William Watson; in 1761, Mr. James Harris (the author of Hermes), Daniel Wray, Matthew Duane, Sir Hans Sloane, Dr. Kaye, Henry Cavendish, Rev. C. M. Cracherode, Thomas Tyrwhitt (the editor of Chaucer), Thomas Astle and Charles Townley. Since that time two Dukes, three Marquises, and seven Earls, besides many younger branches of the Aristocracy, have been elected Trustees, but not a single literary or scientific man.

3599. Sir *Robert Inglis.*] In the list of Trustees upon the table the following names also appear, and you are requested to state whether you consider them as in the same class as those to whom you have already referred: Sir William Hamilton, in 1788; Sir William Musgrave, in the same year; the Rev. Clayton Cracherode, in 1784; the late John Douglas, Bishop of Salisbury; Charles Townley, Esq., in 1791; in the year 1766, Charles Lyttelton, Bishop of Carlisle?—I consider that down to the year 1791, literary and scientific persons were frequently chosen, and the names now read to me confirm my opinion, because they were all elected before that time.

3600. What is the view which you entertain of the duties of a Trustee, taking the word in the sense in which it is ordinarily applied, and, then, directing your attention to the duties of the officer under that designation in the British Museum, and looking also to any of the Acts of Parliament which have reference to the Museum itself, and which confide the collections to certain individuals as Trustees?—If the term Trustee is to be understood in its ordinary sense, then I have no objection to see the Trustees consist of persons of the highest rank and greatest wealth, for in that sense I consider a Trustee to be a conservator of property, and not a Director of the Institution.

3601. Mr. *Hawes.*] In fact, as mere conservators, there would be no objection to place the whole peerage in the Trusteeship?—None whatever.

3602. You are aware that the elected Trustees are chiefly selected from men of rank; are you aware that the elected Trustees have no votes in the elections of other elected Trustees?—I am.

Sir *Harris Nicolas*, K.C.M.G.

12 May 1836.

3603. Do you think that a desirable arrangement?—Under the present system I think it matters little; but if the elected Trustees were, as I submit they ought to be, chosen in consequence of their scientific and literary reputations, then I think it would be an exceedingly objectionable arrangement.

3604. It is assumed that the present Trustees are elected for some merit besides their rank; in that point of view, what is your opinion of excluding them from the choice of other elected Trustees?—In that case I should think it very objectionable.

3605. Mr. *R. Colborne.*] Is your great objection that they are men of rank, or is it that they do not act, but leave the work to be done by the Archbishop of Canterbury, the Speaker of the House of Commons, and the Lord Chancellor?—My objection is that such Trustees as are elected in consequence of their rank only, appear to me to usurp a position, which, upon every principle of policy and justice, properly belongs to men who are distinguished in science and literature; and which is reserved for them in every other country of Europe. I do not mean to say that it would be judicious to elect every eminent scientific or literary man a Trustee of the British Museum; but I would select from that class such as were also known to be men of high character and sound judgment,—men of the world, accustomed to habits of business.

3606. Then your objection is that the present Trustees look upon it too much as a feather, and that they are in fact inactive?—Yes. That the office is sought for, rather as an honorary distinction, than with the view of taking an active part in the administration of its affairs. I do not, however, mean to say, that all the present Trustees are inactive, because I am desirous not to cast any censure upon them; but I wish to be understood that, in my opinion, the same principle which prevailed in electing Trustees of the Museum until the year 1791 ought to be still continued; in other words, that there should not be, in practice, a ban of exclusion against scientific and literary men.

3607. Mr. *Hawes.*] Do you think that men of such rank are likely to have the best opportunities of selecting the most distinguished men for officers of the Museum?—I should think not.

3608. A former witness was asked whether it was not the case that the appointment of the officers under the present system "must depend upon the accident of an appropriate person having made his way to those Trustees who appoint." The answer to which is, "Literary and scientific men have always friends to write to the Archbishop, the Chancellor, and The Speaker." Do you think that all literary men are so blessed with the acquaintance of such eminent functionaries?—Certainly not.

3609. Then, in point of fact, such high functionaries are not, generally, likely to come into contact with a sufficiently large circle of scientific and literary men in order to enable them to make the best selection?—I should think not; but I understand the question to imply this,—that because the high functionaries alluded to do not come into contact with many literary or scientific men, they are not sufficiently aware of the merits of the individuals; not that they are incompetent to select them, if they did come frequently into contact with them.

3610. But their high rank and their official duty precludes them from possessing that species of knowledge which would render them the fittest judges of the most competent officers?—Very possibly.

3611. Do you consider the great object of the Museum to be the encouragement of science and of literature by its collections and its library?—I consider the great object of the Museum to be to promote the knowledge of literature and science.

3612. As one means of doing that, do you or do you not consider it necessary that accurate catalogues should be accessible to the public, both of the Zoological collections and of the printed books?—I consider full and accurate catalogues in every department of the Museum to be indispensable.

3613. With reference to the catalogue of printed books, is it, in your opinion, as perfect as it ought to be?—I think not. There is no classed catalogue.

3614. The question refers to the catalogue as it stands, such as is accessible to the general reader?—The printed catalogue was made many years ago, and is very imperfect, because it does not, of course, include the subsequent acquisitions to the library; but I am not prepared to condemn the interleaved catalogue, with manuscript additions, which appears to be a good general catalogue.

3615. The

3615. The Committee understand it to be your opinion that a classed catalogue of printed books is desirable?—Certainly.

3616. Would it, or would it not, enable the public to see the desiderata of the library?—It would enable a person who wished to write upon any particular subject to know what books existed upon that subject in the Museum; and by showing what existed, he might ascertain what were wanting.

3617. Do you consider the library in its present state a perfect and good library?—I do not consider it to be a library worthy of the country.

3618. Is it deficient at all, from your knowledge of it, in such books as the Museum is entitled to under the Copyright Act?—It is.

3619. To what do you attribute that, they having the power to furnish themselves with those books?—I believe not so much to the fault of the Officers of the Museum, as to the imperfect character of the Copyright Act, which does not render it sufficiently compulsory upon persons who publish books to send them to the Museum.

3620. Sir *Robert Inglis.*] The defect then is in the Legislature, and not in those to whom the Legislature has confided the particular trust?—In a great degree. I have often asked the question, and I have been told that the fault is in the Act.

3621. Mr. *Hawes.*] Is it or is it not the fact that they have a series of London Gazettes in the library without the indexes attached to them?—It is the fact, not only that the series of London Gazettes produced to the readers, is imperfect, but that in some cases the volumes are bound up without the indexes, which indexes are not, I believe, to be found in the library.

3622. How do you account for that; is it the fault of the Trustees or of the officers?—Not of the Trustees, because they are probably ignorant of the circumstance; but if the Trustees partly consisted of literary men who had frequent occasion to consult the library, it is very likely that they would have become aware of the defect, and from a regard to their own convenience, if from no other motive, would have had it remedied.

3623. With reference to the Catalogues of Manuscripts, what is your opinion of them?—That they are extremely defective. I speak particularly of the Catalogues of the Harleian, the Cottonian, the King's, and the Additional Manuscripts. The Catalogue of the Arundel manuscripts is very good, and the Catalogue of the Lansdowne MSS. is a very fair one.

3624. Can you state any instances of imperfections in the Catalogues of Manuscripts?—I have made memoranda of two or three instances which occurred to me this morning; but I mean to say generally, that from my knowledge of those Manuscripts during the last 15 or 16 years, that all the Catalogues, with the exceptions I have mentioned, are extremely imperfect; and I never spoke to a literary man upon the subject who was not of the same opinion. I will now mention the particular instances to which I have alluded. I will take the Harleian manuscript 2393; the title of it in the Catalogue is "A Poem, Historical, Political and Moral. Its main subject is the unfortunate reign of King Edward the Second. The author at the end calls himself Infortunio, and perhaps might have been Mr. Edmund Spenser." I was much attracted by this description, especially as the Harleian Catalogue notices another copy of this poem, and also supposes it to have been written by Spenser. Misled by this account, I once copied nearly half of the whole poem, intending to print it, when I discovered that it was written by Sir Francis Hubert, and that it was very well known, it having gone through no less than three editions. The error was consequently of importance, as it occasioned me a great deal of useless trouble. The very next article but one, in the Harleian Catalogue, is another striking instance of incorrectness. The Harleian manuscript 2395 is called "An imperfect book in 4to., written by several hands as being an original. It contains part of the Parish Register of Steventon, but in what County that parish is situate, for want of proper helps, I now cannot tell. I believe it is not the town of that name in Hampshire." The person that made this Catalogue must have considered it too much trouble to turn to the Index Villaris, or to any Topographical Dictionary or Gazetteer, to ascertain what county Steventon is in; and even if he had found several places of that name, still he could easily have identified the one in question, because the manuscript contains the name of several incumbents of the parish. I therefore consider it a great defect in a Catalogue, for a person to write four lines, stating

Sir *Harris Nicolas*, K.C.M.G.

12 May 1836.

that he was ignorant of a material fact, of which fact some of the commonest books of reference would have informed him.

3625. Mr. *R. Colborne.*] In what county is it?—I believe, in Berkshire.

3626. Mr. *Hawes.*] Can you state any other instance?—I can state another, which occurred very recently. I had occasion the other day, in writing a Legal work, to refer to an ancient writer called Britton. Finding the printed copies of his work very imperfect, I collated the part I required with several manuscripts in the Museum, which were properly referred to in the Catalogue, but the passage was as obscure in all of them as in the printed edition. By accident, however, I turned to the Harleian Manuscript 493, no part of which is attributed to Britton in the Catalogue, but which contains at least the chapter of that writer which I wanted, if not a very considerable portion of the rest of his treatise, and it proved to be the best copy I had seen, as it removed all my difficulties.

3627. Are there many volumes of manuscripts uncatalogued altogether?—I believe there are.

3628. Will you describe those portions of the manuscripts which are uncatalogued?—I do not exactly know what manuscripts are uncatalogued, because I am only cognizant of the existence of such manuscripts in the British Museum as I find mentioned in the catalogues. There is no printed catalogues of the additional manuscripts from No. 5018 to 6803. There is no printed catalogue of the manuscripts in the King's library, or of Dr. Burney's collection, or of the Stepney papers, or of the Mitchell papers.

3629. Have those manuscript catalogues indexes?—No; Dr. Burney's collection of manuscripts is, however, arranged alphabetically, but the others have no reference whatever to them.

3630. Is not that a serious inconvenience to literary men?—Certainly; and I will mention one instance, in which it has been attended with serious effect. I was appointed by the Record Commission to edit the Privy Council Books of the reign of King Henry the Eighth. I ascertained that there was a transcript in the Museum of one of the Council Books, which I caused to be copied, presuming that the original was not in existence; but on accidentally mentioning the fact to Mr. Holmes, one of the assistants in the library, from whose intelligence and zeal I have often derived much benefit, he asked me if I had seen an *original* Council book which had been purchased by the Museum, and which proved on examination to be the original of the one which I had had transcribed, but to which I had no clue whatever.

3631. Sir *Robert Inglis.*] Do you know how long before it had been purchased?—I believe two or three years. It was mentioned in the manuscript catalogue, but as those catalogues have no indexes there was no reference to it.

3632. Mr. *Hawes.*] Are there as many as 12 or 13 volumes of catalogues without indexes?—I believe so.

3633. Are the manuscript catalogues, as they now exist, fit for the press?—Of that I am not sure; because as I have not compared the descriptions of the manuscripts with the manuscripts themselves, I am not competent to give an opinion on the point. Those which I have had occasion to refer to, seemed to be well described in the manuscript catalogue.

3634. The secretary of the Museum was asked in the course of the examination last year, whether he ever found the duties imposed upon him as keeper of the manuscripts and secretary clash. The answer is, "I am obliged frequently, at this time of the year, to defer some of my employments as keeper of the manuscripts, in consequence of the pressure of business arising from the secretaryship; but they are employments which can be deferred without the least injury to the establishment, namely, the revision and correction of the manuscript catalogues, and the compilation of those catalogues, which may be as well done at one time of the year as another. It is a rule with me to attend first to that which is the most pressing and the most urgent." Do you think, with reference to the state of the manuscript collection, that there is any duty the keeper of the manuscripts can so well discharge for the benefit of the public as that of completing accurately the manuscript catalogues, and preparing them for the press?—I should say that it was the primary and imperative duty of the Keeper of the Manuscripts in the Museum to devote his whole time to perfecting the catalogue of the manuscripts in his custody.

3635. You think the greater part of the manuscript collection must necessarily

sarily be accurately catalogued in order to make use of it?—Undoubtedly, and there ought to be a general classed catalogue of all the manuscripts in the Museum.

3636. And that the labour imposed upon literary men of searching through whole volumes without indexes is a labour which ought not to be imposed upon them by a public institution?—Certainly. My answer is not intended, however, to impute any neglect, or to cast any blame on the present officers. I am only saying what in my opinion ought to be done.

3637. The neglect of duty, if any, in this case arises from the Trustees having entrusted one officer with the duties of two officers, almost incompatible?—I beg leave to repeat that, if among the Trustees there had been two or three persons who were in the habit of constantly using the library, those defects, as well as most others in the library department, would not, in my opinion, have so long existed. They would have seen what was required, and found means for supplying a remedy, even if a special application to the Government, or to Parliament, for funds, had been necessary.

3638. Sir *Robert Inglis.*] Are you aware whether the catalogue of the manuscripts be at this moment in progress, and whether the keeper of that department may not be habitually superintending it, even at the moment when his hand is not actually employed personally in the work?—I have no doubt the keeper of the manuscripts devotes as much time as he can to it. But the question being put to me whether it was not the duty of the keeper of the manuscripts to complete the catalogue, the want of which I consider a great reflection upon the Museum, and as the completion of those catalogues would necessarily require the whole of his time, I thought that it bore in some degree upon the fact, implied in a former question put to me, whether the duties of the keeper of the manuscripts were compatible with any other appointment in the Museum.

3639. Mr. *Hawes.*] Do you know of any forgeries having been committed in the manuscripts in the Museum?—Yes.

3640. Will you state the case?—In nearly every manuscript in the British Museum, to the number of five or six, in which the pedigree of Brydges, Lords Chandos, occurs, the particular line of descent, which was attempted to be established when the barony of Chandos was claimed some years ago, has been interpolated in the most ingenious manner.

3641. Sir *Robert Inglis.*] Could such alleged interpolation have been prevented in any institution to which the public had access, as freely as they have to the British Museum, and would you recommend that the access should be limited, in order to prevent the possibility of such an interpolation or mutilation?—I think such interpolations might be prevented, and the same, or even greater access be afforded to the library, if two or more officers of the Museum were to be constantly present in the reading-room.

3642. To watch the proceedings of the readers?—To give a general superintendence over the whole apartments. At present there is only one officer for the two rooms, much of whose time is taken up with applications from the readers respecting the books they require, admitting strangers to the library, &c.; but if there were an officer whose duty it was to pay particular attention to four or five tables only, it would be scarcely possible to make such interpolations, because he would see immediately if a person were writing in the manuscripts, or throwing, as must have been done in the instance which I have mentioned, liquid over the paper, to discolour the ink.

3643. Are the Committee to understand that the manuscripts to which you allude as having been interpolated, having reference to the Chandos claim, would be legal evidence before the House of Lords, they having been taken from the British Museum?—No, they would not be legal evidence.

3644. Then their value would rather be as aids to historical researches elsewhere?—Yes; but although manuscripts in the Museum are not legal evidence they may be alluded to in the speeches of counsel, as you would allude to an historical work.

3645. Did you become personally cognizant of the interpolation or mutilation to which you have now referred in the course of any inquiries in reference to the Peerage claim?—No. But having considerable doubt of the merits of the Chandos claim, and feeling an interest in the question, I examined all the pedigrees of Brydges in the British Museum, thinking that as they were written about the time of the birth of the person from whom the claimant deduced his

Sir *Harris Nicolas*, K.C.M.G.

12 May 1836.

pedigree, he might be mentioned in some of the genealogical MSS. in that collection.

3646. Can you state when you discovered the interpolation in question?—Six or seven years ago.

3647. Did you make known your discovery to the proper authorities?—I mentioned it at the time to Sir Henry Ellis, and he desired me to call upon him some other day, and he would cause it to be noted. Its not having been done may have arisen from its having escaped his recollection.

3648. The alteration was discovered at any rate a considerable time after the decision of the House of Lords upon the question?—Yes, many years.

3649. Have you any means of stating to the Committee with any approximation to accuracy the period at which such interpolation is, in your judgment, assumed to have taken place?—No, I cannot.

3650. Mr. *Hawes.*] Is it or is it not your opinion that the catalogues should be kept up even with the contents of the Museum?—Undoubtedly they ought to be so.

3651. The Committee were informed last year by Mr. Forshall, in answer to this question, "Is it not desirable that any work of this description or general descriptive catalogue should always be kept up even with the contents of the Museum?" "I think not; I think it is scarcely possible with a due economy, in the strict sense of the words of the question." Do you agree in that opinion?—Certainly not.

3652. The reason assigned for that was the following: he says, "It depends upon circumstances; supposing for instance that my catalogue of manuscripts was at this day quite complete, and that there was nothing further to be done, I might be three months without any acquisition, and all the establishment of my department would have nothing to do, or very little to do, for those three months; that would be an evil arising if the catalogue were quite complete, in the sense of the question. It is enough to keep it on a general level with our acquisitions." What is your opinion as to delaying the catalogue with a view to employ the leisure hours of the officers?—It seems to me that the latter part of Mr. Forshall's statement contradicts the first. In my opinion, the catalogues ought to be kept on a level with the acquisitions, and such appears from that statement to be Mr. Forshall's opinion also.

3653. You think that any notion of keeping the catalogue in arrear for the purpose of employing the establishment is not a sound reason for the non-compilation of the catalogue?—Certainly not.

3654. Mr. *Baring.*] The answer to that question infers that the establishment should be kept up at all times of sufficient strength to complete immediately a catalogue of any number of books that might be brought into the institution. Do you think it would be advisable to keep up such an establishment?—I am of opinion that such an establishment ought to be maintained as would ensure the catalogue being always kept up with the very latest acquisitions, and that the index to those catalogues should likewise refer to the most recent acquisitions; in other words, that the public should always have the means of knowing exactly the contents of the British Museum in every department.

3655. Does it not appear from the answer of Mr. Forshall that his objection is to going to so great an expense as to maintain an establishment sufficient immediately to class and catalogue every acquisition of the Museum, but that he does not object to such an extent of the establishment as would enable the institution to keep up the catalogue upon a general level with the acquisitions?—It appears to me that there has been some mistake in printing Mr. Forshall's answer. I am sure that Mr. Forshall could not mean that there should purposely be a deficiency in the catalogue of the manuscripts in the Museum, simply for the purpose of keeping any particular individuals attached to it in employ. When that question was put to me, I thought that the latter part of Mr. Forshall's answer agreed with the view I took of it, because as it stands, without the latter part, it appeared to involve an absurdity.

3656. Mr. *Hawes.*] In the subsequent answer it does not appear that the latter difficulty is overcome by assuming the answer to have been incorrectly taken down, because by the subsequent question Mr. Forshall is asked, "Then why should that catalogue not be completed, with a view to its usefulness, and not merely be kept in progress with a view to employing the officers in doing it?" The answer is, "I am only speaking of a thorough and exact completion," drawing

drawing a distinction between an imperfect and a perfect completion. The answer goes on, "In all public establishments where expedition immediate upon the emergency is not of great importance, it is more expedient that the business should be a little ahead of the establishment than that the establishment should be ahead of the business. This last alternative might induce supineness and other evils. And so it is with regard to catalogues; it is better to be a little in arrear; I am not, of course, speaking of a great arrear." Now do you think it is better to be in arrear in so important a work as that of a catalogue, without which the collection is comparatively useless?—I think there ought to be no arrears whatever; for if the catalogue be in arrear, even of a single manuscript, that manuscript (like the case which I have already mentioned) might be an original, and a person from ignorance of its existence may be copying, or printing from, an imperfect transcript of it.

3657. What is your opinion of the classed catalogues of the manuscripts?—There is a classification in the fourth volume of the Harleian manuscripts. There is no classification of the Cottonian or Lansdowne, but there is an attempt at the classification of the Additional Manuscripts, in the two volumes, by Ayscough.

3658. What is your opinion of that?—That it is useful, though not what it ought to be. It is confessedly imperfect, but it is better than no classification at all.

3659. With regard to the expediency of a classed catalogue generally, your opinion is that it should be formed forthwith?—Undoubtedly.

3660. Had you ever occasion to make one yourself for your own use?—In 1823 I printed a small book, containing a classification of all the Herald's Visitations in the British Museum; and to my surprise I was called upon to enlarge it for a second edition, which contains a reference to the most valuable genealogical manuscripts in the Museum under the respective counties or subjects.

3661. Is that index in the reading-room of the Museum?—It is not among the catalogues in the reading-room.

3662. Can you state why it is not?—It is impossible for me to state why it is not placed among the other catalogues. The officers must answer that question.

3663. Have you not had occasion to supply deficiencies in some catalogues of the Museum at your own expense?—I printed an index to render the catalogue of the King's manuscripts more useful, for as that catalogue is arranged it is impossible, without much trouble, to ascertain from the number of the manuscript in what page of the catalogue it is described. The object of the index which I printed was to facilitate such references. I sent some copies of the index to the British Museum, which the Trustees very courteously acknowledged.

3664. In the course of the examination of last year, reference was made to a work of yours, entitled "Observations on Historical Literature," where it was stated, at page 75, that the description of all the manuscripts from No. 5030 to 5511, that is 480 volumes, only occupied six pages. Mr. Forshall subsequently noticed that statement, and pointed out its incorrectness. Have you any observations to offer?—I am very glad the Committee has given me the opportunity of explaining it. It is one of those errors which it is impossible to account for, but which every literary man knows will occur. The book was hastily written, and I suppose I had written 36, and that the 3 which ought to precede the 6 had either not been copied by the amanuensis who transcribed my manuscript, or that it is an error of the press. That I had no design to deceive the public is obvious, because I gave the numbers of the manuscripts, so that any person might at once detect the mistake.

3665. Sir *Robert Inglis*.] Does not the whole stress of the passage depend upon the contrast between the No. 480 applied to the volumes, and the number six as applied to the pages; and would such contrast have existed if the number had been 480 volumes to 36 pages?—The contrast, of course, would not have been so striking; but if I were to write the volume now, I should still point it out as evidence of the defect of the Catalogue.

3666. Do you know the proportion which the manuscripts catalogued in the French King's catalogue bear to the manuscripts in the Harleian catalogue, taking the printed matter in a page of the Harleian and comparing it with the printed matter in a page of the French King's catalogue?—No, I do not; and whenever I have given an opinion upon anything connected with the British Museum or with any other institution, I have never thought whether the systems adopted in other

Sir *Harris Nicolas*, K.C.M.G.

12 May 1836.

countries were perfect or imperfect; I merely looked at the one of which I was writing, and considered whether it was such as it ought to be, and not whether it was as good as similar things or institutions elsewhere.

3667. Then you took an abstract standard of perfection, by which you have tried the institution respecting which you were writing, rather than any standard to which you could point attention as in actual existence?—No. I did not found my opinion upon abstract standards of perfection upon the point immediately under consideration. I had many existing standards. I had the standards even of the first two volumes of the Harleian catalogue itself, in which, though far from complete, the MSS. are much more fully described than in the third volume. I had also the standard of the Lansdowne catalogue, as well as of every good catalogue of manuscripts in existence.

3668. Mr. *Hawes.*] There is a classed index of the Harleian manuscripts, executed by Mr. Horne?—There is, in the fourth volume.

3669. Does that satisfy you?—It is not so perfect as it ought to be, but it is exceedingly useful, as it renders the other three volumes much more serviceable than they otherwise would be.

3370. What would be your opinion of pasting inside each volume a description of each manuscript in those collections of which printed catalogues exist?—I think it would be extremely useful, and I have already suggested it to the keeper of the manuscripts.

3671. Together with such amendments as might be made from time to time?—If that were done, and a page of blank paper were inserted after the printed description, and the readers were invited to make any remarks upon the blank paper illustrative of the contents of the volume which might occur to them, much valuable information would probably be given. The great difficulty which literary men experience is to know what has been already printed. If it were the rule of the Museum that whenever a person copied anything for the purpose of printing it, he should state in the MS. the name of the work in which it is published, it would be very useful. It should also be the duty of the keeper of the manuscripts to cause a notice to be written in one copy of the catalogues, to which the public might have access, of the work in which such of the articles as had been printed might be found; and the readers ought also to be encouraged to make similar references.

3672. Would it not be desirable to have a numerical list of the manuscripts in the Museum, by which greater facility would be given in referring to the manuscripts by means of the numbers?—The manuscripts are in most of the collections numbered; but I think it would be very useful also to number every printed book in the library, because such a reference would at once specify the particular copy of any work that might be required, and would often save the trouble of copying a long title-page. This system has, I believe, been adopted in the library of Göttingen, and elsewhere; and I feel very strongly that it would be found of great practical utility, as well in preventing disappointment to the readers, as in saving the time of the attendants.

3673. In the event of a writer printing any particular manuscript in the Museum, would it not be desirable that he should give notice of his intention, and that it should be recorded?—I think very desirable; and this is in most cases done; for whenever an article intended to be printed is of any length, application must be made to the Trustees for permission to copy it. Permission is granted almost as a matter of course; and those applications become a record of all long articles or entire manuscripts which have been printed, or rather of such as are intended to be printed.

3674. Have you ever had occasion to examine those volumes of manuscripts that were injured at the fire at Cotton House?—Yes; and it appears to me that it would be very desirable that some of them should be copied.

3675. Do you think the leaving that number of manuscripts in the state in which they are is creditable to the Museum?—I am not aware that anything could be done to improve them; but if the question means, whether it would be useful to have them copied so as to render their contents more available, I should say that it would be very desirable.

3676. There are remnants of about 130 volumes?—Yes, some of which are utterly useless; but others are more or less legible, and some of them are of great historical value.

3677. Is it not desirable that their contents should be examined, and that they

they should be made known forthwith?—Certainly; if they are not already known.

3678. Mr. Forshall stated in the last year's examination, in answer to a question whether there were not 130 volumes which remained unrolled and unexamined till 1834, "Yes, a considerable number remained unopened;" do not you think that that implies a little neglect?—If they have not been opened every means ought to be taken to discover what they contain; and to render such of them available as are worth copying.

3679. Sir *Robert Inglis.*] In reference to the particular manuscripts to which your attention has last been directed, are you aware that there was a catalogue of them which had been printed previously to the fire?—Yes; but it was a very imperfect catalogue. It was, however, in consequence of the reference to the general contents of these manuscripts in that imperfect catalogue that I was led to the particular manuscripts which I should desire to see copied.

3680. Had it remained unopened till your examination of it?—I should think not, because it was one of those which was not in a very bad state.

3681. Mr. *Hawes.*] Do you think a classed catalogue of the manuscripts, and a classed catalogue of the printed books, would be a work, if published in parts, susceptible of any general sale?—Of some sale; but I have considerable doubt whether it would be a sufficient sale to cover the expense of publication.

3682. The Committee having been informed that a catalogue is in progress both of the printed books and of the manuscripts, do you think it desirable to publish it in parts, and allow the public to purchase it in parts?—I desire to see it published in parts, and for this reason, that as a certain portion was done, it would immediately become available to the public, without waiting for a long and indefinite period for the completion of the whole. Supposing the letter A or the letter B were done, and that one or both formed a reasonably sized volume, I should wish it to be published, so that the public might purchase it if they thought proper. In many cases the completion of a part would satisfy the wants of a particular class of literary or scientific men. For example, the section of the scientific division, which included mathematics, would be important to mathematicians; and of astronomy, to astronomers. So in literature; the historical division would satisfy the wants of historians.

3683. Do you think it would cover the expense of paper and print?—I have not the necessary knowledge of the state of the book trade to answer that question; but I have very little confidence in the public buying any works of a standard and abstruse nature.

3684. Sir *Robert Inglis.*] Judging from the specimen (to which you have already directed the attention of the Committee) of the work printed by yourself, have you reason to think that a publication upon a larger scale would pay its expenses?—To judge from that specimen I should answer in the affirmative, because it did sell to some extent, a second edition having been required; but I by no means think that that tract is a proper criterion by which to form a judgment of the probable sale of a large catalogue.

3685. Mr. *Hawes.*] If the booksellers find it their interest to publish catalogues, and to publish classed catalogues, and of course find a sale for them, do not you think that, *à fortiori*, the catalogue of a library like that of the Museum would obtain general sale both here and abroad?—I do not think the cases are similar to each other. A person who wants a particular book, or who was forming a library, might give 2*s.* 6*d.* for a bookseller's catalogue, because it may direct him to the articles which he desires to possess; but a classed catalogue would be a work of considerable expense, and would be principally of use to authors and students.

3686. Will you look at the catalogue now shown to you?—This is the catalogue of Mr. Rodd's stock, and forms no criterion, because it is done with a specific object, namely, to advertise his stock in trade, and not for sale.

3687. Sir *Robert Inglis.*] You think no analogy can be drawn between the publication by a bookseller of the contents of his own stock exposed for sale, and a catalogue of articles not intended for sale?—Certainly not.

3688. In your belief a bookseller publishes a catalogue not in the hope of selling such catalogue, but of selling the articles therein enumerated?—Yes. The best mode of obtaining information of the probable sale of a classed catalogue of the library of the British Museum would be to ask some publisher who had published a bibliographical work; take, for example, Watt's Bibliotheca Britannica.

Sir *Harris Nicolas*, K.C.M.G.

12 May 1836.

tannica. I do not believe that it was a successful speculation. Take, again, the Bibliographer's Manual, lately published by Mr. Pickering, which has, I am told, a slow sale.

3689. Mr. *Hawes.*] The question with reference to published catalogues was asked upon this ground, that apart from any commercial value which might attach to such a catalogue, the knowledge it would give of the contents of a library like that of the Museum would be a sufficient inducement to the purchasers to buy it?—I have considerable doubt of that.

3690. Do not you think that particular writers or authors would buy particular parts?—Yes.

3691. And thus a catalogue of a national library, comprehending all classes of literature, would be susceptible of a great sale by parts, though, as a whole, it might not be saleable?—I have before stated that I should recommend such a catalogue to be published in parts, and given to the world as soon as each part was complete. But without reference to the probability or improbability of a sale, I am of opinion that it is the duty of the governors of an institution like the British Museum to publish as perfect a catalogue of its library as the talent at their command can produce; and which ought to be so complete as to bear being considered in foreign countries, as a test by which to judge of the state of bibliographical knowledge in England.

3692. Sir *Robert Inglis.*] Is there any great catalogue to which, in your judgment, you would think fit to refer the Committee?—No. I speak with great diffidence on bibliography, as it is not a department of literature to which I have paid very particular attention.

3693. Would you regard Rodd's catalogue as a classed catalogue?—Classed to a certain extent. It is susceptible of a number of subdivisions, but as I have not seen it before, and therefore have not examined it, I really can give no opinion upon it.

3694. Thorpe's catalogue does not profess even to be a classed catalogue?—No; it is a mere catalogue of his stock. The best classed catalogue we have upon a large scale is Watt's. But I may add, that in my opinion, it is absolutely necessary that such a catalogue of the library of the British Museum should exist, and that the expense of forming it ought not to be an obstacle to its compilation and publication, though of course it would be wise to reduce the expense by promoting the sale of the work, both in parts, and as an entire work, when completed.

3695. *Chairman.*] Supposing a considerable loss to be incurred in the execution of such a work, do you, as a literary man, consider it of such importance as to warrant you in recommending the Trustees of the Museum to apply for an augmentation of their funds for the special purpose of enabling them to accomplish that object?—Undoubtedly.

3696. You think it a work of so much importance as to be worthy of that step being taken?—I think it is almost a *sine qua non*, if the contents of the library of the British Museum, are really to be made useful to the public.

3697. Mr. *Hawes.*] Have you formed any opinion as to the safe custody of the manuscripts in the Museum?—I believe the manuscripts in the Museum are kept as perfectly as they can be. The facility with which the manuscripts are consulted has always been the subject of my admiration; and it forms a striking contrast to the printed books department.

3698. Are they sufficiently under the control of the keeper or the assistant keeper?—I should think so. His apartment is close to the room in which the manuscripts are kept, and he is frequently passing through it. In the larger room there are constantly persons employed, and it appears to me impossible that any injury can happen to them.

3699. Sir *Robert Inglis.*] In the evidence which you gave before another Committee yesterday, you referred to an article in the Westminster Review, in the month of April 1829, as written by yourself; your attention is therefore requested to the same article now. You therein refer to the feelings which literary men experience in the British Museum, and you state, "there he has only to ask for the manuscript he requires. He uses them as copiously, and changes them as often as he would the books in his own library; he incurs no obligation in gaining admittance; he studies when and for as long a time as he pleases; his mind is undisturbed by fearing to encroach on the politeness of others; he meets with no obstacles; the attendants are courteous and obliging, because they know that their places depend on their behaviour. Anything more delightful

in

in this respect than that establishment cannot be imagined; and the important benefit which the public derive from it is irrefragable evidence in favour of rendering every other repository of information, and above all, every public repository, as easy of access, as well arranged, as properly conducted, and as free from the disgrace of fees and perquisites. At the British Museum a whole volume may be copied merely by asking permission, and one-third of it without leave; the Trustees properly encouraging the publication of its stores." Do you retain the opinion there expressed?—I retain the opinion to the fullest extent. But it ought to be remembered that I was then contrasting the British Museum with Record offices, and that I have never pretended that the British Museum was not susceptible of improvement. With this slight qualification, however, I wish not only to adopt what I said in that article in the year 1829, but to add, that the experience of the seven years which have elapsed since it was written, has rather confirmed than lessened my opinion of the general merits of the institution.

3700. In the Preface to the Privy Council, vol. I. page lxxii, you have said, "Every facility which a public library allows was, however, afforded him, in the most obliging manner, by the Rev. J. Forshall, the keeper of the manuscripts in the British Museum; and he gladly offers his best thanks to that gentleman for his attention to him." Do you still retain that opinion?—I do, most decidedly; and I wish particularly to specify in what that attention consists. I did not merely mean the common courtesies of life, but I alluded to a circumstance which it is useful that I should state to the Committee. I am employed upon a work (published at the public expense), which requires collation by some one reading the proofs aloud to me whilst I read the manuscript. It was impossible that this could be done in the Reading-room, and Mr. Forshall permitted me to pursue my task in the manuscript-room, which is occupied by the gentlemen employed on the catalogues. In any alteration of the Museum it appears to me desirable that there should be some small rooms appropriated to the purpose of collation, so that the general readers might not be disturbed by others reading aloud, and that the gentlemen of the establishment should not be incommoded by their own apartments being intruded upon by strangers. I would also add, that I should be glad to see every public institution, and more especially one of so much national importance as the British Museum, so conducted that there would be no necessity for asking for the necessary accommodations for literary pursuits of any kind whatever, as a matter of favour.

3701. Mr. *Hawes.*] With regard to the custody of those manuscripts, in reference to the charters and rolls, which are about 20,000, are they not under the care of one of the attendants, who keeps the keys and supplies what are wanted, leaving them without any superintendence of the keeper and his assistants?—I do not know where they are kept, but they are brought in the same way and by the same persons as those who bring the other manuscripts.

3702. Do not the officers in the Museum sit in a separate room from the Reading-room?—There is an inferior officer of the Museum who presides over the Reading-room, and I am anxious to say a few words in relation to that individual. I have watched his conduct closely for more than 15 years, during which time I have always been impressed with his attention to his duties, with his extreme courtesy, and with the desire which he manifests to render the resources of the library as available in every way as possible. The gentleman to whom I allude is Mr. Cates. But at the same time that I render this just tribute to Mr. Cates's merits, I think it very desirable that there should always be officers in the Reading-room of a higher grade in point of acquirements, who would be competent to afford information in any department of literature, particularly in reading ancient manuscripts, or in directing students to the best writers upon all subjects.

3703. Sir *Robert Inglis.*] With reference to having a separate room in which collation may be carried on, are you aware that at this moment the advantage which you receive, according to your view of it, as a personal kindness, can be received by any one not having the same personal access as yourself?—I have never known an instance of its being denied; and I believe it would not be denied; but I was not aware that any one could demand it as a matter of right.

3704. Are you aware of there being a register of all charters, which any visitors may desire to see, and which register contains an entry of every such charter

Sir *Harris Nicolas*, K.C.M.G.

12 May 1836.

so exhibited to every stranger?—Yes; in common with all the other manuscripts.

3705. Mr. *Hawes.*] An entry of every charter exhibited?—Yes; if any person writes for a manuscript (and those charters are subject to the same arrangement), before the attendant brings it, he enters in a book, kept for the purpose, the name of the applicant, the number or title of the manuscript, and the day of the month. This is a very proper regulation, because if a manuscript be injured, they can trace in whose hands it has been.

3706. May it not be used by some persons in the Reading-room without any of their names being entered?—I think not.

3707. Are there some manuscripts called select manuscripts?—There are.

3708. What is your opinion as to the propriety of that classification?—The classification is little more than nominal; I have never known the production of them refused.

3709. Have you not known some of the most valuable manuscripts which are called select, not refused, but used too freely by persons who are not aware of their value?—No.

3710. Do not many casual visitors see many of the more curious and rare manuscripts?—No. What I mean by casual is this; if any person known to one of the officers wishes to show ladies the curiosities of the library of the Museum, the illuminated and choice manuscripts are produced, but they are not injured.

3711. Has not the Alexandrian manuscript been injured by exhibition?—Not that I am aware of.

3712. Has not its exhibition been forbidden?—I do not know. I never heard so.

3713. Do not some of the attendants exhibit those select manuscripts without the control of the keeper or the assistant-keeper?—Not to my knowledge.

3714. When the two keepers are absent, must they not necessarily be in the hands of attendants?—I should say not; because I remember that I once made it almost a subject of complaint, that I could not refer to one of the select manuscripts because the officer in whose custody it was, happened to be absent; and a doubt arose in my mind whether such an impediment ought to exist, thinking that if the officer went away he should leave the key with one of his colleagues, so that the public might at all times be able to see any manuscript in the Museum.

3715. Is it your opinion that the officer inspects the manuscript before it is put away after it is used?—If the officers were to do that in the case of every manuscript which is used, you must have a corps of officers as extensive as the corps of engineers. Some faith must, in an institution like the British Museum, be placed in the public that they will not injure the books.

3716. You think the present officers exercise sufficient control and superintendence over the manuscripts to prevent their being injured or lost?—The only alteration I would suggest refers to what I before stated, that there should be more officers in the Reading-room. I do not mean the highest class of officers, but such a class as would be competent for the purposes I have before mentioned, and who would detect any injury which might be attempted to be done to the manuscripts, and enforce the regulations of the establishment; such regulations, for example, as that no person shall place the paper on which he is writing on the MS. from which he is copying. People in the haste of transcribing frequently do this, to the possible injury of the original; and I remember having sometimes done so myself, and that I was very properly reminded by the present chief librarian that it was wrong; but now as there is only one officer in the Reading-room he cannot exercise that general surveillance over the two rooms which I think desirable.

3717. By the regulations in the Museum the attendants come at nine and stay till five, whereas the officers come at ten and stay till four, therefore the manuscripts during two hours are entirely under the control of the attendants?—I should doubt it; I believe they are locked up.

3718. Have not the attendants keys?—There is a regulation about the keys which appears to me absurd. The attendants, who, though respectable men, are not men of education, are entrusted with keys, but the gentlemen who are employed in making catalogues are not permitted to have a key to the cases containing the manuscripts. I state this to show that there is no want of vigilance about the keys, however much the system may require alteration.

3719. Do you think there is any objection in allowing the attendants to exhibit the select manuscripts?—I am not aware that they do; I have never seen them do it.

3720. With reference to the hours of admission to the library, are you of opinion that they might be judiciously extended?—I think they certainly ought to be extended, and that the public have an indisputable right to expect it.

3721. Would you allow admission earlier in the morning and later in the evening?—I am not sure that I would allow admission earlier than nine o'clock, or perhaps eight, in the morning; it would depend whether there were two sets of officers; but I think that from nine o'clock until an hour before sunset throughout the year there can be no possible objection to keeping the establishment open. This would avoid the extreme propositions of having it open from six o'clock in the morning until ten at night.

3722. Are you not aware that the former regulations of the Museum allowed admission at an earlier and a later hour?—I have heard so. In an old book called a "Description of London" it is so stated, and in the authorized publications of the Museum.

3723. *Chairman.*] You stated from nine o'clock in the morning till one hour before sunset; why do you specify one hour before sunset?—Because if you were not to close the Reading-rooms until sunset it would become dark before you had time to put away the books. The present regulation of closing the library at four o'clock throughout the year has the effect of excluding from it a large portion of the community of London, namely, those numerous persons who are extensively engaged in professions, as well as merchants, and clerks of all kinds.

3724. Might it not be extended to the hour of sunset?—Certainly, unless it be found necessary to have an hour before dark to put away the books.

3725. With convenience and propriety?—Yes; but I think you must then have two sets of officers; for to keep the same individuals in attendance from eight in the morning until sunset would in summer be rather hard duty. My opinion respecting the opening and closing of the British Museum and its present condition is in general terms this;—that the longer it can be kept open with safety the better; that the public have a right to expect as extensive a use of their own property as possible; and that the question of money or expense ought not to prevent an extension of the present hours, for if double the number of officers be required to give increased facility to the public, double the number of officers should be provided. I think that many of the defects in the library and in other parts of the establishment, which I wish to see remedied, are to be attributed to the want of funds, rather than to the fault of the officers; hence most of the improvements which are desirable will depend upon the increased liberality of Parliament. But in admitting thus much, I beg leave at the same time earnestly to press upon the Committee the propriety of acting upon the former system of admitting literary and scientific men as Trustees, a measure which I am perfectly convinced would tend materially to the advantage of the institution, and be extremely desirable upon other grounds.

3726. Mr. *Hawes.*] With reference to a part of the evidence of last year relating to the Baron Joursanvault's manuscripts, have you anything which you wish to add?—I am not aware of anything. I have read Sir Henry Ellis's explanation, and I have also since read the letter from my late friend Sir Thomas Croft, from whom I derived the facts contained in my statements on the subject, which completely bore me out in all which I have asserted; but Sir Henry Ellis has explained the circumstance somewhat differently, and of course his explanation is entitled to weight with the Committee.

3727. He has stated in explanation, that he was five or six hours engaged in the examination of those manuscripts?—Perhaps Sir Henry Ellis may be more dexterous and expeditious in such examinations than others; but I must say that I should certainly distrust my own power to do it in that time.

3728. Have you any opinion as to that collection of manuscripts founded upon any information which you think entitled to weight?—I am still of opinion that if they could be purchased without acceding to the ridiculous proposition, that our Government should use its influence with that of France to raise the present owner of the MSS. to the rank of Count, and that he should be allowed to import a certain quantity of wine into this country duty free,

Sir *Harris Nicolas*, K.C.M.G.

18 May 1836.

free, it would be desirable; but as he acted so absurdly, there was necessarily an end of the bargain. Perhaps the Committee will allow me to make another observation. I think it would be very useful if a printed statement were circulated, containing directions for using the Library. It often happens that people obtain admission to the Reading-room who do not know where the catalogues are placed, how they are to obtain the books, whether they are to return them to the librarians, or leave them on the table, &c., and general directions on these minute points would save them much embarrassment. These directions should be given with the card of admission. I am aware that the card is now accompanied by some general directions, but they are not sufficiently minute.

3729. Do you recollect that part of the evidence which relates to the daily pay doled out to literary men?—Yes. I think it is stated that every person employed as an assistant in preparing catalogues, and in other literary labour in the Museum, receives a rate of daily pay, which is stopped if they happen to be away, even for a single day, though it may be caused by illness. The system presumes a want of vigilance on the part of the officers in not causing their assistants to attend to their duties as regularly as they ought to do, and is discreditable in itself.

3730. It is a fact then that their pay is stopped if they are absent?—Yes, if they are absent from illness, or any other cause whatever; and it is also stopped upon the holidays, and on other occasions when the Museum is closed, as if their absence was their own fault.

3731. Sir *Robert Inglis.*] Are you aware whether this system, to which you have referred applies only to the case of young men admitted to junior places in the Museum, and that the higher officers of the Museum are paid by annual or monthly salaries?—I am aware of that; but still the system of daily pay prevails in some degree even with the higher officers, as they are paid for so many days in the week only as they attend. There is no general retainer of service.

3732. Mr. *Hawes.*] Dr. Rosen is one of the juniors?—Yes; and I think it is but just to state to the Committee that, without any desire to underrate the merits of the senior officers of the establishment, it does appears to me, that the junior officers or assistants are fully as much entitled to consideration. They are all, I believe, gentlemen of education; and so far as my knowledge extends, I can bear willing testimony to their abilities, zeal, and attention to their duty. I hope the Committee will permit me to observe, before I conclude my evidence, that in pressing the claims of literary and scientific men to be appointed Trustees of the British Museum, I have been no less actuated by the desire to promote the interests of the institution, than to advance those of science and literature. It is a general remark that the position of men of science and literature in this country is very unlike their position in every other country of Europe; and perhaps the most forcible illustration of that fact, is the extraordinary circumstance that for the last forty years they have been entirely excluded from the government of the only literary institution of the kingdom which is supported by Parliament.

3733. Is Ayscough's catalogue of charters kept in the Reading-room?—It is not kept in the Reading-room; it consists of three very large volumes, and if they were kept in the Reading-room they would very likely become unfit for use, as they are old and easily injured; but any person who wants them, has only to desire the attendant to bring him the manuscript catalogue of Charters.

3/3

Martis, 17° *die Maii*, 1836.

MEMBERS PRESENT.

Mr. T. G. B. Estcourt.
Mr. Hawes.
Mr. Elphinstone.
Sir Philip Egerton.
Sir Robert Inglis.
Mr. Thornely.
Mr. Ridley Colborne.

MR. T. G. B. ESTCOURT, IN THE CHAIR.

Mr. *John Murray*, called in; and Examined.

Mr. *John Murray*.

17 May 1836.

3734. Mr. *Hawes*.] ARE you acquainted with the catalogues and manuscripts of printed books in the British Museum?—Very little.

3735. Have you ever had occasion to consult them at all?—No, never.

3736. Are you of opinion that a classed catalogue of all the manuscripts according to the subjects, upon a plan somewhat similar to the classed index to the Harleian manuscripts, would be a valuable work?—Having stated that I am unacquainted with the catalogue, it is necessary to say that it is only from the accidental circumstance of my having been in the habit of considering the subject that I am enabled to state that a classed catalogue, according to the plan just suggested, would, in my opinion, be a very valuable thing indeed; that I conceive that literature is now so much cultivated and extended over the whole country, that if the catalogues were known to be in existence, and thoroughly advertised and published as any other book, vast numbers of people throughout the kingdom would buy that catalogue.

3737. Speaking, therefore, commercially, as well as in a literary point of view, it would be, you think, a valuable publication?—My own opinion is that it would be commercially so.

3738. Are you of opinion that it should be printed in octavo?—In octavo, and at a very reasonable price; not ostentatious in point of expense of printing, or anything of that kind.

3739. Is it your opinion that the publication would pay the expense of print, paper, and advertising?—My opinion is that it would; that is to say, supposing it were given to me made out, I think I might say that, upon reflection, probably I should venture to print it at my own expense.

3740. Assuming, therefore, that the publication was one of importance, and therefore undertaken by the Museum authority, you think that it would pay you to publish it?—I think so.

3741. Sir *Robert Inglis*.] With reference to the collection of printed books; have you formed any estimate of the extent to which a catalogue of the contents of the British Museum, printed in octavo, would run?—I think I have heard that it would extend to perhaps 18 or 19 vols. Were I to undertake the publication, I should publish it in parts.

3742. Mr. *Hawes*.] As the various parts might be interesting to different classes of purchasers?—Yes. I mean that the catalogue being prepared according to the arrangement of the Museum, I should propose to publish it in parts, each containing an equal number of pages.

3743. Sir *Robert Inglis*.] The question referred to the printed books, and did not necessarily involve the consideration either of a classed or an alphabetical catalogue; would it be consistent with your views to publish in parts a purely alphabetical catalogue, or do you limit that answer to the publication of the classed catalogues?—A classed catalogue.

3744. Mr. *Hawes*.] From a manuscript catalogue, digested and arranged by the Museum authority?—Yes, such as I should, as a publisher, approve. I should publish it in parts, just as an Encyclopædia.

Mr. *John Murray.*

17 May 1836.

3745. So as to induce purchasers by the small expense of each number, and spreading the expense over a longer period?—Yes.

3746. Sir *Robert Inglis.*] So as not to tempt the purchaser of the classed catalogue of natural history to purchase the catalogue of the collection of theology, but to run the classed catalogue of the one department, for instance, into the classed catalogue of the other, supposing there were not accidentally a subdivision at the end of the particular class?—Yes; because I conceive the small price would induce persons who wanted natural history, for instance, to pay for an extra number in theology to get the number in natural history.

3747. Mr. *Hawes.*] But when the whole was published, it would then be susceptible of being purchased in classes?—I do not know, because one class would run into another.

3748. At the completion of the work, might it not be so arranged as to enable purchasers to buy distinct classes?—I dare say it might be so. I do not mean to say I should undoubtedly follow this plan of publication; I have not made up my mind to it; for if I had the whole MSS. laid before me, I might very probably divide each class into a certain number of parts, according to the quantity of MSS., so that the parts belonging to one subject should not run into those of another.

3749. By a little additional expense, might it not be done?—Yes.

3750. Your opinion is adverse to the publication of catalogues in folio?—I consider it an utter waste of money, and destroying the very object of it.

3751. Have you any decided opinion as to the value of a classed catalogue and of an alphabetical catalogue?—To publish a classed catalogue would be ten times more valuable than an alphabetical catalogue.

3752. Would it be more useful in a literary point of view?—I think it would be of the greatest value in the world.

3753. Sir *Robert Inglis.*] From your knowledge of the bookselling business, can you state whether the majority of the booksellers who publish catalogues adopt the alphabetical or the classed formation?—The catalogues of auctioneers, which I am most in the habit of seeing, are always alphabetical.

3754. Mr. *Hawes.*] There are also some classed, are there not, such as Rodd's?—I am not conversant with catalogues of that sort; it is merely as a publisher I speak.

3755. In your opinion, a classed catalogue would not only be valuable in a literary point of view, but it would be unsuccessful as a commercial speculation?—Yes.

3756. Sir *Robert Inglis.*] Do you state this opinion to the Committee upon any knowledge of the success which has attended the publication of any catalogue, classed or alphabetical, in England or abroad, as a commercial speculation?—I am merely expressing it as an opinion formed. When I saw the catalogue of the King's library in folio, it induced me to reflect; and for many years I have been thinking upon the subject; and I can give my opinion that I, as an individual publisher, think I could venture to publish such a catalogue at my own expense.

3757. But the publishers generally of catalogues have not adopted that system, and you are not aware of any which has been successful at home or abroad?—I merely give an opinion. I am not conversant with catalogues at all; but, as a publisher, I think I could safely publish it at my own expense.

3758. Mr. *Elphinstone.*] Would you undertake to publish it if it is determined upon?—I have not had time to think of it; but my own opinion is that I would undertake the expense of it, if it were given to me thoroughly digested.

3759. Sir *Robert Inglis.*] You mean that if the copy were given to you free of all charges for having made it, you would then undertake the mere printing and publishing?—Yes, the expense of the paper and printing in every respect as every other book that was my own property.

3760. Mr. *Hawes.*] In fact, having the manuscript, you would undertake to pay all other expenses connected with the publication?—Yes.

3761. Mr. *Elphinstone.*] You would undertake it in the same way that you do any other work that you now publish?—Yes; I should undertake the expense of it. I would not undertake to say that I would go on provided it should turn out a loss; but my own opinion is that it would not do so.

315

Mr. *Markham Sherwell*, called in; and Examined.

3762. Mr. *Hawes.*] You are well acquainted with Mr. William Upcott, and his collection of manuscripts?—Yes; I have known him these 20 years, and his collection very intimately.

3763. In the course of the examinations taken before the Committe last year the following question was asked of the secretary of the British Museum: "Did Mr. William Upcott ever offer to the Museum any collection of manuscripts?" The answer is, "A collection of autographs." The next question is, "Did the Trustees entertain his offer?" The reply, by Mr. Forshall, is, "I examined Mr. Upcott's manuscripts partially, and looked carefully through the catalogue of them; and the Trustees having heard my opinion on the subject of these manuscripts declined to give the price that was asked for them." By a subsequent question Mr. Forshall was asked the price, and he stated that there were two offers made to the Trustees; the first, for a portion of the manuscripts for 470 *l.*, and he thought 2,000 *l.* for the whole collection. Are there any observations that you wish to make upon that statement?—I am perfectly acquainted with the transaction as far as regards Mr. Upcott. A portion of his collection certainly was offered to the British Museum, and declined by the secretary in the name of the British Museum; and they were described as autographs only. Now that is not the character to give to them, because in the collection of Mr. Upcott there are a great many documents relating to the History of England, and State-Papers. The first answer that Mr. Upcott received upon the subject was in 1832, dated 10th December, by the following letter from the secretary of the Museum:—

"I am directed by the Trustees of the British Museum to acknowledge your letter of the 7th inst., and in reply to it to acquaint you that they are unable to enter at present into any negociation for the purchase of your series of State Papers. The Trustees desire me to thank you for the offer, which you have been so obliging as to make to them.

"I have the honour to be, &c., &c.,

"*J. Forshall*, Sec."

3764. Can you state the price that Mr. Upcott asked for them?—The price asked for a portion of them was 350 *l.*; that was refused, as is stated in a second letter written by the secretary, March 12, 1833. These State-Papers contained 21 volumes of the correspondence of the Messrs. Dayrolles, one volume of Henry Worsley's State-Papers, two volumes of Sir Leoline Jenkins's State-Papers, with the original Treaty of Nimeguen, which is a very curious document, and stated by Mr. Forshall, in his evidence (see minutes 1576), to have been one of the originals; of course every contracting party has an original treaty, but the original treaty, in the possession of Mr. Upcott, is the treaty belonging to the English Government; and I think it cannot be considered in the mere simple character of an autograph. It is complete, with the signatures of all the ambassadors.

3765. Is there any similar state paper in our State-Paper Office?—When Mr. Upcott went to the State-Paper Office, Mr. Lemon, senior, said he had it; but upon searching in the Archives it was not there; nor has it ever been in the State-Paper Office, because it has no official mark upon it, and Mr. Upcott is ready to prove whence he had it. It was found among the official papers of Henry Hyde, second Earl of Clarendon, and of Lawrence Hyde, his brother, the ambassador who signed the treaty (afterwards Earl of Rochester), which Mr. Upcott purchased many years since.

3766. Can you state the sum at which the whole collection was offered?—The sum was 4,000 *l.* It is stated in the evidence of last year that it was 2,000 *l.*; but by a letter, dated 12th July 1834, from the secretary of the British Museum, it is acknowledged that it was 4,000 *l.*; as appears from the following note, addressed to Mr. Sotheby, to whom Mr. Upcott entrusted his catalogue: "I have laid before the Trustees the catalogue of Mr. Upcott's manuscripts, and mentioned to them the substance of your communication to me, that Mr. Upcott was willing to take 4,000 *l.* for the whole collection; and I am directed to acquaint you, for Mr. Upcott's information, that the Trustees decline the purchase." There was at the time no catalogue existing, but a mere skeleton of a catalogue; and, since that time, Mr. Upcott has made the present printed one, which I hold in my hand.

3767. Was there a careful examination of these papers?—I am authorised by Mr. Upcott to say that Mr. Forshall came certainly to his house once, and staid

Mr. *M. Sherwell.*

17 May 1836.

staid a quarter of an hour or 20 minutes; but Mr. Forshall I believe is learned in topography, and seeing a very fine collection of drawings and engravings to illustrate the "History of the County of Oxford," he was very much captivated with them, and did not go into any examination of his autographs.

3768. Sir *Robert Inglis.*] Were you present at the time?—I was not.

3769. Mr. *Hawes.*] But this you have direct from Mr. Upcott?—Mr. Upcott, in conversation, has frequently told me so.

3770. You are intimately acquainted with the collection?—I have seen it from its infancy, and have at all times had access to it, because we have been so intimate; and having formed a large collection myself also it was natural that I should take a great interest in it.

3771. You have had an opportunity of seeing many similar collections of state papers, and manuscripts, and autographs?—Yes.

3772. Do you know any one more interesting, more curious, or more valuable in a literary point of view?—Certainly not; those gentlemen who possess collections, have all acknowledged that Mr. Upcott's is richer in diversified matter than any that they themselves possess.

3773. Is there not a very fine collection of the assignments of the works of celebrated authors?—There are 585 in all; and certainly those persons that have examined them closely, consider them a link in our literary history, because they show what the prices of manuscripts were in those days, compared with what they are at the present time; and certainly authors in those times got but badly paid.

3774. Were they examined by Mr. Forshall when he visited the collection?—I do not know. I have since learnt that these assignments were offered to the British Museum for 470 *l.*, but refused.

3775. Are there not some papers of considerable historical and national curiosity?—I have some here which I have brought with me.

3776. Will you state what they are?—I hold in my hand the original depositions, under their own hands and signatures, all endorsed by John Evelyn, relative to the secret marriage of Ann Hyde, and James, Duke of York. Now these certainly are very important papers, because much has been said upon the question of that marriage. The first is in the hand-writing of James, Duke of York, stating where, and how he was married. The second is from Ann Hyde, in her own hand-writing, upon the same subject. The third is in the hand-writing of Dr. Joseph Crowther, the minister who married them at Worcester-house. The fourth is by Thomas Boteler, Earl of Ossen, heir apparent to the Marquis of Ormond, who was witness to the marriage, and who gave her away. Here are two letters signed by Ellen Stroude, "servant to the Lord Chancellor's daughter," both testifying the fact of the marriage. Here is a letter connected with the subject; but it is unfortunately not signed, and is very difficult to know by whom it was written; but it is addressed to the King; so that there are six in all.

3777. Is there not rather a curious document in the collection, namely, the paper which was actually in Felton's hat when he stabbed the Duke of Buckingham?—Yes; when Felton was apprehended at Portsmouth, in 1628, in his hat was found this note, which has since been put into a small frame, as you see, to preserve it; it is a paper stating the reasons why he murdered the Duke.

3778. Sir *Robert Inglis.*] The early papers which you have exhibited to the Committee are papers from the Wootton collection?—They are.

3779. Which were delivered to Mr. Upcott, at the time he was in the house at Wootton, by the heir of the family?—By Lady Evelyn, the possessor of the papers.

3780. Mr. *Hawes.*] Is there not a letter also from the Queen of Sweden, relating to her abdication?—There is a folio letter of four pages.

3781. And a paper, giving an account of the landing of Perkin Warbeck?—Yes; it is signed by Sir Henry Wentworth, dated 16 September, 1497.

3782. What is the total number of letters?—Mr. Upcott has put into this catalogue 32,000 letters.

3783. And the general character of them is a literary one?—I should say so.

3784. Sir *Robert Inglis.*] When you say that the general character of them is a literary one, do you mean the Committee to understand that the collection as such is not one arranged in a great measure according to the rank of the parties. For instance, in page 38 here are 2,133 letters of the Peers and Peeresses of the United Kingdom, from the year 1780 to the present time.

There

There are 450 letters of baronets and knights; there are 763 powers of attorney, and warrants to receive South Sea Stock. In the next page there are 1,342 letters of nonconforming ministers; so that the whole collection cannot be considered as exhibiting letters, valuable either in a literary or political view, but rather—so far at least as the articles now pointed out to your attention by the present question are concerned,—as exhibiting a series of autographs?—Perhaps in those orders for South Sea Stock, there may not be literary matter; but because there are 2,000 letters from Peers, is it to be supposed that Peers are capable of writing upon literary matters, and that they certainly do contain, not only biographical notices, but historical facts and literary matter. I am certainly capable of saying this, because I have read many of them.

3785. Mr. *Elphinstone.*] Perhaps you would consider that they are rather historical than literary documents?—I should say both.

3786. Mr. *Hawes.*] You still retain your opinion that the general character of the 32,000 letters is, that it is rather a literary collection than any other; and that it is not to be considered as a mere collection of autographs?—Decidedly not.

3787. Have you any knowledge of an offer made to the Museum of Voltaire's works, with marginal notes, additions and corrections, by M. La Harpe?—Yes; an offer was made to the British Museum, by a letter of introduction from Mr. Upcott, of the whole of Voltaire's works, with marginal notes and corrections, by M. La Harpe. Mr. Upcott thought it would be a curious object for the British Museum, and Mr. Baber wrote an answer, without inquring anything more of them; and the British Museum declined the purchase. Here is Mr. Baber's answer.

3788. Will you read it?—"Dear Sir,—I have just had put into my hands a letter from you to Mr. Ellis, requesting to be informed whether the Trustees of the British Museum would be likely to purchase a copy of the Geneva edition of Voltaire's works, with M. La Harpe's manuscript notes, &c. As I have not seen the book, and, as no price is mentioned, I cannot answer your inquiry. The probability, however, is that the offer would be declined." Dated 22 June 1832.

3789. Was any one sent to examine the work?—No one.

3790. No inquiry or investigation took place?—None whatever.

3791. Sir *Robert Inglis.*.] The authority of M. La Harpe not being considered, it may be presumed, sufficiently high to justify the proposition of purchase?—It was supposed they were rejected, owing to the principles of Voltaire.

3792. Mr. *Hawes.*] Do you know the price that was fixed upon them?—From 25 *l.* to 30 *l.*

3793. Is it a fact that there are many foreign agents in England, buying up autographs and manuscripts, and collections of manuscripts and autographs?—Decidedly; I am acquainted with some that are doing so.

3794. La Harpe was rather a celebrated French author, was he not?—Decidedly.

3795. And his works are now considered valuable in France?—They are much read.

3796. In your opinion, as a collector of manuscripts and documents of this description, do you not think it would be much to be regretted should such a collection as Mr. Upcott's fall into the possession of any of those foreign agents?—I, as an individual, should regret it; and I hope the general feeling would be the same.

3797. Relating as it does in so great a degree to English authors and English literature?—Yes.

3798. Will you mention some of the English authors, the assignments of whose works are to be found in this collection?—Addison, for his Cato; John Gay, for his Fables and Beggars' Opera; Nicholas Rowe, for Jane Shore, witnessed by A. Pope; Goldsmith's Natural History of the Earth; Emerson, for all his Treatises on Arithmetic, and his Elements of Geometry; (many of these are not mere receipts but folio pages, stating all the particulars). Strutt, for his Dresses and Habits of the People of England.

3799. In short, you consider it a most rare and valuable collection of assignments?—Decidedly; there is no other such collection in England. Mr. Dawson Turner, of Yarmouth, has a very fine one; but he has often acknowledged that Mr. Upcott's collection is far superior, and that it ought to be preserved as a national object.

George Bellas Greenough, Esq., called in; and Examined.

G. B. Greenough, Esq.

17 May 1836.

3800. Mr. *Elphinstone.*] You are a Fellow of the Royal Society?—I am.

3801. You have been twice president of the Geographical Society, and three times president of the Geological Society of London?—I have.

3802. Do you consider that the Museum may be divided into three principal departments; namely, art, natural history, and literature?—Yes.

3803. With respect to the department of art, looking to the interests of the public, do you think it would be desirable or not that the works of art should be handed over to a different body, namely, to the Royal Academy, or to some separate institution of that nature?—There is a good deal of inconsistency in the existing arrangement; the national paintings are deposited at the Royal Academy; the national sculptures in the British Museum. No provision seems to have been made till lately, at either establishment, for objects of architecture; several such objects, the property of the late Sir Thomas Lawrence, are, however, now to be found in the British Museum; and others are expected from the collection of Sir John Soane. I think it is a fit subject for the consideration of the Committee, whether the national collection of architectural models and ornaments ought to be deposited at the British Museum or elsewhere.

3804. With reference to the arrangement of the marbles, do you consider that they are well arranged, or placed at a proper height above the eye?—It is a subject upon which I hardly feel competent to speak. I should suppose the best disposition to be that originally contemplated by the artist. In a paper transmitted by Visconti to the Institute of France, he states, on the authority of Tzetses, that two figures of Minerva having been exhibited at the same time to the Athenians, the one the work of Phidias, the other of one of his pupils, public opinion declared in favour of the latter; the work of Phidias seemed coarsely done, too deeply chiselled in some places, and wanting in that high finish by which the rival statue was distinguished. But when the statue of Phidias was placed in the position which it was originally intended to occupy, the skill of the master became immediately apparent; everything that had in the first instance appeared a blemish was now considered a beauty. Whatever the advantages were that the figures derived at the temple of Minerva, from the height to which they were raised and the mode in which they were lighted, these advantages must, I conceive, be entirely lost by the disposition adopted at the British Museum.

3805. Would you think it desirable that a collection of casts of busts and statues of the antique should be formed?—If it is intended that the British Museum should be a school of sculpture, then I think it desirable that it should be supplied with casts of all the first statues of Europe.

3806. With regard to seeing the sculpture by night; do you think it desirable to have it lighted up by torch-light?—I do. Artists are extremely desirous to view the statues at the Vatican by torch-light; and strangers who go to Rome, and have a taste for art, are generally recommended to see them under these circumstances.

3807. Has any injury ever occurred, to your knowledge, in the Vatican, owing to that permission being given?—I have never heard of any such injury.

3808. Do you consider the prints ought to be arranged in a public museum?—Prints may be considered in two different points of view; first, as objects of art; and, secondly, as objects of illustration. I think there ought to be two distinct collections.

3809. Are there two in the British Museum?—No, I believe not.

3810. Do you think a classed catalogue of prints desirable?—Yes; but I should prefer a catalogue with copious indexes, which would answer all the purposes of a classed catalogue.

3811. Mr. *Hawes.*] An index of authors names and subjects?—Yes, I would have both.

3812. And of the schools?—Yes.

3813. Mr. *Elphinstone.*] Do you consider that prints ought to be arranged like books, according to their subject, or according to the name of the engraver?—It is a matter of indifference how they are arranged in the first instance, if we have copious indexes.

3814. With regard to coins and medals; do you think they ought to be arranged upon the same plan as the prints?—Yes, I would carry the principle through every part of the Museum.

3815. Do you consider that lectures would be desirable upon subjects connected with the arts in the British Museum?—I think we must feel the pulse of the public. It is the duty of those that have the government of the Museum to take care that the public wants are supplied. The experiment of lectures ought to be tried.

3816. Mr. *Colborne.*] What did you mean by the paintings, under the care of the Royal Academy?—I understand that the paintings belonging to the National Gallery are to be now deposited in the same buildings as the Royal Academy.

3817. And under the same direction?—No; I understand them to be under the direction of the Trustees of the British Museum; but that, as far as the convenience of study goes, they may considered as an adjunct to the Royal Academy.

3818. Mr. *Elphinstone.*] You are understood to recommend that the paintings and statues and architectural models should be placed in one building, that the public may have an opportunity of seeing them and comparing them together?—The objects of the Museum are, in my opinion, too multifarious and complicated; on that account it would be better if broken up into three distinct establishments; these establishments might be contiguous, governed on the same principles; and they might even, on certain occasions, form a kind of federal body; each should be considered but as a whole, and not as a part of a whole.

3819. Will you mention what three establishments you would recommend?—One of art, one of natural history, and one of general literature.

3820. Mr. *Colborne.*] Then, do you mean that you would wish all the statues and sculpture to be placed under the direction of the directors of the National Gallery instead of under the Trustees of the British Museum?—No; I would not venture, in the present state of things, to propose what I think would have been right in the first instance. I think, in the first instance, it would have been right to have had a distinct establishment for art, comprising painting, sculpture, and architecture.

3821. But as there is no such establishment, under whose direction would you now leave them?—I think it is for the consideration of the Committee whether in the present state of affairs the national collection of sculpture should be at the British Museum, or mixed up with the rest of the British Museum, or be considered as a separate establishment.

3822. Are you aware that many of the works of sculpture there, have been devised by will to the Trustees of the British Museum?—I am aware of that circumstance; and I see no reason why Trustees of the British Museum might not be placed at the head of that separate establishment.

3823. Is not every facility afforded to students to study the sculpture?—I should say the absence of a large collection of casts was a proof that they have not every facilty.

3824. The question refers to the collection that is there now; is there any hindrance to students to visit them?—I believe every facility is given in that sense of the word.

3825. With regard to the prints; have the public a fair opportunity of seeing them, consistent with their safety?—I have little experience upon the subject, having rarely had occasion to consult them.

3826. Mr. *Elphinstone.*] But you are understood to state that you do not think the collection is sufficient for the wants of the public?—The collection of prints is a great deal too limited; I think that collection ought to be viewed in the same light as the collection of books, viz. as instrumental to the promotion of science.

3827. Sir *Robert Inglis.*] Do you know what is the extent of the collection of prints in the British Museum, and how high it ranks among the collections either of this country or of the world?—I do not; but I consider the collection of prints in the British Museum to have been formed principally, if not entirely, with a view to art, and not to illustration.

3828. Have you examined the collection with a view to the evidence which you are now giving, or do you speak from a general recollection of the contents of the Museum, without having made special reference to it for the present purpose?—I am not particularly acquainted with it; but I went to view them with reference to that point, and the impression I received was as I have stated.

3829. Do you happen to know the number of illustrated works which there are in the Print-room?—I do not; but, by illustrated works, I mean prints, illustrative

trative of objects of science. For instance, in natural history, I should wish to see all those prints of animals which are referred to in the works of such men as Cuvier.

3830. Have you tested the collection in the Museum by any such reference to Cuvier; and have you found any such prints wanting?—No, I have not.

3831. Are you aware of the collections of drawings in natural history lately presented to the Museum, by the bequest of General Hardwick?—No.

3832. Mr. *Elphinstone.*] Is there any catalogue of the prints contained in the British Museum, that you could either see there or have in your own house, which could give you the information referred to in the last question?—I have never seen any.

3833. Sir *Robert Inglis.*] You have referred to art in its three branches as constituting one general establishment into which you would desire the national collection to be divided, and you specified painting, sculpture, and architecture. In the collections in the British Museum, you find Egyptian antiquities, Etruscan vases, coins, medals and bronzes, [besides prints, which have formed the subject of the last question;] where would you place the Egyptian antiquities?—I should place them as objects either of antiquity or history.

3834. Would you have them in the British Museum, or transfer them, according to your theory of a perfect arrangement, to the department of art?—I consider that the governing body must determine to which department they belong.

3835. Do you see any objection to their being left where they are?—The only objection I feel is this, that complexity renders the government of the Museum more difficult. I think it easy to obtain a person who has a competent knowledge of natural history, or of art, or of any one department; but of these, it is not likely that those who govern the British Museum should be acquainted with so multitudinous a collection of objects as is there brought under their superintendence.

3836. The same answer would apply probably to the Etruscan vases, to the coins, medals and bronzes, and to the general antiquities?—I think so; I should leave their destination to be determined by the judgment of the governing power.

3837. You have referred to the difficulty of exhibiting to advantage the great works of Athenian art which are now in the Museum, and you have cited a passage in Visconti, from which the Committee draw the conclusion that you would recommend the removal of the Elgin marbles from their present position; would you recommend their removal to a position as high as that which they originally occupied; and, if so, can you state to the Committee whether that height were not about 48 feet above the ground?—I beg it to be understood that I do not recommend this; I state that, in my apprehension, it would have been better in the first instance if such an arrangement had taken place. As such an arrangement did not take place in the first instance, I am by no means prepared to say that it is worth while to make the alteration now. I think the present arrangement faulty; but the evil of correcting the fault might be greater than the evil of allowing it to continue.

3838. As studies of art; do you conceive the Elgin marbles can be placed to advantage at the elevation which they originally occupied, assuming that elevation to be about 48 feet above the level of the ground?—I believe it was once in contemplation to build a Parthenon in the open space opposite Northumberland-house. Had such a building been erected, I think those sculptures might have been placed there very advantageously.

3839. As a man of science, looking at the atmosphere of London, as well as the climate of London, would you recommend the exposure of the Athenian marbles to the open air, in an unprotected state?—Certainly not; they would have been in the interior of the building, not the exterior.

3840. Then that would be the Parthenon turned inside out?—Yes.

3841. Mr. *Elphinstone.*] Are you aware what is the best classed catalogue in existence. Do you know any good general classed catalogue?—The catalogue of Gœthingen I believe to be a very good one.

3842. Sir *Robert Inglis.*] You refer to the exhibition of the great works of art in the Vatican by torch-light; are you aware whether that exhibition is ever granted to artists as such, or whether it be not rather confined to the amateurs and strangers

strangers who visit Rome. Have you ever seen any artists working by torch-light in the Vatican?—No, I never have; it is always considered a favour.

3843. A favour, purchased at considerable expense by the individual stranger?—Yes.

3844. In point of fact the artist at Rome has no more advantage with respect to the exhibition of the works of art by the strong light of torches than he has in England?—My object was not to draw any comparison between the facilities given to artists at Rome and in England, but to point out facilities which I thought might be given without any disadvantage to artists here.

3845. Mr. *Elphinstone.*] It is your opinion, that, in order to study a fine statue, it may be done more advantageously by the strong light of a torch than by a common light, in order to throw the shadows out?—Yes, I conceive so; but I would not recommend torches; I would obtain light by other means.

3846. Without entering into the general question of the supreme board of management or government of the Museum, with respect to the Natural History department, do you think it would be advisable to have a committee of arrangement?—I think it would; not, perhaps, a permanent committee of arrangement, but an extraordinary one.

3847. In order to make the whole arrangement of the Museum uniform and regular?—Precisely.

3848. Will you state your opinion as to how presents or purchases should be disposed of when they first arrive at the Museum?—I think it would be advantageous to have a room for the reception of every object when it first comes to the Museum. I think it should be the duty of the officer to put a number upon it; to enter it in a general inventory, and then deliver it over to the respective curators, who should be answerable for it when so delivered.

3849. Mr. *Hawes.*] Would you leave that inventory open to public inspection at all times?—If not found inconvenient.

3850. Mr. *Elphinstone.*] You intend that there should be a chief curator at the head of each department?—Yes.

3851. Do you conceive that when the arrangement of specimens is once made by the curators, it should be altered lightly?—Certainly not; it should be made very difficult to alter it.

3852. Do you know of any change of arrangement in regard to the Greville collection of minerals?—The arrangement of the Greville collection was entirely done away with upon its arrival at the Museum.

3853. Do you think that change was desirable or not?—It was contrary to the strenuous recommendation of the ablest mineralogists in the country. I can refer to a paper sent in to the Trustees, signed by almost all the first mineralogists.

3854. Will you mention their names?—This is the close of a memorial which was sent to the Trustees: "We have always considered the Greville collection as deriving a peculiar value from the labours of the Comte de Bournon; and decidedly think that, by his assistance in the description and further arrangement of it, the scientific purposes which, as a national collection it is intended to answer, can alone be effectually accomplished." That paper is signed by Sir Abraham Hume, Dr. Babington, Dr. Wollaston, James Laird, M.D., Mr. G. B. Greenough, Mr. Smithson Tennant, Mr. Richard Chenevix, Mr. Robert Ferguson, Mr. Leonard Horner, Mr. William Phillips, Mr. Robert Bingley, Mr. William Allen the chemist, Mr. William Williams, Mr. Richard Knight, Mr. William Jacob, and Mr. Jonville, the French mineralogist.

3855. What is that document?—This is a document which was placed by these gentlemen in the hands of Mr. Rose, to lay before the committee of the Trustees of the British Museum on the occasion of the purchase and removal of the Greville collection.

3856. In spite of that strong recommendation not to change the arrangement, the arrangement has since been changed?—It has.

3857. As to the introduction of new names, do you consider that desirable or not in a public collection?—I think it is a great evil, more especially with regard to mineralogy; mineralogy has become a perfect jargon in consequence of the introduction of new names.

3858. In reference to the buildings for natural history, do you consider that the collections have been suited to the buildings in the British Museum, or the contrary?—

G. B. Greenough, Esq.

17 May 1836.

contrary?—I do not think the buildings suitable at all to the collection in the Natural History department.

3859. You think the building ought to suit the collection, and not the collection the building?—Yes.

3860. Sir *Robert Inglis.*] The building, so far as the natural history is concerned, is at present the eastern division, and in that division over the King's library is at present the mineralogy, the geology, the conchology, and the ornithology. Do you object to the rooms in which the ornithology is exhibited?—I have not paid particular attention to that.

3861. Or the conchology?—I do not consider the room at all convenient for the purpose.

3862. In what respect do you regard it as inconvenient?—I think this would lead me to a lengthened answer, which, with the permission of the Committee, I will postpone to a subsequent part of the examination.

3863. Mr. *Elphinstone.*] Do you think it would be desirable to have perfect catalogues of all the objects in the Natural History department?—Certainly.

3864. Have you any opinion to offer as to the manner of forming these catalogues, or as to the way in which they should be made?—It is difficult to give a general answer; we must consider the particular case, and what is the object to be attained; some rules, however, may be laid down of general application.

3865. What are those general rules?—Catalogues should be drawn up as far as can be done conveniently in a tabular form, the fewer words used in a catalogue the better. Words of the same order should be written in the same character, and be made to range in a vertical line. The name of a genus should have a large initial, and of a species a small initial. The name of the author of the genus or species should be placed against it in small letters or abbreviated. In the first pages of every catalogue an account should be inserted of the system on which it is constructed, the name of the author and the date. Catalogues should in general be accompanied by indexes, and sometimes by glossaries. All catalogues in the same establishment should be printed on paper of the same size, and in the same type. Important words should be distinguished by being written in a distinct character. These are general observations; when you come to particulars you must consider what the object is, and then you will know how you may best attain it.

3866. Mr. *Hawes.*] In your opinion, should the catalogues be printed?—Yes; and in respect to natural history there should be two catalogues; the one popular, and the other scientific.

3867. At all events, whether printed or not, they should be accessible to the visitors, whether a scientific visitor or one of the public going from mere curiosity?—Certainly.

3868. Mr. *Elphinstone.* Into what subdivisions would you divide the department of Natural History with regard to the administration?—I would divide the department of Natural History into four sections, zoology, botany, mineralogy, geology; and for the administration of the Museum, I would subdivide zoology into the vertebrata, mollusca, articulata, radiata. To each of these sections I would attach a curator, an assistant, and an attendant; and I would allow, and recommend, every curator to take pupils. I would further establish a series of lectures and demonstrations in natural history; and if these lectures were well attended, I would eventually give to the lecturers the title of professors. In the first instance, these persons would not be regular officers of the Museum, and they should be entitled to no further remuneration than they derived from those who attended their course. The pupils of the curators should be entitled to attend gratis, and certificates of their proficiency should be given to them on leaving the Museum. The lecturer should be free to adopt, in his own syllabus, whatever arrangement he pleased, but should have no power to disturb that which the curator, with the sanction of the governing body, had established. To the Natural History department I would further attach, first, a library of books, and prints, and drawings, similar to that at the Jardin du Roi, which contains 12,000 vols. and 64 vols. of figures of plants and animals, drawn and coloured on vellum; secondly, a draftsman for natural history, and a drawing-school, to pay its own expenses; thirdly, a reading-room for natural history; and, fourthly, a study and store-room, or laboratory, for each curator.

3869. As to the department of zoology, properly so called, can you state

about

about the number of specimens that there are now in the Museum, and also the number of existing species of animals, in order to show the wants in that department?—I have here a paper, taken from Swainson's published works. Of the mammalia, there are 950 genera described; and there are, as I understand, 500 of those in the Museum. Of the birds there are 6,200 species described, and there are 2,000 in the Museum. I do not state this of my own knowledge. Of the reptiles, 908 have been described; and there are 926 in the Museum; so that there are more in the British Museum than have yet been described. Of fishes, 4,000 species have been described by Cuvier, and if you add to those the species described by others, they may be taken as 6,000; there are 1,000 in the Museum. The whole number of mollusca described by Lamarck, recent and fossil, is 4,200. The Museum now, I believe, contains 4,000. I have taken this from the evidence. I think one of the persons examined stated the number in the Museum to be 3,334. In regard to the articulata, my authority is Herschell, he reckons from 80,000 to 100,000 species.

3870. How many are there in the Museum?—I do not know. Of the echinodermata, recent and fossil, there are 272 species; and in the Museum there are 181 recent. I do not know how many fossil. There are 5,010 recent and fossil polypifera described; and in the Museum there are 380 recent, and 150 sponges. The number of plants known has been stated at from 80,000 to 100,000 species. I cannot tell how many there are in the Museum. I have here another table, drawn up by Professor Rudolph Wagner, at Erlang, published in Jameson's Journal, July and October 1833. In it animals are divided into recent and fossil; mammalia, 120 fossil, 1,100 recent; birds, 25 fossil, 6,500 recent; amphibia, 50 fossil and 1,500 recent. The number of fossil fishes is stated to be 250, but I believe Agassis has brought it up to 850, and 7,000 recent.; the mollusca, 3,100 fossil, and, I believe, 5,000 recent; the crustacea, 100 fossil and 1,500 recent; insects, 150 fossil and 50,000 recent; the radiata and the annelides, 350 fossil, and 280 of the one, and 315 of the other, recent, making 595; the zoophytes, 500 fossil and 536 recent; the medusaria, 208 recent, there are no fossil mentioned; the rotatoria 119 recent, and infusoria 291. It will give an idea of the enormous extent of natural history, when I state that the population of the world being 657,000,000 of human beings, there are 577,600,000 species of animals.

3871. Sir *Philip Egerton.*] In these calculations have you included the entozoa?—No, I have not; this is merely a copy from Swainson's book. The Committee will now understand why I wish to separate the department of Natural History from those of art and general literature. If the collections were complete, no building could by possibility hold any one of them.

3872. Mr. *Elphinstone.*] Have you any general observations to make respecting the state of the Natural History department?—I am not aware of any observations.

3873. Have you turned your attention as to whether it would be desirable to incorporate the Linnean Society in any way with the Natural History department?—I think it might be done, with advantage to both; but I am by no means confident upon that subject.

3874. As to visitors being appointed; would that be desirable?—I think very desirable.

3875. By whom should those visitors be chosen?—In the first instance, I think, by the Government.

3876. How many visitors would you suggest?—I would propose 50.

3877. Have you any remark to make respecting any other subdivisions of the Natural History department, namely, either botany, or mineralogy, or geology?—In regard to mineralogy, I think it desirable to establish a lectureship of mineralogy, if that could be done conveniently; at least the experiment ought to be tried. In regard to geology, there is scarcely anything at the British Museum, independently of the fossils. The following collections are wanting: a collection of rocks, arranged mineralogically; a collection of rocks, arranged economically; a collection of rocks, arranged topographically; a collection of rocks, arranged chronologically, or according to position; a collection of concretions; a collection exhibiting passages from one rock to another; a collection of artificial, and volcanic and epigenic productions; a collection of sunstones, and a collection of junctions.

3878. Do you consider that the geological collection at present is worthy of

a public institution?—It scarcely exists; there is scarcely anything worthy of the name.

3879. With regard to the mineralogical collection; what is your opinion of it?—It is exceedingly fine.

3880. Are you acquainted at all with the botanical collection?—No.

3881. *Chairman.*] Have you any general observations that you wish to add with reference to the Natural History department?—A distinct library of natural history would be of great advantage; and the Museum is very deficient in works on topographical geology, to which I attach great importance.

3882. Sir *Philip Egerton.*] In your last answer you stated that, in your opinion, a library of natural history would be of great advantage; are you aware of the existence of the Banksian library?—I am.

3883. In what light do you consider that?—So far as botany is concerned I have no opinion to offer; but it is extremely defective in works of topographical geology; and geology in general.

3884. In that answer, would you wish to imply that a more perfect library of natural history would be desirable?—Much more perfect.

3885. Mr. *Elphinstone.*] You wish that in each subdivision of the Natural History department there should be a separate collection of books for the use of that subdivision?—A separate collection for each of the three establishments; and each collection should be complete in all its subdivisions.

3886. Mr. *Colborne.*] In reference to all the collections you have mentioned as desiderata, and in reference to giving lectures, have you ever estimated the probable expense of all these suggestions?—I have not estimated the expense, but I have considered that the public were entitled to expect in England all the advantages which are afforded to them at Paris. I see no reason why England should be behind France in any of the advantages which such an establishment as the British Museum is capable of affording.

3887. Your objection is not so much to the mismanagement of the funds as they now exist, but to the want of adequate funds to carry these enlarged views into execution?—I do not object in the slightest degree to the disposition of the funds; I only point out advantages which the public have not at present, and which I think they are fairly entitled to expect.

3888. Mr. *Elphinstone.*] You stated that you thought there should be a study, or store-room, for each curator; will you state your ideas generally respecting the Museum buildings?—I do not think that the rooms are convenient; the curators all want more accommodation than they at present possess.

3889. As to the arrangement of the different galleries; do you approve of the present arrangement?—I think the form of a cross or transept would be better. It is a form that I see at Leyden and at Frankfort, and at different collections, and I find it exceedingly convenient.

3890. As to the fittings of the different collections; do you consider that the different trays in the drawers are as economically and conveniently arranged as they might be?—Yes, I think the trays are as convenient as possible; but I consider that in such an establishment the dimensions of every case and cabinet should be so regulated, in respect to the recesses and apartments, as to be multiples or sub-multiples of one another, so that every case or collection of cases moved from one room to another would fit accurately its new position. I should act upon the principle adopted in the mail-coach establishment, that every nail and every pin should fit one coach as well as another.

3891. Have you carried out that principle in your own collection?—I have; and I have found it answer.

3892. Sir *Philip Egerton.*] Do you assume that that is not the case in the British Museum, or do you know that it is not the case?—I know that it is not the case. I am speaking of the building; I am not speaking of the trays nor the cabinets of the mineral collection only. In regard to that room, I think it would be a great accommodation if there were a few stools placed under those cabinets, that people might sit down occasionally; and perhaps a slab or a table might be of service; and instead of having so many naked walls, I should like to see those walls completely covered with synoptical tables, maps, drawings, or plans; geological maps more especially.

3893. Relating to the objects in the room?—Relating to the objects in the room.

3894. Mr. *Hawes.*] Do you think it is sufficiently lighted?—The light is sufficient, but it is badly disposed; there is so much reflection in every part of the mineral-room that it is painful to look into the cases.

3895. Have you ever been in the private room of the keeper of the mineralogical collection?—I have.

3896. What do you think of the light afforded to him for his studies there?—I think it is desirable that he should have a side-light; it must be difficult to measure a crystal, for instance, in such a light as he has. I think he also ought to have a laboratory, where he might test minerals.

3897. In fact, that the architect should adapt the building expressly for the collection which it is intended to exhibit?—Yes; I should imagine also that there would be a good deal of inconvenience in packing and unpacking, where you have a room of such immense length as that appropriated to the minerals.

3898. Generally, do you consider it desirable that the head curator of each department should be consulted as to the arrangement of the rooms before they are built?—Certainly, of great importance.

3899. Therefore you would consider it a proof not of good management, if the rooms were built without the different officers of the departments being consulted?—When I consider how very extensive the different series must be, and what an enormous space must be required for such collections, if they are to be perfect, I must regard space of the greatest consequence; and if the room is of greater height than is required, I think there is a profuse expenditure. I would also make this general observation, that as collections of every kind are constantly on the increase, and as it is known beforehand that they must be so, provision ought always to be made for this increase when buildings are erected, and consequently that the design of the artist ought not to be regular and uniform, but to be capable of being extended. That principle has been acted upon at the Jardin des Plantes, and at the best establishments in Europe. If you can neither raise the building nor extend it, in consequence of the nature of the architecture, you are exposed to a very serious inconvenience.

3900. Sir *Robert Inglis.*] In one of the late questions it was implied that the curators of the different departments had not been consulted by the architects: can you state to the Committee anything from your own knowledge upon this subject, as to the fact whether the curators were or were not in communication, direct or indirect, with the architect?—I have no means of proving a negative from my own knowledge. I cannot say anything upon the subject; it is very easy to obtain that information from the curators themselves.

3901. Mr. *Hawes.*] Have you looked into the Appendix of the evidence of last year?—I have.

3902. Have you seen the account of the sums spent upon the buildings of the British Museum?—Yes; but I have not paid particular attention to it.

3903. It appears from that account that the total of the sums paid upon the old and new buildings from the 5th of January 1831, to the 31st of March 1833, amounted to 227,665*l.* Are you of opinion that the public has all the advantages which might fairly be expected from the outlay of so large a sum for the purpose of exhibiting the collections of the Museum?—I think not; and I may observe further, that the plan of the new buildings will lead to the sacrifice of a room which cost 30,000*l.*, that in which the Townley marbles are deposited.

3904. Mr. *Elphinstone.*] As to the reading-room; do you think it desirable that it should be open in the evening?—I think it very desirable that a reading room should be open in the evening. Of course every precaution must be adopted against fire; but it is easy to have a room where there should be no such danger. I believe the King's library would with very great difficulty be set on fire.

3905-6. If a room were constructed exterior to the main building of the Museum, there would be no disadvantage in the public being admitted in the evening?—I see no other than the great expense of maintaining additional officers.

3907. Mr. *Hawes.*] You think that the present buildings require extensive alterations to meet the wants of the collections?—Yes; but it would be difficult to make them now.

3908. And that is an evil which has arisen mainly from the want of the arrangements being made subservient to the judgment of the curators, and the interests of the collections generally?—I think it is owing to the objects of the Museum being too indefinite. I do not think the persons who have had the management of the Museum ever entertained any distinct idea as to its objects; they have left too much to chance; they have not proceeded upon a regular systematic plan.

3909. Sir *Robert Inglis.*] Does your answer refer to the formation and completion of the collections, or to the arrangements of the collections when formed?—I speak of the history of the Museum, from its first establishment down to the present time. I do not think the objects of the Museum have at any period been distinctly defined; and I consider such distinct definition to be exceedingly necessary in such an establishment.

3910. The British Museum at present is a grand depository of objects of art, natural history, and literature; the Committee understood that you wished to subdivide the collections into three great establishments; and, so far as the sciences comprehended under the term "natural history" are concerned, and possibly with respect to other departments also, to connect lectures with them; in other words, to change its character from a depository to which students or amateurs, or casual visitors may resort for the purpose of working out instruction by their own labours, into a place of education, in which professors salaried by the nation may, at the public expense, convey instruction. Have you formed any estimate of the extent of the *locale* which would be required, or of the expense which would be involved in the completion of the plan to which you have called the attention of the Committee?—I am afraid that I have been misunderstood by the Committee. That is not what I mean. I stated expressly that the lectures were to be considered merely as a matter of experiment; and further, that the lecturer was to be remunerated by the fees of the pupils; and that there was to be no expense attending them. That the pulse of the public was to be felt; and that if it was found, upon inquiry, that the public felt that lectures were wanted, it would be the duty of the governing body to provide them, and not otherwise.

3911. Mr. *Elphinstone.*] With regard to lectures; do not you think that the curator lecturing is a guarantee to the public that he is acquainted with the subject of his particular department?—Yes; but I think the curators are all fully occupied with their present duties; they are over-worked.

3912. There would be no reason that the students should be interrupted in studying the collections in the Museum, if lectures were given, because a separate lecture-room might be provided, as is done in the Jardin des Plantes, at Paris?—Yes, I should proceed upon the same plan as in the Jardin des Plantes; the lectures would probably be given early in the morning; but I see no reason why the British Museum should not be made as useful to the public as the establishment at Paris; and as lectures are given there, I see no reason why they should not be given in the British Museum. I think it the more desirable, because no similar provision has yet been made in the country for the study of natural history.

3913. Sir *Robert Inglis.*] Will you state what, in your view, are precisely the objects to be contemplated by the existing system of the Museum?—I do not know; my complaint is that the objects are indefinite. I wish them to be made definite; and my observation had no other bearing than to render the Museum as useful as possible.

3914. *Chairman.*] With reference to lectures; you say that the pulse of the public should be felt as to the institution of lectures; and that if it is found that the public require them, it is the duty of the Museum to furnish those lectures. Do you mean that, under the improvements you contemplate, it would become the duty of those who had the management of the Museum to institute such lectures, or do you think it is a mark of negligence or of inattention to duty on the part of the Trustees, the not having instituted such lectures?—I attach no blame to the Trustees; they have acted upon precedent, and have gone on as their predecessors did before them; but I think that men

327

in their situation ought to meet the wants of the times; and that they ought to be continually endeavouring to make the establishment more useful.

3915. Do you find anything in the constitution of the Museum which leads you to suppose that it ever was in the contemplation of those who were the founders of the institution, or of those that had the management of it in after-times, to institute any lectures of the character you have adverted to?—No, I am not aware that it ever has been in their contemplation. I regret it.

3916. Therefore you would recommend an alteration or an improvement to be made in the institution, which would make it feasible to establish the lectures, which you think would be desirable in case the public sought for them?—I think very little more is wanting than a *locale*. I think there are a great many persons who would be willing to give lectures.

3917. All that would come under the state of improvement which you contemplate?—I suggest this as a means of rendering the Museum more useful than it hitherto has been. I think it would be of great advantage to the Museum to train up a number of students in natural history, so that, if any appointment were vacant in that department, you might at once have able men to supply the vacancy.

3918. Mr. *Elphinstone.*] Considering the object of the Museum to be not merely the gratification of curiosity, but the advancement and diffusion of sound and useful knowledge, in what power would you vest the future government of the Museum?—In giving my answer, I speak as to what I consider the best system, without reference to the present constitution of the Museum. There are at present a certain number of Trustees; some of them appointed for life, and some official. Now, not taking the present constitution into account, I would place at the head of the establishment a man of a certain rank in society, of enlarged mind and extensive acquirements, of popular manners, of sound judgment, conversant with science and literature; a man qualified for the situation of president of the Royal Society, or principal of the Metropolitan University, or minister (if minister there were in England, as in France and Prussia), of public instruction; of course he would receive a liberal salary.

3919. Then do you propose that there should be a council, with a person, with the title of president, at the head of it?—I do.

3920. Of what other persons do you propose that the council should consist?—I would have 50 effective visitors, and out of those I would select one portion of the council.

3921. How many members would you make the council consist of?—Besides the president, there might be vice-presidents, a secretary, and a warden; the title of warden designating, more clearly than that of principal librarian, the duties that are at present discharged by Sir Henry Ellis. Also an accountant, or permanent auditor of accounts, and 10 members of council, selected from the body of the visitors and the curators of the several departments.

3922. By whom would the members of council taken from the body of visitors be selected?—I would have the 50 visitors, conjointly with the council, form a general annual meeting, which would fill up the vacancies in the council.

3923. In the first instance, before the council is appointed, 50 visitors would be named by the Government; how do you propose that the council is to be elected out of that body of visitors?—The Government would first nominate 50 visitors; from those 50 visitors a certain number would be selected to sit in the council.

3924. By whom?—They might be selected by themselves; or if you had a president such as I have described, that president ought in the first instance to form a house-list, to be submitted to the visitors and such officers of the Museum as shall by virtue of their office be considered members of the council.

3925. What visitors do you propose not to be elective?—The family Trustees would sit without being elective.

3926. Then you would retain the present family Trustees, and sweep off all the others?—I would.

3927. Then do you suggest that a board of 50 visitors should be appointed by the Government, and that they, along with the family Trustees and the principal officers of the Museum, should elect, at an annual general meeting, a council for the general government of the Museum?—Yes, those were my ideas; now, in reference to the visitors, I conceive they would be selected as follows: I would

G. B. Greenough, Esq.

17 May 1836,

would say the 10 family Trustees; 10 persons of rank and habits of business, but who do not now hold official situations in the State; 10 members, from societies engaged in the cultivation of natural science and natural history; 10 members from the Royal Academy; and 10 members from the Society of Antiquaries and the Royal Society of Literature, that would make 50 persons; out of those 50 persons, and the principal officers of the Museum, I would select the council. In framing a list of visitors, I should endeavour to make such an apportionment that no branch of knowledge would be unduly favoured or neglected.

3928. Having so formed the council as you propose, what would you do; would you appoint a special Committee to draw up instructions for the different officers of the different departments?—It would be for the president and council to do that under ordinary circumstances; but, in order to make the whole arrangement of the Museum uniform and regular, I have before recommended, as applicable to the present time, an extraordinary committee of arrangement; the committee would be very small, and consist exclusively of individuals of great practical experience in duties of this nature.

3929. What would be the duties of the council?—The ordinary duties of the councils of scientific societies, the general management of the establishment.

3930. What would be the duty of the president or warden?—I consider him in the light of the executive; it would be his duty to see that the orders of the council were obeyed; it would be his duty to see that a proper visitation were made of every part of the establishment annually, and, upon an uniform principle, to make the institution as useful and effective as possible; to be the regular organ of communication with Government; to observe the working of the several departments, and suggest improvements in their organisation; to direct all the correspondence of the Museum, foreign and domestic; to consider all applications for grants of money recommended by the visitors or by the annual general meeting, and report his opinion thereon to the Secretary for the Home Department.

3931. Do you think the council should require annual reports from each department?—I think the visitors should divide themselves into sub-committees, who should give in detailed accounts of the state of every part of the establishment, for consideration and discussion at the general annual meeting.

3932. Would you have these reports made public?—At all events they might be called for by the House of Commons, or by the Secretary of State.

3933. As to the present official Trustees, do you consider it desirable that there should be official Trustees in a public body of that sort?—I do not see any advantage in official Trustees.

3934. Mr. *Hawes.*] Is it not also an objection to Trustees of high official rank, that they should have great official duties?—I think so.

3935. Must it not prevent their coming into that frequent contact with the officers of the institution, which it is essential for the governing body to do?—Such will be the case, generally. I believe the late Mr. Abbot, when he was Speaker to the House of Commons, was constant in his attendance; but that is a very rare instance.

3936. Could a governing body, such as the present is, come into contact frequently with the officers, so as to enable them to act conjointly in the improvement of the institution?—I should think not.

3937. Do you think the Museum can be well administered when the keeper of the Natural History department, Mr. König, informs the Committee that he has never been consulted by the Trustees with a view to improve the collection under his care?—I should certainly think he ought to be consulted, and that continually, with regard to his department.

3938 Do you think the administration of such a Museum can possibly be so beneficial to the public as it ought to be, keeping in mind the annual expense incurred by the public?—I have already said that it is capable of great improvement.

3939. Sir *Robert Inglis.*] Are you aware whether Mr. König have made regular reports to the Trustees, as, by the rules of the institution, it was his duty to do; and whether such reports have or have not been duly received and considered by the Trustees?—I believe that to have been the case; but I have no knowledge of the fact.

3940. Then, although in point of fact there may have been no direct *viva voce* communication, the terms of the question imply, and your answer admits, that there

there may have been, and probably was, a regular intercourse by written report?—I have no knowledge upon the subject; but my general impression is this, that it would be thought presumptuous in the curator to give opinions, when he was not desired to give them.

3941. One of your last answers stated that you believed it was the duty of the curator, and the practice of Mr. König, to make reports to the Trustees?—My belief is that Mr. König has been in the habit of making reports to the Trustees, it being his duty to do so.

3942. Are you aware of the general rule in the statutes addressed to all the curators, namely, that "In framing these regulations the Trustees are aware that it is impossible for them to define the duty of each officer with a sufficient degree of precision for all possible emergencies; in addition therefore to the above rules, it is to be considered as a general instruction to the several officers, that they conduct themselves as becomes men of honour, integrity and liberality, in the conscientious discharge of the duties of their respective stations, and as men who have the credit and utility of the institution truly at heart — in reference to the last clause of the statute now read to you, and believing Mr. König to be a man who has the credit and utility of the institution truly at heart, would you not suppose that he would regularly make his reports; and that those who framed the statute would, as in duty bound, be willing to give to such reports the attention due to them?—My belief is, that an officer so circumstanced, would consider it his duty to be obedient to the orders he received; and that he would not dispute the propriety of those orders, nor presume to give any opinion at variance with the opinion of the governing body; and that he would consider himself not as a part of the government, but as a person employed, and regard obedience as being his duty.

3943. Is not something more than obedience implied as a duty, in the paragraph last read to you, in which the officer is instructed to act as a man that has the credit and utility of the institution truly at heart, and therefore would feel himself bound to make any representation which the utility and credit of the institution would require?—Were I in that situation I should not presume to give opinions to the Trustees at variance with their own.

3944. Do you know anything of the fact whether Mr. König have or have not made any such representation?—I am not aware of any distinct case; I have heard that Mr. König has at times made suggestions to the Trustees, and that their opinion has not agreed with his.

3945. Mr. *Hawes.*] You have been asked a question with reference to a regulation which is part of the statutes in the Museum. Now it appears by the evidence of last year, that Mr. Gray was not even aware that such a regulation existed. Do you not think that the Trustees ought, if they mean the officers and assistants to be guided by the regulations, to take care that they are duly informed of them?—I should think so.

3946. Mr. *Elphinstone.*] It appears that there is one annual visitation made by the present Trustees. Do you conceive that in one day they can sufficiently visit so large an establishment as the British Museum, to do justice to the public interests?—I think it is impossible, in that space of time, to go through an effective visitation; they must take a great deal on trust; they cannot have time to look carefully into the establishment.

3947. Then it is to be collected from the evidence you have given, that you think that the constitution of the present board of Trustees requires amendment?—I think so.

3948. Are you aware which is the largest apparatus, that for governing the British Museum, or that for governing India?—That for governing the British Museum, I think.

3949. Have you any other observations to make to the Committee?—In looking over the evidence, I observe that one of the gentlemen gives it as his opinion that the arrangements of the British Museum ought to keep pace with the progress of the sciences, and that changes ought to be made in the arrangement as science advances; so that it may serve as a model to the institutions of the country. I do not agree in that opinion; I think there is great advantage in the permanence and stability of a system, and that we should be exceedingly cautious in endeavouring to keep the arrangements up to the progress of science.

3950. Do you refer to the nomenclature?—Both to the nomenclature and the

G. B. Greenough, Esq.

17 May 1836.

the arrangement; I think it is of much more consequence that the arrangements should be permanent than that there should be slight improvements made in them continually.

3951. Mr. *Hawes.*] Some reference has been made to the written communications made from time to time by the officers of the Museum to their superiors, the Trustees. Now if the communications were effectual for their end, namely, the benefit of the Museum, could such a state of things exist as is indicated in the question and answer which will now be read to you. The following question is put to the keeper of the Natural History department: "Have they," that is the Trustees, "ever made any enquiries of you with a view to improve the collection under your care?" The answer is, "I do not remember to have been consulted upon that subject?"—I think the curators ought to have ready access to the Trustees; I should apprehend, from the answer, that this is not the case.

3952. Do you think they ought to be kept standing before the board of Trustees?—I should say not.

3953. Sir *Robert Inglis.*] Are you aware whether the curators have opportunities of recommending purchases to the Trustees, and whether such recommendations are or are not attended to?—There are many of those points upon which I can only speak from common report, and the general impression out of doors. I can quote the instance of the Corsi collection of antique marbles; the purchase of that collection was recommended to the Trustees, and declined; it was immediately afterwards bought at an advanced price by an individual, and by him presented to the University of Oxford. I understand that it was felt desirable in the Museum that there should be an economical collection of minerals formed.

3954. Mr. *Hawes.*] It was implied in the question just put, that the Trustees were disposed to attend to the recommendations of their officers. You are now referred to a portion of the evidence given last year, and your opinion is asked upon it, which is to this effect: "Do you know anything of a collection that was offered by Mrs. Noel?—Yes, a very splendid collection; in fact, it was a selection, in 10 large boxes, of the insects of Brazil, certainly the finest collection of Brazilian insects I ever saw; the 10 boxes were offered to the Trustees for 100 *l.* By permission of the Trustees I had the selection of one box, for which Mrs. Noel charged 14 *l.*, and they were purchased by the Trustees. Did you deem it a valuable collection, and one most desirable to obtain?—Certainly. Did you deem the sum reasonable that was asked?—Very reasonable. Did you ever make known your opinion upon that subject in any way to the Trustees?—I strongly recommended it to the Trustees as being the finest collection and selection of specimens I had ever seen from the Brazils. Can you state why they were not purchased?—No." So that here is an instance of a recommendation made and not acted upon, without the slightest communication made to the officer why his recommendation was not agreed to?—I do not blame the Trustees for any act of this description. The sum voted by Parliament is limited; and it is for the consideration of the Trustees in what manner that sum may be best applied to the general interests of the Museum. I think the Trustees are fully at liberty to exercise their judgment as to making purchases or declining them without assigning any reasons to the curators.

3955. The evidence goes on to this effect: "Was any communication held with you upon the subject?—None whatever. Were you called in by the Trustees to be consulted?—No." Do you think that such a course is likely to engender good feeling between the Trustees and the officers under them?—The curators are very deserving officers, and great respect ought to be paid to them.

3956. Sir *Robert Inglis.*] The instance to which your attention has been called is an instance in which Mr. G. Samouelle is the party giving evidence; are you aware whether Mr. Samouelle be, in the strict sense of the word, an officer of the Museum, making reports directly to the Trustees, or whether he be an extra assistant in the Natural History department, who, according to the existing regulations of the institution, would communicate with the Trustees through the chief of his own department?—I should imagine it would be through the chief of his own department that he would communicate with them, according to the present system; but I think the organisation of the Museum very defective.

3957. Mr. *Elphinstone.*] The Entomological collection being entrusted to Mr. Samouelle, would it not be desirable that he should have the means of communicating directly with the Trustees without having to go through the intervention of a third person who probably knows nothing about the matter?—So long as he holds his present situation I think he can communicate with the Trustees only through the medium of the chief officer of the department.

3958. Sir *Robert Inglis.*] When it is said that the intervention is through a third person who probably knows nothing about the matter, do you know who the chief of that department is, and do you state that he is a person who probably knows nothing of the Entomological department?—I do not know the extent of Mr. König's knowledge of that subject; but I cannot imagine him ignorant of any department of natural history; he is an exceedingly good naturalist.

3959. Mr. *Elphinstone.*] The Museum is now closed on Sunday afternoons and on public holidays, would it not be better for the public that it should be open at those times?—That is partly a question of expense, and partly a question of public feeling. It no doubt would be an advantage to a great number of persons if they had an opportunity of going to the Museum on those days.

3960. Have you any suggestions to make to the Committee with reference to classed catalogues?—The term "classed catalogue" is employed in different senses. All catalogues are classed in one way or another; that of the Museum is classed alphabetically, according to the names of the authors; and this is found, I believe, the most practically useful classification. If to such a catalogue be superadded copious indexes of persons, plans and subjects, I believe every purpose would be answered which those who recommend class catalogues would desire. An index of subjects is most important; without this every writer is under an apprehension that what he is about to do others may have done before him. Such an index brings at once under his eye works of which he previously did not know the existence. In regard to classed catalogues, if that plan be adopted, I consider that if the classes are few in number no great inconvenience can result; perhaps it would be possible to make about 20 headings sufficiently distinct. The number might be extended a little further; but I conceive such a classed catalogue as that of which an example is given in the Appendix of the Report of last year, that of St. Petersburgh, would lead to inextricable confusion; though it looks very well on paper.

3961. Do you know any practical difficulty in making the indexes to which you refer?—No; I am in the habit of making indexes in every department. I apply the same process to fossils and shells, and maps and prints. This is the general catalogue of my books (*producing the same*). I think it is convenient to have the name of the author large, and to have similar subjects classed in line, in that manner: this is the catalogue to my minerals (*producing the same*). I have Europe, divided into provinces; then, under the head of Yorkshire, I find all the specimens which I have from that part of the world. I have specimens with those numbers; then by referring to the general catalogue I find there an entire description of the substance, with remarks by whom and when collected, where described, figured or referred to, and from what place it comes, in what parish that place is situated, in what county it is, to what formation it belongs, in what cabinet the specimen will be found, and into what drawer. With respect to arrangement, there is one remark which I will beg leave to make. In the Museum it is usual to adopt some accredited system, say that of Lamarck at the outset, and afterwards to deviate from it, so as to make it square with the ideas of the curator. I think it would be better that the curator's improvements should appear, for some time at least, only in print, and not be introduced into the cabinets, where they often tend to confusion.

3962. Sir *Philip Egerton.*] What would you do where a genus of Lamarck's is discovered to contain two genera?—I think genera are often unnecessarily multiplied.

3963. Where there are two animals, with very marked differences of structure, inhabiting shells apparently of the same form?—Where there is good reason for increasing the number of genera, it should be done in the way I have stated; it is only after the interval of years that I would break up any existing arrangement in deference to newly-formed genera. The evils resulting from too fre-

G. B. Greenough, Esq.

17 May 1836.

quent changes of arrangement cannot be pointed out more clearly than by referring to Mr. König's account of what has taken place in his department.

3964. Mr. *Elphinstone.*] Should you see any difficulty in the principles of your own catalogues being applied to a national collection?—I think there is no difficulty in forming a system, but it requires a great deal of vigilance and perseverance to keep it up.

Jovis, 19° die Maii, 1836.

MEMBERS PRESENT.

Mr. T. G. B. Estcourt.	Sir Robert Inglis.
Mr. Thornely.	Mr. Hawes.
Sir Philip Egerton.	Mr. Marshall.

MR. T. G. B. ESTCOURT, IN THE CHAIR.

Mr. *John Holmes,* called in; and Examined.

Mr. *John Holmes.*

19 May 1836.

3965. Mr. *Hawes.*] WHAT situation do you hold in the British Museum?—That of assistant in the Manuscript department.

3966. Will you describe your duties?—Generally to act under Mr. Forshall's instructions; the duties consist in forming catalogues of the manuscripts.

3967. What are the hours of attendance?—From 10 till 4.

3968. Were you required to produce any qualification for your office?—None; I consider the manner of my appointment honourable alike to Mr. Forshall and myself. We were personally unacquainted. I had compiled a catalogue which came under Mr. Forshall's notice, of a small collection of manuscripts. I presume that some assistance was wanted in the department, and Mr. Forshall made application to me.

3969. That was a catalogue belonging to Mr. Cochran?—It was.

3970. What was the date of that catalogue?—The catalogue was made in the year 1829.

3971. To what extent?—I think about 500 manuscripts were described.

3972. Did that occupy a long period of time?—I think six months, but I cannot at this distance of time state precisely.

3673. Is your situation understood to be permanent?—Nothing is expressed in terms as to its permanency. I consider it permanent. I am subject of course to dismissal by the Trustees, either from the work on which I am employed ceasing, which, however, is not likely to be the case, or from misconduct.

3974. Will you state what is the nature of the appointment?—I have no appointment in writing. I presume that I am in the Museum under a minute of the Trustees, who have the entire management of the institution; but I do not know the terms of any such minute.

3975. You have had no intercourse or communication with the Trustees?—No, never.

3976. Then the only communication that you have had in reference to the appointment is with Mr. Forshall the secretary?—Exactly so.

3977. What was the nature of the communication?—The first communication made to me of my appointment, was by note from Mr. Forshall, requesting me to come on a certain day to commence my engagement; I think those were the terms of the note, but I have not the note remaining. The only other communication that I have had with Mr. Forshall respecting my situation, was about 18 months since, when he was kind enough to express great approbation of my services in the Museum, and to say that he should apply to the Trustees for an augmentation of my stipend, which was, in fact, granted soon afterwards.

3978. Then as far as you know from any official communication, you are appointed wholly and solely by Mr. Forshall?—I have nothing in writing to show to the contrary; but knowing, as every one in the Museum does, that the Trustees are the masters of the institution, I consider myself of course under them.

3979. But you have no official communication appointing you to any situation

tion in the Museum under the authority of the Trustees?—I have no official communication.

3980. Is that the case with others of your rank and of your standing?—I cannot positively say, but I believe that all are in the same situation.

3981. Is that satisfactory to the gentlemen in the Museum?—We should like it otherwise; I should for my own part, but as Mr. Forshall has always behaved in a very friendly manner to me, I never felt it a cause of dissatisfaction, at least to such a degree as to cause me to express it by formal complaint.

3982. Have there been any representations made by the officers of the Museum, or any representations made by the secretary, as to the absence of official appointments among the gentlemen of the Museum?—I do not think that there has been any communication between myself and Mr. Forshall upon the subject.

3983. You are not aware whether that has been a subject of discussion among the Trustees, or whether any minutes have passed upon the subject?—I have no knowledge whatever of anything which may have passed between the Trustees and Mr. Forshall with respect to my appointment or that of the other assistants.

3984. Will you state the salary you derive from the Museum?—Fifteen shillings for every day on which I am actually employed at the Museum. When I was first appointed I was paid at the rate of 12*s.*; at the end of five years Mr. Forshall in a very kind manner proposed to use his influence with the Trustees to obtain an augmentation of my stipend; in this he succeeded, and I have in consequence from that time to the present received at the rate of 15*s.* for each day. This application was made by Mr. Forshall unasked by me, and therefore I feel indebted to his kindness for it.

3985. In the questions that will be put to you, there is no sort of intention of questioning your meritorious service in the Museum, and therefore you are asked whether that mode of payment with that augmentation of 3*s.* a day is one satisfactory to your feelings as a gentleman, and at all commensurate with the labours entailed upon you by the Museum?—With regard to its being commensurate with my labours in the Museum, it is not for me to judge; with reference to the mode of payment it certainly is not satisfactory (I speak for other assistants as well as for myself); we should all like it changed, and we certainly hope for such a change from the good feeling of the Trustees. The whole of the assistants now in the Manuscript department are of comparatively recent appointment; I am myself the senior. I consider that the department is, if I may use the term, in a transition state.

3986. A transition state common to all the affairs of the Museum?—I am speaking only as to the situation of the assistants in the Manuscript department.

3987. When and by whom are you paid?—We are paid monthly; we are called upon every month, two or three days before the day of payment, by the messenger, to give a statement of the number of days upon which we have been employed, or rather, of the amount due, which implies the number of days; two or three days afterwards the money is brought to us by him; I have occasionally received it from Sir Henry Ellis in person.

3988. That is to say, a messenger of the Museum is employed to pay the weekly wages of the gentlemen employed upon literary duties in the Museum?—It is so in fact; but I do not think that it is done with any intention to mark a difference; because the messenger, I believe, sometimes carries to the officers the cheques for their salaries.

3989. The question did not relate to the intention, but simply to ascertain the fact?—The fact is as I have now stated.

3990. Are deductions made when you are absent, on account, for instance, of illness?—The absence of every day, from whatever cause, whether voluntary or imposed upon us by the regulations of the Museum, is deducted.

3991. Whether you are absent from illness or not, still this weekly pittance is reduced?—Certainly, by the number of days on which we have been absent.

3992. Can you assign any good reason for such a mode of payment of literary men?—Certainly no good reason.

3993. Do you think it calculated to raise the character, and to call out the exertions

Mr. *John Holmes.*

19 May 1836.

exertions of gentlemen employed upon literary labours of importance?—I do not. I know of evil consequences resulting from it, and it is not, as I believe, satisfactory, as I have said before, to the feelings of any one so receiving it; but as we all in the Manuscript department like very much the situations which we hold, we have never made any formal representation upon it. I do not think that it is the wish either of Sir Henry Ellis or of Mr. Forshall that it should be continued. Mr. Forshall, on the contrary, has expressed to me his hope of seeing the system altered.

3994. You are not aware that an economical reason has been assigned for this mode of payment, in the evidence of last year?—I do not at this moment remember it.

3995. You have stated that Sir Henry Ellis is adverse to this mode of payment?—I cannot say positively; but I think he has sometimes so expressed himself to me; but I will not say that positively, as what may have passed between us was in the course of friendly conversation, and I do not feel authorized to affirm it as his opinion.

3996. The advantage of this mode of payment is stated by Sir Henry Ellis to consist in relieving the institution from the incumbrance of the employment, when the necessity for it ceases. Can you reconcile that with your impression that he is adverse to it?—I cannot reconcile it; but I have said that it is my impression only, and I would not have that put in opposition to his written testimony.

3997. But your opinion is that Mr. Forshall is adverse to it?—That is decidedly my opinion; he has said to me that he wished to see the present system of pay altered. He has never said that he considered it decidedly objectionable, and I repeat that we (the assistants), have never made any formal complaint about it.

3998. You said that the gentlemen employed in your situation are all very well satisfied with their situations and prospects?—We all very much like the Museum.

3999. Do you like the Museum, taking all circumstances together, including the subject of the preceding examination?—There are some circumstances certainly, which I should wish altered.

4000. Has not the Museum lost occasionally some valuable services from the under-rate of payment?—It lost the very valuable services of Mr. Stevenson, who I know would not have left the Museum, but that he was offered, under the Record Commission, the situation of a sub-commissioner, at a higher salary; he would have preferred remaining in the Museum.

4001. Do you know the amount of that tempting remuneration?—£. 300 a year was the sum offered; but he received only 250 *l.*

4002. You have spoken of the transition state of your department; what is the precise meaning to be attached to that?—I think that, from whatever cause, there were great arrears in the department, great accessions were also made, assistance was wanted for the officers, and it was not perhaps considered advisable at that time to enlarge the staff of the department. Temporary assistance was sought, subject, as I presume, to future arrangements of a permanent nature. That is the explanation I would offer of the term transition state.

4003. You do not mean by that, that you were likely to be promoted from one situation to another, in consequence of laborious services?—No; I conceive that at a future time the establishment of the Museum must and will be enlarged.

4004. Is the principle of promotion acknowledged in the appointments in the Museum?—I cannot say that; since I have been in the Museum there have been but one or two vacancies. The vacancy which was caused by the resignation of Mr. Walter, was filled up by the appointment of Mr. Panizzi.

4005. It is not so acknowledged as to influence the conduct and labour of individuals?—I certainly hope to be permanently *appointed* to the Museum, and I also hope that it will be by an extension of the establishment rather than by any other means.

4006. You have spoken of arrears by accessions and otherwise; will you state what are the arrears other than those arising from recent accessions of manuscripts and collections?—The term recent is relative; there were a great many manuscripts of which there was no catalogue; some of these manuscripts had been

been acquired by the Museum shortly before I accepted the situation which I now hold.

4007. Have any catalogues been brought out in your time?—One catalogue, that of the Arundel collection; another is nearly ready.

4008. Who compiled that catalogue?—It was compiled by the department generally, under the revision of Mr. Forshall.

4009. Will you describe what you mean by being compiled by the department, under the revision of Mr. Forshall?—The rough draft of the catalogue is drawn out by the assistants, Mr. Forshall revises it and makes material alterations and improvements; in fact, his superintendence of it amounts in some cases to a recomposition of what has been written; he is the responsible person for it.

4010. Mr. *Marshall.*] Did the assistants compile the catalogue in separate portions individually, or did they do it together?—Each individual takes a manuscript separately and writes a description of it, which is submitted to Mr. Forshall.

4011. Mr. *Hawes.*] Will you state what catalogues have been completed and brought out since you have been there?—The Arundel catalogue is the only one that has been brought out.

4012. How long have you been there?—Between six and seven years.

4013. You have spoken of the Arundel catalogue as having been revised by Mr. Forshall; had Sir Frederick Madden any share in it?—None whatever.

4014. Does he take an active part in the preparing the catalogues in your department?—Sir Frederick Madden sits in a separate room. I do not know what his portion of work is; the assistants act solely under the directions of Mr. Forshall.

4015. Sir *Robert Inglis.*] When was the Arundel collection brought to the Museum?—I think in 1831.

4016. When did you enter the Museum?—In the beginning of the year 1830.

4017. Then the whole of that collection has been brought to the Museum since your engagement?—It has so.

4018. And the catalogue formed since that time?—Yes.

4019. The catalogue was printed in 1834?—I believe in 1834.

4020. Mr. *Hawes.*] Then you do not consult Sir Frederick Madden at all in those matters?—No; Mr. Forshall alone exercises any authority over the assistants in the department.

4021. With reference to the custody, has the assistant-keeper the custody, in a technical sense, of the manuscripts?—Yes.

4022. Equally so with the keeper?—I believe so.

4023. Have the attendants the custody and care of the manuscripts, not in the technical sense?—They have the directly mechanical part of the duties to perform.

4024. They have keys to the cases, have they not?—They have keys to all the cases.

4025. Do they not take out the manuscripts at the request of the readers, and return them to the place of deposit?—Yes, that duty is performed by the attendants alone.

4026. Is there any superintendence exercised over the state of the manuscripts when replaced?—Certainly not a daily superintendence over each individual manuscript, either when taken to the reading-room or when returned.

4027. Might not portions be abstracted without the knowledge of the keepers upon the existing system in the Museum?—Such might certainly be the case, but I am not aware that anything of the kind has actually occurred.

4028. Is there anything like a direct vigilant superintendence exercised by the keeper or by the assistant-keeper over the manuscripts which either are in use or which have been used by the readers, either at the time of their being used or at a subsequent time, so as to insure their safety and security?—Not daily or hourly, because in that case the keepers would take the places of the attendants; but once a year, as I believe, an investigation is made into the state of the department, and it is ascertained whether every manuscript is in its place, or can be accounted for.

4029. Sir *Robert Inglis.*] Is every manuscript, as it is taken out for the use

Mr. *John Holmes.*

19 May 1836.

of the reading-room entered, with the name of the party desiring the production of it?—A register is kept which includes the name of each person requiring any manuscript, with the date when he receives it, and, I believe, the day on which it is returned.

4030. And when such manuscript is brought back from the reading-room to the place of deposit, is any corresponding entry made in the register?—I believe there is.

4031. Mr. *Hawes.*] You have stated that every year the department is investigated, will you describe the nature of the investigation?—The inventory is inspected, in order to see whether it corresponds with the manuscripts on the shelves; in point of fact, the object of the investigation is to ascertain whether every manuscript is in its place, or, if not in its place, by whom it is in use.

4032. How long does that take?—I think three or four days, or more.

4033. And in that time do you mean to say that every year each volume of manuscripts is examined by the keeper or the assistant-keeper?—I do not say that every volume is examined or even taken from the shelves; but as all the volumes have a number upon the back, it is easy to see if any manuscript is missing.

4034. But you spoke of that investigation in answer to a question with reference to a possible insecurity; now is the investigation of a nature to insure security in that respect to which the question referred?—Not as regards the internal state of the manuscripts.

4035. Is that the fault of the system or not?—If it be a fault, it is the fault of the system; such is the system.

4036. Assuming it to be a fault of the system, and by no means considering it as a neglect of duty on the part of the officers, do not you think a better system might be devised, a better division of labour, and thereby a more accurate superintendence of the manuscripts?—I think a better system quite feasible.

4037. Has it ever been made a subject of representation on your part, or has it ever been made a matter of consideration between you and your superiors?—Certainly not. I consider that any representation made by me to Mr. Forshall on this subject would appear in the light of an interference with his duties.

4038. Are you not encouraged to make representations with respect to improvements that might be made in the department by your superior?—I do not think I can say encouraged to make such representations, and perhaps it would not be desirable that I should do so; but if I saw any flagrant abuse existing, if I saw, for instance, any manuscript ill used, I should report it directly.

4039. Sir *Robert Inglis.*] Will you explain the locality of the great collection of manuscripts, and the locality of the reading-room, in order to enable the Committee to see what is the extent of the custody committed to the attendants in removing a manuscript which may be required from its deposit to the reading-room and back again?—The reading-room is the adjoining room to that in which the manuscripts are kept. A manuscript, after it has been used in the reading-room, is returned to the attendants, who generally put it upon one of the tables in the manuscript-room. After the reading-room is closed the attendants return the manuscripts to their places.

4040. Do the several officers of the Museum, not taking the word in its strict and technical sense, but gentlemen engaged in the Manuscript department, sit in the room in which the manuscripts are placed?—The assistants, including myself, all sit in that room.

4041. How many gentlemen sit in the room in which the manuscripts are kept?—Five.

4042. When the manuscripts are in the reading-room, are they practically as well as technically in the custody of the keeper of the manuscripts?—I cannot speak upon that point; I very seldom go into the reading-room.

4043. Is there any functionary of the Museum who is in charge of the reading-room?—The chief attendant.

4044. Mr. *Hawes.*] A person of the rank of attendant; that is to say, a person below the gentlemen who are employed as assistants?—I wish to speak of the chief attendant, Mr. Cates, with every respect; but if you mean an educated

cated gentleman, he is not such; he is, however, most highly respected by every one in the Museum.

4045. Sir *Robert Inglis.*] Is not it his duty to point out any mischief which is done to the works, whether printed or manuscript, which may be required for the use of the reading-room?—I believe it is.

4046. Have you reason to believe that any injury is wilfully or needlessly done to any manuscript which has been transferred from the depository to the reading-room, since you have been in the Museum?—I never have heard of any instance.

4047. Mr. *Hawes.*] Have you any reason to believe, from personal knowledge, that any injury has been done?—It would be difficult to prove that any injury has taken place.

4048. Sir *Robert Inglis.*] You know nothing, and suspect nothing, and have heard nothing, which leads to the belief that injury has been done?—I do not think that any injury has been done wilfully; some of the manuscripts are very much used, and in consequence their condition is not good; the binding also is injured.

4049. The question put to you was as to wilful and needless injury; not the inevitable wear and tear of manuscripts in frequent use. As to wilful and needless injury, do you wish the Committee to understand that, so far as you know, any has taken place?—I do not know of an instance.

4050. You were asked whether you were encouraged to make any representations upon the state of the Museum; have you ever been discouraged when you have made such representations?—Certainly not; but I have never felt it my duty to originate any such representations.

4051. Have you reason to think that any such discouragement would be offered to any suggestions which you might make upon the subject?—I think that any suggestion which I might make would act so materially upon my own situation as to make it appear that I had a personal interest to serve; a thing which would always deter me.

4052. Mr. *Hawes.*] That is to say, the system of management is not one in fact to encourage all the faculties, and to bring out all the zeal of the officers employed?—I conceive that no one can be fit for a situation in the Museum unless he has a love for the work, and wishes to do more than mere duty would oblige him to perform.

4053. That is to say, a love for the peculiar employment itself, sufficiently great to prevent his being sensible to the want of pay, and the mode of treatment?—The want of pay is one thing; the mode of treatment, as far as the officers are concerned, I must say, speaking for myself, has always been very kind and friendly.

4054. By the mode of treatment is meant, the mode in which you are paid by the Trustees, and the deductions to which you are subject by the Trustees, as explained in previous questions?—I certainly do not approve of the mode of treatment in that respect; but I did not feel it such a grievance as to make it formally known.

4055. But your attachment to the employment overcame your sense of the mode of payment?—Certainly; I think it would overcome even greater grievances.

4056. Sir *Robert Inglis.*] Will you be so good as to read article 12 of chapter 3 of the Statutes of the Museum, in which it is stated as follows: "The principal attendant shall keep a book, in which shall be entered the names of all those who have duly obtained admission into the reading-room; and it shall be his duty to take care that no person enter the room without being authorized; to see that the readers are provided with such books or manuscripts as they may require, and to assist them so far as may be in his power in the objects of their research; he shall also see that they do not damage the books or manuscripts nor annoy any of the other readers." Have you reason to think that the duty inculcated in that article is regularly observed?—I never heard a doubt of the correct performance of Mr. Cates' duty; he is considered a most meritorious person.

4057. Is there another security, in addition to the presence of the principal attendant, derived from the number of readers in the occupation of the room, and in their relative position to each other; in other words, is there any one position in the reading-room in which a person can be so screened from observation

Mr. *John Holmes.*

19 May 1836.

servation as that what he may do to a manuscript could pass unreprehended? —I should hope not; I never heard of such a case; and I think that every one frequenting the Museum reading-room being of an educated class and of the class of gentlemen, his right feeling would lead him to notice any misconduct on the part of another.

4058. Mr. *Hawes.*] Did you ever hear of forgeries being committed upon the manuscripts in the Museum?—I have heard, in private conversation with Sir Harris Nicolas, that there are certain manuscripts which, in his opinion, have been tampered with. I believe that Sir Harris has already mentioned this to the Committee.

4059. Mr. *Marshall.*] Are you much in the reading-room?—I very seldom go into it.

4060. Mr. *Hawes.*] You have stated that you have no doubt the principal attendant in the reading-room discharges his duty, and the questions that will be put to you will have no personal bearing upon him, but will have reference to the possibility and discharge of the duty under the existing system. Can the principal attendant by himself see that no damage is done to the books or manuscripts in all cases?—One attendant certainly cannot overlook upwards of 200 readers, who are generally in the rooms; there is another attendant who sits in the inner reading-room, and there are two more, who are constantly passing backwards and forwards with books for the readers.

4061. Are not manuscripts obtained in the same way as the printed books, by tickets?—In all cases by tickets.

4062. And it is supposed that they are all registered on delivery and on return?—It is.

4063. Who keeps this register?—One or two of the attendants in the manuscript-room.

4064. Will you describe the attendants by name?—One is named Bromley and the other Marshall.

4065. Do they alone superintend the delivery and return of the manuscripts? —They alone.

4066. Are they quite competent to that duty in your opinion?—They are both very respectable men; I have no fear that they would do any wilful damage to a manuscript nor have I any suspicion that they neglect their duty.

4067. But it is placing considerable trust and confidence in them?—So far as the actual giving out the manuscripts and putting them into their cases again.

4068. Is that register ever overlooked by the keeper or by the assistant-keeper?—I am to presume that it is; I cannot speak from personal knowledge.

4069. Have you ever been called upon to look over it?—Certainly not.

4070. Do the keeper or assistant-keeper ever control the delivery or return of manuscripts themselves?—Of the select manuscripts only.

4071. Is there any formal inspection of the register?—That rests entirely with the two keepers of the manuscripts; what inspection they may ever make of it I do not know.

4072. You know nothing upon that subject?—Nothing.

4073. Sir *Robert Inglis.*] Is the access to the room in which the manuscripts are kept through the reading-room?—It is.

4074. Then you necessarily pass through the reading-room in your way to the manuscript-room?—I pass by one small corner of it; I very seldom go into the reading-room; I must necessarily pass from one door, which is in the corner of the reading-room, and at right angles with the door by which I enter the manuscript-room, but I very seldom go down or into the reading-room.

4075. Mr. *Hawes.*] That passage through the reading-room can give you no sort of supervision over the readers of books or the readers of manuscripts?— None whatever.

4076. The charters and rolls are about 20,000 in number?—They may be put at about 20,000; they are erroneously stated in one of the printed prefaces to the Catalogue or Synopsis, some time ago, at 40,000, but they are in fact about 20,000 in number.

4077. Are not they almost entirely under the control of the attendants?— When I want a charter I usually apply to one attendant in particular, or send another attendant to him.

4078. What is his name?—Scott; I do not know whether the other attendants

ants have keys to the drawers in which the charters are kept. I believe they have not.

4079. What kind of a person is Scott?—He is one of the attendants; and all the attendants are very respectable men; most of them are chosen for their previous good character.

4080. Do you know from what situations in life they have been previously chosen?—No.

4081. Did you ever hear anything upon that point?—I have heard of the previous situations of one or two; one in particular I was the means of introducing to the Museum; he had been a clerk in a public office.

4082. Is that generally the class or the position in life from which they are selected?—I believe the attendants are selected by the Trustees.

4083. Have you heard that some of them have been menial servants?—I have heard that some have been such.

4084. You do not happen to know whose servants they were?—I do not.

4085. Mr. *Marshall.*] Do you know what kind of servants they had been?—One, if not two, had been footmen.

4086. Sir *Robert Inglis.*] Whatever their previous position in life may have been, have they, since they have come under your observation, discharged faithfully and zealously the duties confided to them, so far as your observation extends?—So far as my observation extends.

4087. Have you reason to suspect the contrary?—No; I believe they are a very respectable class of men.

4088. Mr. *Hawes.*] In all cases?—Amongst such a number there may be exceptions; but I think that those who have the direct control of them could speak to that point better than myself.

4089. Sir *Robert Inglis.*] The question referred rather to those in respect of whom the previous questions have been addressed to you, namely, those who had access to the charters and rolls, and specially to the case of the individual named Scott, whom you have mentioned; has he, and have the others, under similar circumstances, discharged the duties confided to him and them respectively faithfully, so far as you have observed?—So far as I have observed.

4090. Have you reason to suspect anything to the contrary?—No.

4091. You have referred to the charters as accessible to one, at least, of those attendants; do you know how far they are examined at any time by the keeper of the Manuscript department himself?—I do not.

4092. You do not know whether he makes any periodical inspection or visitation?—I do not; they are not in the room in which I sit, and I have not witnessed any examination.

4093. Mr. *Hawes.*] What was the name of the attendant that you spoke of as having been a clerk in a public office?—Mackenzie.

4094. Does he zealously, and to your satisfaction, discharge his duties in the Museum?—I believe that of late he has been under the displeasure of the Trustees; Mr. Forshall, his immediate superior, having reported him to them.

4095. Do you think it desirable that so much should be entrusted to the attendants, considering the class from which they have hitherto been selected?—I think it is not desirable.

4096. More especially considering the great value and extreme rarity of some of the manuscripts?—That is certainly my meaning.

4097. There are some select manuscripts; is the classification of those good. Are the most valuable and the most rare exclusively called the "select" manuscripts, or is it somewhat arbitrary and capricious?—That is greatly a matter of opinion; there are some manuscripts not considered "select," which, in my opinion, are of a higher value than some which are now so considered.

4098. Speaking of the most valuable, they are all allowed to go in the reading-room?—The Alexandrian manuscript, I think, is not, as well as some few others.

4099. Why has that been forbidden?—On account of its great value, and the great loss that would be sustained should any injury be done to it.

4100. Has that restriction been placed upon it in consequence of any damage to which it has been subjected by occasional exhibition to the curious?—I believe that, under the former constitution of the Museum, it was one of the manuscripts generally exhibited to visitors. I am speaking of a period 30 or 40 years ago, and of what I have heard only.

Mr. *John Holmes.*

19 May 1836.

4101. That is a manuscript of extreme value and rarity?—It is one of the most valuable, perhaps the most valuable, in the world.

4102. Is that manuscript, in common with the others, under the entire custody and control of the attendant?—The select manuscripts are in the room of Sir Frederick Madden, the assistant-keeper.

4103. But still in some degree under the entire control of the attendant?—When a select manuscript is wanted by a reader, if it is one which is usually allowed to be taken into the reading-room, the attendant goes for it into Sir Frederick Madden's room, and I am to suppose that Sir Frederick either takes the MS. from the case, or gives the attendant the key to get it.

4104. Sir *Robert Inglis.*] Do you know whether the Alexandrian manuscript could or could not be taken, by one of the attendants, from its depository, and removed to the reading-room or to any other room whatever?—Not except in defiance of the strict orders which have been given to the contrary.

4105. Has he the means of removing the Alexandrian manuscript?—I believe he has.

4106. Do you from your own knowledge state that the Alexandrian manuscript is in such a position that the attendant, without the presence of Mr. Forshall or Sir Frederick Madden, could take it?—He certainly could at times.

4107. Mr. *Hawes.*] Is not the custody and safety of this invaluable manuscript entirely dependent upon the honesty of the attendant?—The attendant certainly has it in his power to do it great injury.

4108. But he would also have it in his power to steal it, would not he, for anything the keeper or the assistant-keeper might do to the contrary to prevent him?—There are times certainly when he might. I wish to qualify this answer. On Saturdays neither of the keepers is bound to attend; Mr. Forshall, however, is generally in attendance, but he is not in the room in which the select manuscripts are kept. All the select manuscripts are inclosed in one and the same case, and as the attendant must necessarily go to that case when any select manuscript is wanted for the readers, he would, of course, either secrete one of the volumes, or part of one of the volumes, or he might damage them.

4109. Sir *Robert Inglis.*] Is it within your knowledge that the attendant has or has not the key to the case in which the Alexandrian manuscript is placed?—He has not the key in his own custody, but it is kept in Sir Frederick Madden's room, in a drawer, to which the attendant has most often, I do not say always, access.

4110. Can he have access to that key without the sanction of Sir Frederick Madden?—I have reason to believe so.

4111. Mr. *Hawes.*] Are not the keys in his possession for an hour before Sir Frederick Madden arrives, that is at nine o'clock in the morning?—I do not know, but I believe so.

4112. Are not the keys in his possession an hour after Sir Frederick Madden goes?—The keys of the department generally; I am to suppose that Sir Frederick Madden locks up the key of the case in which the select manuscripts are kept.

4113. Sir *Robert Inglis.*] In other words, is the key of the cases of the select manuscripts, including the Alexandrian manuscript, accessible or not to the hand of the attendant?—It is so accessible at times.

4114. At the time when Sir Frederick Madden is not in the room?—It is on Saturdays, certainly, because I have often on those days, as well as at other times, desired select MSS. to be brought to me by the attendants, who could not have done so unless the key had been accessible to them in Sir Frederick's absence.

4115. Mr. *Hawes.*] Any one who has admission to the reading-room, of course can demand the sight and use of those manuscripts?—I presume so; I do not know whether any discretionary power of refusal is given to the keeper of the manuscripts. Any one wishing to see the Alexandrian manuscript is introduced for that purpose into the manuscript-room.

4116. You have spoken of the attendance of the keeper and the assistant-keeper on Saturdays. Is Sir Frederick Madden in attendance constantly on Saturdays or not?—Very rarely; by the terms of his engagement he is not bound to attend on Saturday.

4117. Therefore the care and custody of the manuscripts more particularly falls

falls on Mr. Forshall on Saturday?—Mr. Forshall also need not attend on Saturday; but he is almost always in the department.

4118. Readers are requested to point out any defects in the books or manuscripts to the attendant in waiting?—I know that only from the printed instructions for the reading-room, in which it is so expressed.

4119. If they wish to make any communication to an officer in the reading-room, to whom would they address themselves?—I suppose to Mr. Cates, the chief attendant.

4120. Not to any of the principal officers?—Many of the readers are personally known to the officers, and if they have any remark to make or wish to obtain any information, they come into the manuscript room; but no officer is in the reading-room. In this way I myself have very frequently been applied to by readers.

4121. Have the readers of manuscripts complained at all of the want of accommodation; for instance, the absence of a room to collate in?—Yes; I have heard several complain of that want.

4122. Has that ever been represented to the superior of your department?—I do not know.

4123. Collation could not conveniently be carried on in the reading-room?—No; it is by Mr. Forshall's permission sometimes carried on in the manuscript room, and it is rather an annoyance to those engaged there; but if it is allowed at all, it must at present be done there.

4124. Therefore the arrangements and regulations of the Museum, so far as the Trustees are concerned, are defective in that respect?—I do not know whether or not this will be remedied in the new building.

4125. Have you ever seen the plans of the new building?—I have seen one or two of the plans in a very cursory manner, and I have seen the model.

4126. Has it been matter of discussion amongst you and your superiors, as to the accommodation that may be required, or conveniences that may be suggested?—Never.

4127. Is there any room provided for the washing of hands, or anything of that sort, for the public?—No.

4128. Or for the officers?—Those of the officers who have private rooms, have in them places fitted up for that purpose.

4129. But those that have not rooms; for example, the gentlemen in your situation?—There is a room in the Under-ground department, or rather vaults, below Mr. Forshall's room.

4130. That is a sort of public place of resort, is it not?—The attendants also have access to it; they wash their hands at a separate table.

4131. For the accommodation of the public, is there anything like water-closets?—There is not. I can have no hesitation in saying that I think the Museum buildings are extremely defective in all points regarding minor accommodations and the personal convenience of those employed in it. For the public there is no accommodation whatever, I believe, of the kind alluded to in the question.

4132. Are there those conveniences for the assistants?—They have those to which the readers and attendants also go.

4133. Have any remedies suggested themselves to your mind in reference to your own particular department, for the evils which have been elicited in your examination?—The have sometimes been the subject of conversation amongst the assistants in the Manuscript department; several of the assistants have perceived the evils to which you allude.

4134. Will you suggest any remedies that occur to you?—I feel rather a delicacy in stating these things, because they bear so much upon the personal situation of myself and the other assistants. As the Committee, however, wish me to state my opinion, it is, that the assistants should have keys of the department, and that no attendant should be allowed to have a key of the cases on any account whatever; that the assistants should be responsible to the keeper, and should superintend the delivery and return of all manuscripts; that they should keep a register, to be signed every day, and make a report in writing to the keeper upon every manuscript whose state may require notice or remark, whether upon its general condition, loose leaves, or defective binding; that the assistant or officer on duty should not leave the department until every manuscript given out for use during the day is returned and replaced, and that there

Mr. *John Holmes.*

19 May 1836.

there should be no exception to such return, unless by order in writing from Mr. Forshall.

4135. Sir *Robert Inglis.*] Does not that imply the transference of a purely mechanical office from the attendants to the assistants, taking both words now in their official sense, in the British Museum?—No; I think that if each of the assistants took this duty in turn, and had the services of an attendant allowed to him, who should be at his special orders for the time, that it is perfectly feasible and would be satisfactory. It would be in my opinion highly beneficial to the institution, and a greater security not only to the Trustees and to the public, but also by reason of the safer custody to the keeper of the manuscripts, who would be enabled by this plan to have a daily account, if necessary, of the state of the manuscripts. The responsibility would be direct and practical, instead of being technical or nominal only, as at present; and if any fault were observed, it could be visited directly upon some one person, which under the present system cannot be the case.

4136. Would you desire that each manuscript exhibited to a visitor or reader during the day should be collated by the assistant before it should be replaced on its shelf at the close of the day?—Certainly not to be collated leaf by leaf; it would be impossible to do so; but I think that the general state of a manuscript may be well observed without subjecting it to that process.

4137. Mr. *Hawes.*] Would it not be desirable also that the assistants, particularly gentlemen in your situation, should be recognised as junior officers, and put upon a permanent footing?—Our wishes of course lead us to desire that.

4138. Putting aside for the moment wishes that you might personally entertain, and speaking only as a literary man in reference to the effect of such an alteration of the regulations of the Museum upon literary men, do not you think it desirable?—I do. I have stated that I think the Museum has suffered a great loss by the situation of the assistants; I have stated that Mr. Stevenson left it on that account; I may also state that an application was made to a gentleman, requesting him to become an assistant in the Manuscript department, a gentleman highly distinguished for his knowledge of Saxon and northern literature, and who would have been a great acquisition to the Museum, Mr. Kemble; he refused for the same reason to accept the offer.

4139. Would not one great advantage that would follow from the regulation you propose to introduce with regard to the account to be kept of the manuscripts used and the return to be made to the chief keeper be this, the intimate acquaintance which all parties, keepers and assistants, would necessarily obtain with the manuscripts under their charge?—Of course in proportion to the frequency with which the manuscripts came under the cognizance of any officer of the department his acquaintance with them would be increased, and it would be a great advantage to him in every way; it would also enable him to afford very great assistance to the readers, with whom he would more frequently come in contact; I may also add, that in the exhibition of curious MSS. to foreigners and to other casual visitors, the MSS. would be exhibited by gentlemen competent to describe them properly, instead of by attendants, who cannot be expected to know much of the MSS. nor to give the visitors a very high idea of the Museum functionaries.

4140. As a substitution for the exhibition of the more valuable manuscripts and papers, which are sometimes shown to casual visitors, could not a selected exhibition under cases be furnished, which would prevent injury to the manuscripts from such exhibition?—I believe that some such measure is in contemplation; Mr. Forshall has lately mentioned it to me in conversation.

4141. Sir *Philip Egerton.*] Do not manuscripts suffer from the effect of light?—There are many that do not suffer from the effect of light, some perhaps would; those which are illuminated with colours, particularly with green, might suffer.

4142. Mr. *Marshall.*] Have you heard also that the reason why that has not been sooner done is the want of space?—I have heard so.

4143. Mr. *Hawes.*] If such an exhibition was determined upon, it should be in some degree a systematic exhibition, a classed exhibition, should it not?—It certainly should be so. I conceive that any one exhibiting manuscripts would naturally class them so as to show the progress of writing and of art. There would be specimens of early writing in various languages and in order of time; illuminations of the various ages and different schools of art, such as the Greek, Italian,

Mr. *John Holmes.*

19 May 1836.

Italian, Flemish, and early English; autographs of royal and eminent persons; Oriental manuscripts, showing their different characters and modes of ornament.

4144. Would it not be desirable that something like a journal should be kept, to show the exact date of every acquisition to the department, and whether purchased or presented, and such particulars as would at once give an inventory, with remarks and observations upon every thing that was presented?—I think that such a journal would be desirable for every department of the Museum.

4145. Is there such a journal kept of the daily acquisitions of purchases or presents?—Nothing further than the accounts of the Museum will show.

4146. Do not you think that that department admits beneficially of some subdivision?—I think not at present, and I also think that at present such a division would be unfair to Mr. Forshall. I think he is eminently qualified for his situation, being at once an Oriental scholar, and possessed of great general knowledge. These are acquirements which are rarely found in the same person.

4147. Assuming the department to be recognized, without reference to Mr. Forshall, whose fitness for that office is not at all disputed, would it not be desirable to have some better subdivision than exists?—If the Museum were extended or more subdivided, I think that the Oriental manuscripts might be separated from the general class of manuscripts, because those who are Oriental scholars are very seldom attached to other pursuits.

4148. Then one great division might beneficially take place, into the Oriental and the General?—At a future time, if any division is to take place, I think such a division as is mentioned would be the most natural.

The Rev. *Josiah Forshall*, called in; and Examined.

Rev. *J. Forshall.*

4149. Mr. *Hawes.*] YOU have heard the examination of Mr. Holmes; have you any general observations or explanations which you wish to make, in reference to that examination?—I think not.

4150. In reference to the proposed exhibition of the manuscripts, will you state what intention exists, and the mode in which you intend to carry it into execution?—It has been my intention for some years past, whenever we had space for the purpose, to propose to the Trustees the exhibition, in table cases under glass, of some of the more splendid of our manuscripts, such as are generally now shown to casual and curious visitors, in order to preserve those manuscripts from the injury to which they are liable, from being frequently handled. Some months ago I mentioned the subject in one of my reports, and directions were immediately given for the table cases; these are now in hand. Specimens of our manuscripts would have been generally shown long ago, if the Museum had afforded any convenient or sufficient space for such an exhibition.

4151. Can you give a detail now, of the existing catalogues of manuscripts in the Museum?—Yes.

4152. To begin with the old Royal Library manuscripts?—That collection contains about 1,884 manuscripts, and a catalogue of it was printed by David Casley in 1734, some years before the collection came to the Museum.

4153. Is that an accurate and good catalogue, in your opinion?—It is not; it may be considered tolerably correct as far as it goes, but by no means sufficiently ample.

4154. Has any alteration or improvement been made in it since the Museum acquired it?—None, except that a few notes have been added by Sir Henry Ellis, in an interleaved copy of it.

4155. Is the arrangement of the manuscripts in the catalogue a convenient one?—Yes; it is the same which is observed in all the other catalogues, except that of the Sloane collection. The manuscripts are taken as they originally stood upon the shelves, or sometimes in the order of their acquisition, without any classification whatever. It would be very difficult, and of no adequate advantage in forming a catalogue of a miscellaneous collection of manuscripts, to arrange them systematically.

4156. The arrangement is not strictly alphabetical in the index, is it?—In the index it is.

4157. Is the index to the catalogue under one alphabetical arrangement?—Yes.

Rev. *J. Forshall.*

19 May 1836.

4158. Then there is one general alphabetical index to this catalogue?—There is.

4159. Has not Sir Harris Nicolas published some index to assist the general readers?—He printed a half sheet, or it might be a sheet, containing an index to the designations of the manuscripts, or the technical marks by which they are known, so that the inquirer might refer more easily to the page of the catalogue where any particular manuscript is described.

4160. This was the work of a private individual, and it is found useful to general readers?—Yes; it is not a work of very great labour; it would not take many hours to accomplish it.

4161. Are there not some charters among those manuscripts?—There are.

4162. Is the catalogue, describing those charters, in the reading-room?—It is frequently there, and may be had by any reader who asks for it.

4163. With reference to the Cottonian collection, is that catalogue in a satisfactory state?—It might be improved; but as I stated to the Committee last year, it is as fair a catalogue as could reasonably be expected from the labour of a single individual, considering the period when it was published.

4164. Has it received any improvement since it has been at the Museum?—I have some notes and additions to the catalogue, but they are not very extensive.

4165. Does it contain any description of the charters?—No, it does not, except some few which are bound up in a volume, known by the designation of Augustus II. These are some of the most ancient and valuable charters in the collection.

4166. Is that catalogue in the reading-room?—It is.

4167. With reference to the catalogue, sometimes called Hooper's or Astle's catalogue, is that a good catalogue?—The catalogue you refer to is a privately-published catalogue.

4168. What is your opinion of it?—It is useful; but I never examined it sufficiently to give an opinion as to its accuracy.

4169. Is there any other catalogue of the Cottonian charters but that?—No printed catalogue of the whole of the charters.

4170. That is a catalogue which the Museum acquired?—It was not published by the Trustees.

4171. Has it been at all improved or amended by the Museum?—No; because we have another and more full manuscript catalogue of the Cottonian charters, which was drawn up by Mr. Ayscough. This catalogue has received many corrections and additions, as well from Sir Henry Ellis as from myself, and Sir Frederick Madden. The catalogue to which I now refer is a general catalogue of all the charters belonging to the Museum.

4172. Mr. Planta also composed a catalogue, did he not?—Of the Cottonian manuscripts.

4173. What is your opinion of that?—I have already stated that it is as fair a catalogue as can reasonably be expected from the labours of one man, considering the date when it was published.

4174. You consider it a fair catalogue for the time, but it is very erroneous and imperfect?—I should not call it very erroneous and imperfect; it is imperfect certainly; in some places there are errors, as there will be in all catalogues.

4175. Was it an original work of Mr. Planta's, or was it founded upon the labours of any other person?—There was a printed catalogue of the Cottonian collection before, which he made the basis of his own; but still the greater part of the matter in the catalogue now under consideration was supplied by Mr. Planta himself.

4176. Does it contain any account of any of the burnt manuscripts?—It does, of those which are in the best state, and at the time the catalogue was made were capable of being used, but not of the burnt fragments, which have been opened and washed since I came to the Museum.

4177. There is no notice taken in this catalogue of some of the Saxon manuscripts which were burnt or injured?—There are several fragments of Saxon manuscripts not noticed there.

4178. A part of some of the destroyed manuscripts were printed before the fire, were they not?—A catalogue of all those manuscripts was printed before the fire.

4179. Were not part of the destroyed manuscripts printed?—I am not sure that I understand the question. Several of the works and papers contained in the burnt MSS. had appeared in print before the fire, and the Cotton MSS. had been extensively consulted, and many of them carefully examined. The Cottonian Genesis, for instance, one of the most curious and valuable MSS. of its kind in the world, had been collated, and its various readings published.

4180. Are they noticed in the catalogue as printed?—No, not generally.

4181. Is it not important that notice should be taken of those manuscripts which have been printed?—Certainly. In the catalogues which have been prepared under my direction, such notice is introduced into the catalogue.

4182. There being a regulation for defects or imperfections in manuscripts to be put down by readers when they observe them, does that often occur?—No.

4183. To whom is the representation made when it does occur?—It would be made to me.

4184. To you directly?—Either directly or indirectly, as it happened to suit the convenience of the person making it.

4185. What would be the course adopted upon the representation being made?—It would depend upon the nature of the defect, and the nature of the representation.

4186. Supposing any defect to be pointed out, do you bring it under the notice of the Trustees?—I should think it my duty to represent to the Trustees any injury to a MS. whether it were done wilfully or accidentally; but I have never had occasion to do so, nor has any defect of the kind to which the question refers, been at any time pointed out to me.

4187. There are in this particular catalogue many well-known and acknowledged defects, are there not?—I am not aware that there are many well-known and acknowledged defects in the catalogue; we should probably find several on carefully revising it, and it might no doubt be improved.

4188. Are there not some defects that are generally known?—It is difficult to say what is generally known; but there are no important defects in it which have been brought under my notice.

4189. With regard to the Harleian catalogue, has it received any amendment or improvement?—No; very little indeed, since it was last printed.

4190. Is it not susceptible of great improvement and amendment?—Certainly; the latter part is susceptible of great improvement.

4191. Has any means been taken, either under your direction or proceeding from the Trustees, to improve it?—None whatever, beyond a few corrections which may have been occasionally made, as errors have been discovered.

4192. Will you state those improvements that you think might be made?—It requires amplification, and in many places correction.

4193. Does it want any absolute addition?—No; every manuscript belonging to the Harleian collection is described in it.

4194. The catalogue of the Sloane manuscripts was made by Mr. Ayscough?—It was.

4195. And that also was acquired by the Museum?—I do not recollect under what circumstances Mr. Ayscough's catalogue was printed; I believe it was a private undertaking.

4196. It was undertaken and completed before Mr. Ayscough was connected with the Museum?—I was not aware of the circumstance; very probably it was so.

4197. Has it been improved?—Yes; I have myself been employed for some time in making a new catalogue of the Sloane collection.

4198. Is it not in some degree a classed catalogue?—Yes.

4199. Do you continue to frame it upon the arrangement of Mr. Ayscough?—No; in the common way of other catalogues.

4200. You being of opinion that a classed catalogue is of secondary importance compared with an alphabetical catalogue?—In a catalogue of manuscripts, a full and well-constructed index of authors and subjects, with copious cross references, will give all the information which can be required. The index, so far as it details and arranges the subjects treated of, supplies the place of a classed catalogue.

4201. Your opinion is that a classed catalogue would be still a work of great utility, even of manuscripts?—I do not think that a classed catalogue, in the usual meaning of the term, would be of great utility; but a general index to all

Rev. *J. Forshall.*

19 May 1836.

our manuscripts is desirable; an index which would be much more full in its several parts than those which we have to our catalogue at present, and would combine the matter of all these indexes in one series.

4202. Will you give the Committee your opinion as to the importance of a classed catalogue of manuscripts?—I do not think, as I have already stated, that it would be important to have a classed catalogue of manuscripts, in the sense in which I use the term classed catalogue, namely, detailed descriptions of the several manuscripts, arranged in various classes and subdivisions, according to the matters treated of; but a good general index would be very desirable.

4203. Is there any commencement of such a work?—Yes; we are making provision for such an index.

4204. You contemplate forming a good general index of the manuscripts?—Yes.

4205. Within what period do you think, with your present staff, it will be completed?—It is difficult to say.

4206. Do you think there will be a chance of seeing it this century?—Yes, within 10 years or less, provided we have no extraordinary acquisitions. If the Museum should obtain such acquisitions, these must be catalogued by additional hands.

4207. Have you ever heard how long Mr. Ayscough was occupied in forming his catalogue?—I do not recollect; it is a very bad catalogue.

4208. Who compiled the catalogue of the Lansdowne collection?—The first part was compiled by Mr. Douce; the second part by Sir Henry Ellis.

4209. By whom was it printed?—By the Commissioners of Records.

4210. The Trustees had therefore nothing to do with that catalogue?—Not with the publication of it.

4211. Nor with the formation of it?—I conceive that they had with the formation of it; their own officers formed it.

4212. As officers of the Museum?—So I have always understood.

4213. Did they receive any remuneration from the Record Commission?—That is not within my knowledge.

4214. In your opinion it was formed by the direction of the Trustees solely?—I believe so; I have no reason to think otherwise.

4215. How did it happen that it was printed by the Record Commissioners?—I cannot tell.

4216. Who made the indexes?—I do not know.

4217. The Lansdowne catalogue is in two parts, is not it?—It is.

4218. And each has an index?—Each has an index.

4219. Has that been improved or amended at all by the officers in the Manuscript department?—Not that I am aware of; there may have been a few errors corrected, but they must be trifling.

4220. The manuscripts are numbered by Arabic numerals, and the articles are referred to by Roman?—That is the case; there is some advantage in it. The distinction was probably made to prevent the number of the manuscripts referred to being mistaken for the number of the article in the manuscript, and conversely.

4221. You confirm the statement given by Mr. Holmes as to the catalogue of the Arundel manuscripts?—Yes.

4222. Is the Burney catalogue completed yet?—It is not quite completed; there are 132 pages of it printed, and there are three or four sheets yet to print.

4223. There is also a catalogue of the Syriac manuscripts; is that progressing towards completion?—We are proceeding with it; there are 72 pages printed, and there may be sufficient matter to fill eight or ten more. The MS. is complete.

4224. Has any progress been made in the catalogues since last year?—Yes, but not so great progress as I could have wished; we have not, however, been standing still. The Syriac catalogue at this time last year had not advanced further than page 32; it has now reached page 72. Between 60 and 70 pages of the Burney catalogue were printed last year at this time; we have now printed 132; we have also printed a list of the additions made to the department in the year 1834, and a list of the additions in 1835 is nearly ready for the press. Very large accessions have been made to the department during the last year; in the space of about 14 months

347

Rev. *J. Forshall.*

19 May 1836.

months we have added little less than 1,000 volumes of manuscripts, all which have been arranged, bound or repaired, and numbered.

4225. Which will materially prolong the completion of the general index?—Yes, but not I think beyond the time I have already specified.

4226. Is not it very desirable that the work should proceed at a quicker rate?—Very desirable; it is very desirable to have complete and accurate catalogues, with a complete and accurate general index of all our manuscript collections.

4227. Do you think it a work of sufficient importance to require the immediate attention of the Trustees in reference to further assistance?—I should be very glad to have a larger sum applied to the formation of the MS. catalogues, and a larger sum applied to their publication, but I should at the same time wish a larger sum to be applied to the increase of our collections.

4228. Until there is a good catalogue of what you have, the collection is scarcely available, is it?—Yes, to a very great extent; manuscripts are frequently used in the reading-room within a few days after they have been acquired, and the public have the advantage of a printed list or brief catalogue of the manuscripts acquired each successive year, as soon as possible after its termination.

4229. Is there not a collection of manuscripts, called the Additional Manuscripts, of which there are no catalogues?—I think there are not more than 200 volumes of manuscripts out of 23,000, the number contained in the Museum collections at the commencement of the present year, of which we have not some catalogue.

4230. Two hundred volumes, containing how many manuscripts?—In the statements just made I have used the words volume and manuscript as identical; but in the Sloane collection and in some others, several MSS., bearing distinct numbers, are frequently bound together in one volume, and in some few cases the same number is attached to several volumes, so that Sir Hans Sloane's MSS., though numbered from 1 to 4,100, do not not probably fill more than 3,500 volumes.

4231. Each volume containing several manuscripts?—Not always, but frequeutly it is so.

4232. And the manuscripts on very different subjects?—Yes.

4233. Then 23,000 is to be considered as about the number of volumes of manuscripts in the Museum, but the actual number of the manuscripts you cannot state?—It is scarcely possible to state that; every distinct letter or paper may be considered a separate manuscript.

4234. If the index were complete, that of course would show not only the number of volumes but the number of manuscripts?—Neither; it would give a reference to every letter of any importance; not always to every letter separately; that would not be necessary.

4235. Each manuscript would be recorded in a distinct index?—Every book, tract, and document of any importance would be recorded distinctly; but in the instance of a correspondence between two individuals of no great note, and the correspondence itself of no great interest, it would be enough to index the whole of the letters by a single entry under each of the two names, specifying the extreme dates and the general subject.

4236. Mr. Holmes has corrected the number of the charters and rolls under the Harleian catalogue. Is that correction in your opinion a sound one?—Yes; in the Introduction to the Synopsis, down to the latest edition, printed about 1820, it is stated that the Harleian charters and rolls amount to 40,000 and upwards, whereas all the collections of this kind deposited in the Museum do not contain one half that number.

4237. What is the number of charters and rolls in the Harleian collection?—My impression is that there are about 16,000 in the Harleian collection; there are 19,000 and upwards of charters, rolls, and other instruments in the Museum.

4238. When you state that about 10 years will be sufficient to furnish the public with a good catalogue, does that comprehend the correction of the existing catalogues?—Yes, I wish to be so understood; the intended general index, when printed, will include the corrections of the present printed catalogues. I should not think it advisable to print a new catalogue of the Hargrave, or Lansdowne, or Cottonian manuscripts, nor indeed a new catalogue of the Harleian manuscripts, but to insert the necessary corrections or additions in manuscript, in interleaved copies of these catalogues, and to include the corrected or supplementary matter in the general index.

4239. There are no catalogues, except those which have been alluded to, existing,

Rev. *J. Forshall.*

19 May 1836.

of any of the manuscript collections at the present moment?—I think all have been mentioned in the evidence before the Committee.

4240. With reference to the buildings, and confining the question to your own department, have you been consulted at all by the architect in pointing out the necessary conveniences for the persons that frequent the reading-room and the Manuscript department?—With respect to the room in which the present manuscripts are deposited, the plan was settled before I was appointed to the Museum.

4241. With reference to the question generally, have you had any intercourse with the architect, with a view to improve the plans for that part of the building?—Very frequent intercourse with the architect, but not with this view, as before I became keeper of the department, the rooms assigned to it were entirely built and finished.

4242. In your opinion, are the plans such as will furnish the public all the convenience they have a right to expect from the new building?—That is a very comprehensive question; I hardly know what conveniences the public have a right to expect.

4243. Is the plan one which you are perfectly satisfied with?—I should not build the Museum as it is, if, with the advantage of my present experience, I were to construct it from the foundation.

4244. Have you made suggestions for alterations in the existing plan at any time?—I have.

4245. Have they been adopted?—I think generally; at least they have been very readily considered, and fairly discussed, both by the Trustees and by the architect.

4246. Will you state the principal suggestions you have made?—I am at a loss to give an instance, but I have frequently gone over parts of the plans, both with the Trustees and with the architect.

4247. Is the building, as far as your department is concerned, as convenient as is desirable?—In its present state not quite so; we require some additional small rooms; for instance, a collating room, a room to unpack and arrange new acquisitions, and a small room for the use of the gentlemen attached to the department. We shall have, however, the means of giving the public a place in which manuscripts may be conveniently collated, as soon as the readers are removed from the present reading-rooms to the north wing.

4248. With regard to the warming and ventilating, is it satisfactory at present?—The ventilation of the large manuscript-room is sufficient; as to the warming apparatus, we have tried several experiments in various parts of the Museum. I do not know that any complaints have been made to me of the want of sufficient warmth in the Manuscript department, except when it has arisen from accidental circumstances; but there appears to be great difficulty in warming satisfactorily large rooms, such as most of those in the new buildings of the Museum are.

4249. Is there any systematic ventilation adopted?—The windows are opened in the morning before 10 o'clock, the hour at which the ordinary business of the department commences, and in close weather they are opened also in the afternoon.

4250. But no system of ventilation is carried on?—Yes; there is a system of ventilation carried on; there are apertures by which the foul air is allowed to escape.

4251. And through which the cold air may enter?—I am not sure whether any cold air can enter except by the windows; when there are fires, fresh warm air is introduced.

4252. There is no system adopted so as to ensure a steady supply of fresh warm air, and a regular escape of the foul air?—I believe there is, but the architect will be able to speak to the nature of the system better than I can. I wish to speak only of its practical effect. In my own department we have sufficient ventilation, but the system of warming is not very satisfactory.

4253. Are you aware that any offer was made by the curators of the Bodleian library for the purchase of Mr. Heber's manuscripts?—I am not aware of it.

4254. Did the Museum negociate at all for their purchase?—Yes.

4255. Upon what grounds did the negociation go off?—The parties who acted on behalf of Mr. Heber's representatives did not conceive themselves at liberty to sell the MSS. except by public auction.

4256. Were you present when Captain Sherwell made a statement relative to your inspection of Mr. Upcott's manuscripts?—I was.

4257. Do you desire to make any observation upon it?—There were two distinct offers

offers of those manuscripts made. The first was an offer of a portion of them, of what I considered one of the most desirable portions for the Museum. It included the Dayrolles correspondence, Henry Worsley's papers, and Sir Lionel Jenkins's, and among the last the original treaty of Nimeguen. Mr. Upcott at first asked 470 *l.* for this part of the collection; he then offered to take 350 *l.* The purchase was twice proposed to the Trustees and declined. But with regard to the examination of this part of the collection, I have to observe that the Worsley and Jenkins' papers, and three or four volumes of the Dayrolles correspondence, were in my possession for two months or more, so that I had ample opportunity of examining them; and it is in my distinct recollection that the offer was very fully discussed at a meeting of the Trustees, when there happened to be present persons quite as competent as myself, and indeed much more so, to form a judgment on the value of these political papers and correspondence. With reference to the offer of the whole collection, that was made not in writing, but orally; and as to examination of it, I think I must have been at Mr. Upcott's apartments for an hour or two; but my notions of it were derived rather from the catalogue sent to me than from any personal inspection. Rev. *J. Forshall* 19 May 1836.

4258. Captain Sherwell has stated that that catalogue was a very imperfect one, conveying a very incorrect idea of the collection itself?—I should differ from him in opinion as to its giving a very incorrect idea; I made some notes from that catalogue which are entered in my letter-book, and fill two pages of it. I have seen the catalogue printed since, and I still think that my original idea of the collection was correct; my impressions are not altered by seeing the printed catalogue.

4259. The printed catalogue you allude to is that exhibited here by Captain Sherwell?—Yes.

Martis, 31° *die Maii*, 1836.

MEMBERS PRESENT.

Mr. T. G. B. Estcourt.	Mr. Hawes.
Mr. Thornely.	Mr. N. W. Ridley Colborne.
Sir Philip Egerton.	Lord Stanley.
Mr. Compton.	Sir Robert H. Inglis.

MR. T. G. B. ESTCOURT, IN THE CHAIR.

Mr. *John Holmes*, called in; and further Examined.

4260. Mr. *Hawes.*] HAVE you any observations to make in reference to your former evidence?—I have stated in my former evidence that the manuscripts were examined annually. Such was my belief at the time: I have since ascertained that they have been examined twice during the time that I have been in the Museum, between six and seven years; namely, in 1831 by Sir Frederick Madden, the assistant-keeper; and in 1835, by the Reverend Henry Coxe and Mr. Upton Richards, two of the assistants. Mr. *John Holmes.* 31 May 1836.

4261. What is the nature of the examination when it does take place?—It consists in ascertaining whether the manuscripts are still in the Museum and are forthcoming; it does not apply to the internal state of the manuscripts; I think, not even to the binding; it is an examination of the inventories of the several collections.

4262. In fact, it is little more than counting them over?—It does not, in fact, amount to more than that.

4263. By whom is the examination actually carried on, and to whom is the report made after the examination is concluded?—I have taken the statement which I have made from one of the inventories, which is signed in the one case by Sir Frederick Madden, and in the other case by Mr. Coxe.

4264. But it would be desirable to know the value of the signature. To what does Sir Frederick Madden sign his name, and what kind of security does it confer in reference to the examination itself?—I conceive that his signature, or the signature of the assistants who examined the second time, implies the assertion that the manuscripts still belonged to the Museum, and could be produced.

4265. Who were the parties making the examination?—In the first case, Sir

Mr. *John Holmes.*

31 May 1836.

Frederick Madden, the assistant-keeper of the manuscripts; and in the second case, two of the assistants.

4266. Is the keeper of the manuscripts himself present; does he direct the examination?—He is not present at the time; but he issues directions from time to time.

4267. Does he at all superintend it?—I think that he may be said to superintend the examination.

4268. The only record of the examination is the signature to the book, showing that the number of the manuscripts is correct?—"Examined" such and such a day.

4269. Then there is no regular periodical examination?—No; I was in error when I thought that it was regular. I presume that it rests entirely with Mr. Forshall, the keeper of the manuscripts, to have them examined when he pleases.

4270. Is there any other point you wish to mention?—The second error into which I fell was in stating that all the assistants were paid by the day. I find, however, that one of the gentlemen, the Reverend Thomas Hartwell Horne, has a yearly salary, and is paid quarterly by checques from the Trustees direct. Mr. Horne is in the department of Printed Books.

4271. What is the ground of exception?—Mr. Horne has been in the Museum during a longer period than any other assistant; but he was always paid in that manner. Another point which I wish to explain is this, that where I have spoken in my last evidence in the plural number, I wish to restrict it to the two gentlemen whom I have already named, Mr. Coxe and Mr. Richards.

4272. When you have spoken in the plural number in your preceding evidence, is it to be understood that those gentlemen participate in the opinions you have expressed?—I have not their authority for saying so; but I think that they do.

4273. Supposing there was a classed catalogue of the manuscripts, or rather a classed index, similar to that of Mr. Horne, of the Harleian collection, would it not very much facilitate periodical examination of manuscripts?—I do not know that it would bear upon the periodical examination of the manuscripts. A classed index would be very good, but I think that the catalogues themselves, with the exception of the Lansdowne, the Arundel and the Hargrave, require previous revision. I think that prior to any index being made, the whole of the published catalogues, with those exceptions, require to be rewritten. Although a great deal of money has been spent upon the construction of indexes, I think I could prove that it would be necessary to reconstruct and to rewrite the existing catalogues.

4274. The Committee have been told that that would be a work of perhaps 10 years' labour?—Of course, it would take a great deal of time.

4275. Do you think it could not be done in less time than that?—An index alone, if all the catalogues now in progress were put aside, might be made in that time; but my opinion is, that a classed index, in the present state of the catalogues, would be almost valueless. For the purpose of proving the necessity, in my opinion, of the catalogues being, for the greater part, recomposed, I will hand in the present paper.

[*Producing a paper.*]

4276. This appears the commencement of a classed catalogue?—It is a private paper of my own, and has no official connection with the Museum. For some time I have had an idea that very considerable advantages might arise from putting together the descriptions of different manuscripts of the same works. For this purpose I have had two copies of each of the catalogues cut up. What I now produce is a specimen page taken from a part which is already arranged. It contains the descriptions of several copies of Peter Lombard's Commentary on the Psalter.

4277. But it is the commencement of a classed catalogue?—It is.

4278. Will you inform the Committee why you produce this specimen of the commencement of a classed catalogue; what object you had in view in commencing it?—My object is, as the several portions of my catalogue shall be completed, to present them to the Trustees, for the use of the reading-room.

4279. Your object was then to form a classed catalogue of the manuscripts?—As far as the printed catalogues, which describe upwards of 17,000 manuscripts, will allow me to do so.

4280. And that labour you were undertaking by yourself for the purpose of presenting it to the Trustees, for the use of the readers of the reading-room?—Yes; it is a private labour of my own.

4281. What time do you think, looking at the time at your own disposal, you would be occupied in forming such a work?—No one can be more sensible of the difficulties of forming a classed catalogue than I am. I think it would be almost impossible to state the time in which it could be finished. I began two months ago to select one class, that of the Biblical manuscripts. I now have them arranged in one volume. I am only waiting for the publication of the Burney catalogue, and the catalogue of the Syriac manuscripts, to be enabled to present that class to the Trustees.

4282. Will you describe the mode of forming this catalogue?—I beg to state that I do not produce this page as a specimen of a classed catalogue; I produced it in order to show that in my opinion the existing catalogues ought to be rewritten before an index is made.

4283. Lord *Stanley.*] When did the idea first occur to you of undertaking a new classed catalogue of the manuscripts?—When I received an intimation that I should be examined before the Committee, I thought it probable that I should be examined with reference to the index which had been begun by the Trustees, and has been discontinued.

4284. It was then that it occurred to you practically to examine into the difficulties which might be encountered in such an undertaking?—Yes; I wished to show that it could be done, and that it could be done in the Museum.

4285. What was the object you had in view when you undertook this classification?—I had two objects in view, the one to render a service to the public, and the other to do myself a service with the Trustees.

4286. What was the nature of the service which you proposed to render to the public?—Greater facility in using the manuscripts in the Museum.

4287. You intended to undertake the formation of a classed catalogue of the manuscripts in the British Museum?—Yes.

4288. Will you state when you commenced it, how you commenced it, and what progress you made?—I commenced it between two and three months since.

4289. Mr. *Hawes.*] It was a voluntary labour you imposed upon yourself?—It was so entirely; to be carried on at my own expense and in my own time. I purchased several copies of each of the different catalogues, and had them subdivided by a bookbinder into portions, so that I obtained a separate description of each manuscript; it required, of course, two copies of each catalogue. I then selected, in order to form the first class, all the manuscripts of the Bible, or parts of the Bible in every language; these I fastened on paper in manner shown by the page which I have produced; I then had the volume bound. As two catalogues (the Burney and the Syriac) which contain many Biblical manuscripts, are not yet quite ready for publication, and as I wished to include them in the volume, I did not announce my intention to any one in the Museum, because it might have been laughed at as chimerical, unless I had a specimen volume to produce. I will add, that I wish to show that at least something may be attempted to stop the clamour which is raised against the Museum.

4290. Lord *Stanley.*] Then the operation in which you engaged was simply that of taking the existing printed catalogues of the Museum, arranging them into subjects, and cutting out the present titles and pasting them in a new arrangement?—Yes; of arranging the manuscripts under their subjects.

4291. That is the whole amount of the labour you have imposed upon yourself?—The *first* labour.

4292. Therefore the classed catalogue, when it shall be completed by this labour, will be only a classification of the titles in the present alphabetical catalogue, and any defects in that alphabetical catalogue will of course be copied into the classed catalogue which will be produced by you?—There are two assumptions in that question. The first, that the catalogues now existing are alphabetical; they are not alphabetical, but are numerical. The Museum collection is a chaotic mass of manuscripts; we have perhaps a Hebrew manuscript upon one subject, next to an Italian manuscript upon a totally different subject; there is no order whatever in the catalogues; being made numerically the numbers are the only guide for the arrangement.

4293. Mr. *Hawes.*] In fact they are mere lists, and not, properly speaking, catalogues?

Mr. *John Holmes.*

31 May 1836.

catalogues?—Some of the descriptions of the manuscripts are of great length; they are catalogues, but catalogues made in the order of the numbers, the numbers arising in general from the date of the acquisition of the manuscript.

4294. Lord *Stanley.*] Are the Committee to understand that the present catalogues of the manuscripts in the Museum are merely in that arrangement according to the date at which they were acquired by the Museum, and with no reference either to alphabetical arrangement or to classification under any other head?—There is but one exception to my statement; the catalogue of the Sloane collection, compiled by Mr. Ayscough. With reference to the second part of the question which was put to me, respecting the defects in the existing catalogues being copied into the classed catalogue, I wish to reply by referring again to the paper which I have produced. The manuscripts here described are all of them copies of one and the same work, viz. of Peter Lombard's Commentary on the Psalter; the first is described as a "Commentary on the Psalter by William Paris," which it is not; the second is called "A Commentary of an Anonymous Author on the Psalter;" the third is described as "The Psalter Glossed;" the fourth as "The Psalter of St. Jerome, with the Exposition of Peter Lombard," that is correct; the next is entitled "The Psalter with a Gloss;" the last on the list is No, 346 of the Burney collection, of which the catalogue is nearly ready for publication. It was part of my duty to describe this manuscript, which was imperfect at the beginning and the end, but was evidently part of a Commentary on the Psalter. In order to ascertain its author, I had to examine almost all the early Latin writers on the Psalms, and I also turned over every volume of the great Bibliotheca Patrum, but without success; I then examined some of the manuscripts in the collection, and found it to be the same work with those which I have just enumerated, and which with one exception are erroneously described in the catalogues, and would be entered therefore in an equally erroneous manner in any index whatever. A classed catalogue made in this manner, would not be, therefore, as the question implied, merely a repetition of the errors in the existing catalogues, but, from the juxta-position of the different manuscripts of the same work, it would very often serve, as in this case, to detect the author and correct mistakes. There are here three anonymous works, and one pseudonymous, identified with their author. I would also consider this statement as applying to the question, whether an index would not be advisable.

4295. Mr. *Hawes.*] Then one effect of this classification has been to establish the authorship of some anonymous works, and to correct the authorship in some cases already assigned erroneously in the catalogue?—It has in this case, and it will do so in many others; one great object proposed in the Manuscript department, is to ascertain, if possible, the authors of all anonymous manuscripts.

4296. Therefore the continuation of your labours would serve to correct the existing manuscripts very greatly?—Certainly it would; it would have been of great use in compiling the Arundel and Burney catalogues, and will be so in compiling the future catalogues, which, as completed, may also be dissected and the manuscripts arranged under their several subjects. I intend that my arrangement shall proceed simultaneously with the new catalogues.

4297. There is no doubt of the necessity of an alphabetical catalogue in a great library and collection of manuscripts like the Museum?—An alphabetical catalogue, I think, would be a third catalogue, which might be made after the numerical catalogue and the classed catalogue, or catalogue under subjects, are complete.

4298. You would rank the alphabetical catalogue below a numerical list, and below a classed catalogue?—I think an alphabetical index would do, instead of an alphabetical catalogue.

4299. Lord *Stanley.*] You do not wish it to be understood by the Committee that this classed catalogue which you have undertaken voluntarily, with reference to a particular part of the collection, is the only progress which has been made or is making towards the formation of a classed catalogue of the manuscripts?—Certainly not; I do not know what others may have done, I was speaking of myself only, and of my own labours.

4300. Therefore the Committee are not to understand that in taking this labour upon yourself you took upon you a labour which never had been thought of by any other person in the Manuscript department?—Mr. Forshall's intention is to have a very copious classed index only, or at least an index of matters so full

full that it shall be in some degree another catalogue. My opinion varies from his, because I think that the catalogues themselves must be previously re-written, in order that the index which he proposes may be made with advantage.

4301. Mr. *Hawes.*] That index would be formed out of the existing catalogues, which in many cases are erroneous?—Yes; I did not know till Mr. Forshall gave it in evidence, that he did not think of remaking the Cottonian and the Harleian catalogues; the latter part of the Harleian in particular, I think very bad.

4302. The index which has been alluded to, would not have the effect of bringing together all the works upon the same subject, and thus throwing light upon authorship, or discovering errors which already exist in the catalogue, by attributing the authorship to certain writers to whom it does not belong?—It might to a certain extent; but even for that extent you would have to take the same trouble that you would to make a new catalogue; a new catalogue would be far better than a mere index, however good, because an index could easily afterwards be made to it; I consider a catalogue greatly preferable to an index.

4303. In your last evidence you corrected an error as to the number of charters in the Museum; is there any catalogue of the charters in the reading-rooms?—There is a catalogue of the additional charters.

4304. All of them?—Of about 1,000.

4305. What is the whole number?—About 20,000.

4306. Where are the remaining 19,000?—There is a catalogue of those charters, which is kept in the manuscript-room.

4307. What means have the general readers of knowing the existence of such a catalogue as that?—There are some readers who know of its existence and inform others; I am aware that there is some dissatisfaction existing on the subject; I have heard that Sir Harris Nicolas frequented the reading-room for several years before he knew of the existence of a catalogue of the charters; but it is known to a great many, although it is not placed among the catalogues in the reading-room.

4308. Would the existing catalogues in the reading-room, and those out of the reading-room, give any general inquirer a knowledge of all the manuscripts?—Not at all; there are some of which the catalogues are not yet in the reading-room, nor are the catalogues ready for use.

4309. The Committee have been told that all the manuscripts have been catalogued, with the exception of about 200; now are the Committee to understand that the readers have a knowledge of all those manuscripts except those 200?—Mr. Forshall did not mean that, nor could he intend that inference to be drawn; he is correct in stating that notices exist of the manuscripts either in the catalogues or in the list of printed additions, or in the manuscript catalogues; but there are a very considerable number of manuscripts, of which the readers have not yet a knowledge.

4310. Is there not a great distinction between catalogues and lists of additions?—The catalogues describe the manuscripts; the lists cannot be said to describe them.

4311. Are the lists numerous?—There are the lists of additions for seven years.

4312. Of course without any arrangement at all?—They partake of the same arrangement with the rest of the collection of manuscripts; the numerical arrangement.

4313. Lord *Stanley.*] Is not that numerical arrangement the arrangement adopted in most foreign libraries?—In most.

4314. Mr. *Hawes.*] That does not in your mind prevent the necessity of introducing improvements in the British Museum, does it?—No, I do not know that it is an argument either way; it is a fact; but there are some libraries which attempt a rough arrangement. Bandini, for instance, in his catalogue of the Florence library, has Bibles together and classics together, and the Italian manuscripts together.

4315. Those annual lists are only privately printed, are they?—They are printed for the use of the Trustees; a copy is also sent to each officer of the Museum, and to every donor; they are not sold.

4316. Can the general visitors of the Museum purchase them?—No.

Mr. *John Holmes.*

31 May 1836.

4317. Can the public purchase them?—No.

4318. Mr. *R. Colborne.*] How many copies are printed?—I believe 250 are printed; I speak from the Returns before The House.

4319. Are all those 250 circulated?—There are about 45 sent to the Trustees, and about 16 to the officers. The donors are very numerous; every person who sends a gift, has his gift recorded in this list of additions, of which a copy is sent to him.

4320. Merely of that year?—Merely of that year.

4321. Lord *Stanley.*] The principal object of that is, that the donor may have an opportunity of seeing that his gift has been received and properly recorded?—I conceive so.

4322. Mr. *Hawes.*] Would it not be a great advantage to the public, if in each manuscript a description of its contents, similar to that given in the catalogue, were added?—I have heard that mentioned by Sir Harris Nicolas; it would certainly be advisable, as it would supply, in some degree, the place of a table of contents to each manuscript.

4323. Could it be done without much trouble; and would it not be a benefit to the readers?—It would certainly be a benefit, and it might be done by the sacrifice of two copies of each of the catalogues.

4324. Will you state whether or no it would be easy for a list of all the manuscripts in numerical order, preparatory to a general or full catalogue, to be placed in the reading-room, and to be completed periodically, say every three months?—It would give the readers a knowledge of what acquisitions were made to the Museum during every three months; I do not think that it would be possible to keep the catalogues up to that point; a list of additions might be made, and would be very useful, but a catalogue could not often be compiled in that time; there are many manuscripts which require a long time to describe them accurately.

Mr. *Joseph Harding*, called in; and Examined.

Mr. *J. Harding.*

4325. Mr. *R. Colborne.*] YOU are a bookseller and publisher in a considerable way of business and long established?—Yes.

4326. You have of course given you attention to such collections of curious books and manuscripts as are offered for public sale in London?—I have.

4327. Are such sales chiefly attended by booksellers?—Very generally.

4328. Do you know anything of a practice, said to be common, according to which booksellers agree not to bid beyond a certain point against one another, and to compete privately among themselves for the lots purchased?—I believe it to be very common; but I beg at the same time to exempt myself from that practice.

4329. But you feel confident of the fact?—I know it to have existed I have been in communication with the Excise relative to it.

4330. Does not it turn out, that after that sale there becomes in fact a second auction among the booksellers themselves?—I believe it is so.

4331. Does not it act then as a sort of fraud and trick upon the revenue?—I think it a decided fraud, not only upon the revenue, but upon the owner of the property which is exposed for sale, and destructive of every feeling of honesty and respectability among the parties concerned in it. I have not known a single man that has entered into that illicit trade extensively, ever to be a rich man, to be a man of property or reputation.

4332. Then your opinion is, that the Trustees of the British Museum could not join in any arrangement of that kind with any degree of credit to themselves or justice to the public?—Decidedly not.

4333. You feel confident that this is a habit that goes on, though you say, yourself, you have never entered into it?—I do not say that I never have; and it is necessary, in exculpation of myself, to explain when and how I was concerned in it. Some years ago I took a partner, who was engaged in it for a time. He turned out dishonest, and I got rid of him. That is the only period that I ever was connected with it, and therefore I do know that it did exist, and I believe it to exist now.

4334. Do you happen to know if this is a habit which dealers in other articles besides books, for instance, pictures, or any other works of art, likewise adopt?—I believe it to extend to most sales by auction.

4335. Your

3,55

Mr. J. Harding.

31 May 1836.

4335. Your attention is requested to the following question and answer, in the evidence of Mr. Thorpe. In No. 3225, this question is put, "Have you made any offer to the Trustees to buy manuscripts on commission?" His answer is "Yes; I offered to Mr. Forshall to buy for them, at 10 per cent. commission. What advantages did that offer to the Museum?—I think if they were to employ me for things which I buy, and other persons in the line in which they buy, they would probably save a great deal of money by it. Is that upon the notion that the officers of the Museum bidding at a sale, being known as purchasers for the national collection, are more likely to be run up?—I think, probably, a greater value is set upon the thing when they bid for them." Now, what is your opinion of those statements?—I do not think that they would obtain manuscripts upon nearly so good terms as if they were to bid straightforward for themselves, because, if a party or parties were dishonest enough to compete in this way, for the possession of the property, they might also be dishonest enough to combine, between themselves, to prevent that property from being sold at a fair price, and probably would themselves run it to three, four, or possibly 10 times its real value; and if a per-centage were added upon that excess of value, the Museum, and consequently the public would be losers to that extent.

4336. Mr. *Hawes.*] Do you think it at all uncommon in sales to employ an agent, who does not proclaim his principal in the room?—It is very general.

4337. Do you think there is any dishonesty in that?—None at all; I think it correct, and very judicious.

4338. Do not you think an agent bidding, without its being known who his principal is, often purchases more advantageously than he would if he proclaimed that his principal was a very wealthy buyer?—Very often; but if that agent is not an honest man, I apprehend the principal will stand a good chance of being swindled by a combination between two dishonest agents, that is, by his own agent, and also by his agent's associate.

4339. Why should you assume the agent to be dishonest?—I do not assume it; but I have been asked whether a combination does not exist, for the purpose of preventing property being sold in a fair way, and I have stated that I believe it does exist, and any imputation of dishonesty would apply only to parties who engaged in such practices, supposing them to exist.

4340. You have been referred to an answer of a former witness, in which it is stated, that had the Museum employed an agent instead of bidding by its officer, they might have saved a great deal of money. Do you mean to say that that is not a correct statement?—I do, coupled with the combination upon which I have been questioned, and which I have before stated I believe to exist between parties, to prevent property being fairly sold in the sales.

4341. Do you mean to say that there is a combination between parties to prevent the fair sale of manuscripts and books generally?—I should say that I believe it frequently exists. It is not confined to that class of property, but I believe it extends to all properties. At a sale of pictures, at Christie's, some years ago, there was a combination of that description. The parties engaged in it *split* between themselves, even before they got out of Christie's, and they actually had a quarrel in King-street.

4342. Who suffered by that?—I apprehend the Excise and the proprietor of the property; because this must have been a combination to depress property, and obtain it at an undervalue.

4343. But not the buyer?—The buyers were themselves.

4344. The buyer gained by this proceeding, according to your account?—I do not see that; the parties who thus obtained the property, could not fairly be called buyers.

4345. Mr. *R. Colborne.*] Do you think the plan that is adopted now by the British Museum is the fittest and best, namely, that of sending their own people to buy?—I think it most decidedly the best way for obtaining things, and eventually the cheapest: I once received a communication from the librarian of the greatest university library in England, highly illustrative of the extent of the evils attending the practice of combining at sales; it stated that in consequence of such combinations he had been driven out of the market, and had been induced to send his commissions to a foreign country, considering that course less injurious than to submit to imposition. The communica-

Mr. *J. Harding.*

31 May 1836.

tion was from Dr. Bandinel, the keeper of the Bodleian Library, Oxford, and refers to a transaction four or five years back.

4346. Do you mean that Dr. Bandinel, on the part of the Bodleian Library, has never bid for books through an agent?—I do not mean that; I mean that he had been driven out of the market by such a combination, and had deemed it more honourable and less injurious to send commissions to a foreign market, than to submit to imposition.

4347. Does not he continue to employ an agent?—I have no doubt that he does, when he deems it advantageous for the library under his custody.

4348. You think it advantageous that principals should always buy in their own names at public sales; that it is the most economical mode of making purchases?—I think it the best mode, upon the long run; and where opulent parties, like the British Museum, are constantly coming into the market, and possess the means of defeating combinations, by dropping articles, at high prices, upon parties who they have reason to believe are combined against them, such a course would prevent frequent combinations.

4349. Mr. *R. Colborne.*] Do not you think there might be a danger of the price being run up, when it is known that so strong a purse as the public purse comes into the market. Would not the seller be inclined to run the price a little higher?—I think it very likely; it would be difficult to make a rule without any exception to it; but my answer to the preceding question applies equally to this, and I beg it to be understood, that the remarks I have necessarily made in reply to these questions, are not intended to attack any individual persons, but to an iniquitous practice, and to unprincipled traffickers in such a practice, which is called a *rig*, and which could not exist 12 months, if properly looked after by the Excise, and a short Bill passed applicable to the case. The principal part of the most valuable pictures in the kingdom are purchased by commission. It depends entirely upon the reputation and the honesty of the agent.

4350. For instance, if we wanted to buy pictures abroad, would it not be rather an unwise thing to send out and bid for ourselves?—I think it would.

4351. The fact is that it depends a great deal upon the character and honesty of the person employed?—Very much. But with reference to book-sales and sales of manuscripts generally, I think the bidding openly for what is wanted, a more probable means of getting things at a fair price in the course of years by parties like the British Museum, who are constantly in the market, than by employing an agent. That answer does not apply to the question of making purchases of pictures abroad, because the parties who are most likely to combine at public sales for books would not be the most reputable part of the trade, and would not have very long purses, and therefore, upon a long series of sales and purchases, they would be beaten out of the market, or be frequently compelled to buy them themselves at ruinous prices, at which they could obtain no profit.

4352. Where a person goes to bid for a large body like the British Museum, is not it soon found out by other dealers?—If the British Museum were to bid in that manner, I apprehend they would upon one occasion employ one person, and upon another occasion another person, so that they would not be traced.

4353. Mr. *Hawes.*] Did you ever hear of the British Museum employing an agent?—Frequently.

The Rev. *Josiah Forshall,* called in; and further Examined.

Rev. *J. Forshall.*

4354. Lord *Stanley.*] WHEN were you first appointed to a situation in the Museum?—In April 1824.

4355. When to your present situation?—In December 1827.

4356. Did you fill any public situation before you came to the Museum?—I was tutor in my college at Oxford, one of the largest colleges in the university, for four or five years; and for two or three years before I came to the Museum I was also librarian to the college.

4357. By whom were you recommended to the Museum?—I had no recommendation to the principal Trustees, except from such persons as knew me at the university. I had no aristocratic or Parliamentary influence whatever, at least none such was exerted on my behalf.

4358. Your

337

4358. Your recommendation, therefore, must have been your character at the university?—Entirely.

4359. Since you have taken charge of this department, at the end of the year 1827, what additions have been made to the collections of manuscripts?—I think there have been about 4,500 volumes added.

4360. What was the total number of volumes when you first took charge of the department?—About 19,000, and of the subsequent additions about 3,500 have been purchased by the Trustees without any extra aid from Parliament, or the direct interference of Parliament.

4361. When you say purchased by the Trustees, upon whose judgment and whose advice have the Trustees acted in the purchases they have made in the Manuscript department?—Upon mine and that of my colleague, whom I usually consult previously to any purchase of importance.

4362. Is not the general rule with regard to all purchases in the Museum, that the Trustees make the purchases upon the recommendation of the officers at the head of the respective departments?—It is.

4363. As secretary to the Trustees you have an opportunity of knowing upon whose recommendation, and under what circumstances, almost all purchases have been made, and you state that to be the general rule which has guided the conduct of the Trustees?—I do.

4364. Mr. *Hawes.*] Do you state that all purchases are made upon the recommendation of the officers of the Museum exclusively?—I scarcely ever knew an instance in which a purchase was made not recommended by the officers of the Museum.

4365. Are they originated by the officers?—Not always.

4366. Lord *Stanley.*] There seems to be some doubt with regard to the meaning of the word recommendation; are the Committee to understand, that upon an offer being made of a manuscript, or of any other article for purchase by the Trustees, the recommendation and advice of the officer at the head of the department is taken, as to whether the purchase is advisable or not?—It is almost always so, and in cases of importance there has never been an exception, in my experience.

4367. And without such consultation with the officer at head of the department, the Trustees have scarcely ever made a purchase?—Scarcely ever; I have not known an instance in which the Trustees have made a purchase without consulting the proper officer. They have frequently declined purchases which have been recommended by the officers, but only in consequence of want of funds, or, generally speaking, from some other similar cause.

4368. That is to say, they have declined making purchases which the officers have stated to be desirable, from motives of economy and want of funds?—Yes.

4369. Since you have had the charge of the Manuscript department, what additions have been made to the establishment?—There have been considerable additions. When I first came, in 1824, there were two officers, Sir Henry Ellis and myself, the keeper and assistant keeper of the department, and one attendant. In June 1826 another attendant was added; in July 1831 a third attendant; so that we have now three attendants belonging to the department instead of one. We have now also several gentlemen of considerable literary attainments who give their assistance in the labours of the department. The first of these was added in July 1829, a second in January 1830, a third in May 1833, a fourth in June 1833, a fifth in May 1834, and a sixth in February 1836. But I should explain, with regard to the last two of these gentlemen, that they do not give the whole of their time to the Manuscript department, it being inconvenient to them, or more correctly, to one of them, to do so.

4370. Are those gentlemen to be considered upon the permanent staff of the Manuscript department, or are they engaged in particular works, for which their services were especially thought desirable?—Not upon the permanent staff, but rather as supernumeraries. In fact, almost all the assistants in the Museum are at present considered rather in the light of supernumeraries than as upon the permanent staff. But the subject of the organization of the Museum in respect to this branch of its staff has been for some time past under the consideration of the Trustees, and I have no doubt some of these employments will be put upon a different footing.

Rev. *J. Forshall.*

31 May 1836.

4371. Were you rightly understood that, in 1827 and 1828, the only persons charged with the Manuscript department were Sir Henry Ellis and yourself?—The only persons charged with the ordinary duties of the department were Sir Henry Ellis and myself. In 1828 I found Mr. Millard also employed upon the index of the manuscripts.

4372. That also was a special service?—It was.

4373. In what state was the collection of manuscripts in 1827; what room was there for the keeping of them; what provisions for their custody, and what was their arrangement?—In 1827 the manuscripts were removed from the old building into the room where the chief part of them are at present deposited. Before that time they were scattered over three or four rooms in the old building, some of which were used as reading-rooms. These rooms were generally inconvenient; one of them was so dark that in the brightest day a tin reflector was used to find the manuscripts.

4374. For want of space they were not generally accessible, and of course not capable of being properly classed and arranged?—Not so easily accessible as at present. They have always been arranged as they are now; that is, according to the numbers by which they are designated, and this is the best arrangement for manuscripts. It is scarcely possible, without unbinding and even cutting up manuscripts to make anything like a regular classification of them upon the shelves of a library, seeing that 10 or 12 manuscripts upon very different subjects are not unfrequently bound in a single volume, and sometimes several written upon the same fasciculus of paper or vellum.

4375. In 1827 you obtained the present accommodation you have for the manuscripts?—Yes.

4376. Is that accommodation sufficient?—Quite sufficient for the stowage and arrangement of the manuscripts; and I think, when the design for the Museum is completed, we shall have room for accessions of manuscripts during the next 40 years, supposing that we proceed at our present rate of acquisition, and with this additional space also all other necessary conveniences.

4377. Have you at present sufficient and convenient room for unrolling, examining, and decyphering manuscripts?—Not quite so much as I should wish to have. We want some additional small rooms attached to the department, but much greater space will be afforded in the course of next year, when the reading-rooms will be removed to the north side of the building, and the present reading-rooms devoted entirely to the Manuscript department.

4378. Do you consider a classed catalogue of all the manuscripts desirable for the Museum?—I consider a very good, full and accurate catalogue of all our collections very desirable, indeed essential to the proper utility of the Museum; but I do not consider a classed catalogue of the manuscripts as at all essential, or perhaps even desirable. It would be a work of very great labour to make an accurate classed catalogue of all the manuscripts of every description, and one that I think would be attended with no adequate advantage; but a full and detailed index, both of authors and subjects, with copious cross references, is very desirable indeed; and I have long designed such an index, and thought that certain parts of it might, with advantage, be printed separately; for instance, the part which Mr. Holmes has just referred to, the Biblical MSS., for which separate index of these Biblical MSS. I made not inconsiderable preparation some years ago, The classical manuscripts might also be printed separately; the manuscripts relating to British history separately; and the heraldic and genealogical manuscripts separately; so that these separate indexes, so far as they extend, would be classed indexes to manuscript collections, but I do not think that it would be desirable to classify all the manuscripts in this way, and to print indexes upon every branch of knowledge separately. Treatises upon or MSS. relative to canon law, or many branches of theology or alchemy or astrology, and any subjects which are not of common or decided interest, might be deferred until the general index was published.

4379. Since you have been in the Museum, what progress has been made towards cataloguing the manuscripts, and when was the subject first taken in hand?—The catalogues have been proceeding ever since I came into the Museum, and indeed I presume that they have always been in progress, but the progress has been much more rapid within the last eight or nine years, as might reasonably be expected, seeing that I have had the assistance of an extended

Rev. *J. Forshall.*

31 May 1836.

tended establishment. A catalogue of the Arundel manuscripts has been entirely made and published. We have completed in manuscript a catalogue of the Burney manuscripts, and printed it within a sheet or two. A catalogue of about a third part of the Sloane and additional manuscripts has been completed in manuscript. One half of the labour has been gone through, which is necessary to make a complete catalogue of the Oriental manuscripts. We have printed annual lists of the additions to the collection, to the amount of about 2,500 volumes.

4380. Mr. *Hawes.*] Are those printed lists accessible to the public?—They are placed in the reading-room for the use of the public.

4381. Can they be purchased by the public?—No.

4382. Is there any index to them?—No.

4383. Then in order to find any particular manuscript, you must search through the whole number of volumes?—Yes.

4384. How many volumes are there?—Four at present.

4385. Containing how many manuscripts?—About 2,500.

4386. Are those lists printed exclusively for the use of the Trustees?—Not exclusively for the use of the Trustees, but for the use of the public in the reading-room, and of the officers and other persons employed in the Museum, and for the use of the benefactors to the Museum during the year.

4387. Lord *Stanley.*] You mean to say that the annual lists include in the whole 2,500 volumes, but each of the annual lists contains all the additions made within the year?—Just so.

4388. Sir *Robert Inglis.*] In point of fact they are merely provisional catalogues, waiting to be absorbed in the general catalogue, which is in preparation?—To be amplified very considerably in the general catalogue.

4389. Lord *Stanley.*] Will you go on to state the progress which has been made towards cataloguing the manuscripts?—A catalogue of the manuscripts in the library of King George the Fourth has been made by Sir Frederic Madden, and a catalogue of all the charters which have been added since I became keeper of the manuscripts has been completed and is ready for being printed whenever the former catalogue is sufficiently correct. Several additions have been made to this old catalogue of charters and numerous corrections. Considerable materials have been collected for a supplement to the Cottonian catalogue. The Pipe Rolls, transferred by the order of the Commissioners of Records to the Museum, have all been examined; the membranes have been counted, and a list of them has been printed, and something like 8,000 volumes of MSS. have been paged. The papyri have been also transferred from the department of Antiquities to that of MSS., and numbers of these have been unrolled, pasted down, and framed or otherwise secured.

4390. What is the nature of the catalogues of those parts which have been completed?—The catalogue of the Arundel manuscripts will give the best idea of the manner in which it is intended to print the others. There have been a few improvements introduced into the plan of this catalogue; for example, with regard to such manuscripts as have been printed, the fact is stated, and when and where they have been printed.

4391. The catalogue contains, with respect to each manuscript, a very full and accurate account of the manuscript itself and its contents, and any bibliographical notices?—Yes, a full and accurate account of the contents of the MS., and a notice of its age and its state; but not, generally speaking, any critical notices with regard to the work described or its author.

4392. Have those catalogues indexes attached to them?—The old catalogues have, and the new catalogues will have when a volume is completed.

4393. Does not the work of attaching an index to a catalogue, after the catalogue is completed, bear a very small proportion to the labour of making the catalogue itself?—Very small indeed; if the catalogue be well made, not one-tenth part of the labour is required to accomplish it.

4394. In what manner are the manuscripts arranged in the catalogue?—They are arranged according to the numbers attached to the manuscripts, just as they may happen to have been arranged when the collection was first formed. When any number of manuscripts are brought to the Museum, which have not been numbered and arranged before, then we attempt to classify them, beginning with theology, and proceeding to jurisprudence, philosophy, history, biography, heraldry, poetry, and so forth. But the Museum manuscripts are,

Rev. *J. Forshall.*

31 May 1836.

for the most part, already numbered, and many of them known throughout the world by those numbers.

4395. You mean to say that particular valuable manuscripts are known by certain numbers, and that a different arrangement of those would cause considerable confusion in the literary and scientific world, with reference to those manuscripts?—It would create very great confusion.

4396. What do you consider still remains to be done in the way of cataloguing the manuscripts?—We shall complete the catalogue of the Burney manuscripts very shortly, and probably then print the catalogue of the manuscripts in the library of George IV. A new catalogue of the Sloane collection, and a catalogue of the additional manuscripts must be printed; a catalogue, too, of the Oriental manuscripts, the Syriac part of which is nearly finished.

4397. With reference to the Syriac manuscripts, one of the gentlemen engaged *pro tempore* is engaged upon those?—He is, Dr. Rosen.

The catalogue of the charters should be printed. This is an important work, and one which I should be glad to see completed without delay. The catalogue of the Royal MSS. should be remade; a supplement to the Cottonian catalogue printed; the Harleian catalogue revised; and then a general index to all the collections should be formed and printed.

4398. Would you in all cases think it desirable to postpone the index till the whole of the catalogues shall be complete?—I purpose to print an index to each volume of the catalogue as it is produced. But with respect to the general index, the arrangement to be adopted must depend upon the funds at the disposal of the Trustees. If the Government allow us to spend considerably more than we do at present, and thus bring the completion of our catalogues within three or four years, I should then defer the whole of the general index till we complete our catalogues; but if we go on at the same rate of expenditure as we do now, I think it might be desirable to print certain classes of the general index before we are able to print the whole of it in one series.

4399. Are those catalogues generally accessible to the public that visit the the Museum?—Generally speaking, they are so; those that are complete, are so.

4400. Are any of them open to public sale?—All the catalogues that have been printed by the Trustees are open to public sale.

4401. Sir *Robert Inglis.*] In stating the general object which you propose to yourself, in order to produce a complete set of catalogues, to be used in the British Museum, do you or do the Trustees adopt any plan which you know to have existed in any other institution in the world, or do you form these plans with a view to render the British Museum the most perfect in the world. In other words, do you know whether in the Paris or in any other library whatever, there exists such facility as that which you propose to afford to the readers in the British Museum?—I look to the greatest advantage to the public which is within the compass of any means which can reasonably be expected; —to such facilities of reference as I believe do not exist in any large and national library in the world.

4402. Mr. *Hawes.*] Do you know any country that has the same means for such purposes at its disposal?—No; and I think it much to the disgrace of Great Britain, with the means at its disposal, that so little has been done in past times for the Museum and its collections, and for other institutions similar in their objects.

4403. Therefore, reasoning from the imperfections of other institutions is not to be taken as any argument against improvements in the British Museum? —Undoubtedly not.

4404. Sir *Robert Inglis.*] The answer which you gave to the former question put by me, implied that you were not viewing the deficiencies of other museums, or the attainments of other museums, as any reason why you should or should not adopt a particular plan; but that you have adopted the plan which you propose to yourself, with a view to render the British Museum in itself as nearly perfect as you can?—Certainly.

4405. Was that the inference which you wished the Committee to draw?— Yes, it was.

4406. Mr. *Hawes.*] Is there a catalogue of the charters in the British Museum?—There is.

4407. And placed in the reading-room?—It is not always in the reading-room, but very frequently there; it is deposited in the Manuscript department.

There

There is but one catalogue, and we have frequently occasion to refer to it in the department.

4408. What means has the general reader of knowing the existence of such a catalogue?—The keeper of the reading-room would inform any person of its existence who wanted to consult it.

4409. There are no other means, then?—No other than I have described; but the inquirer would naturally presume that a catalogue existed, if he wanted to consult any public collection of charters whatever.

4410. Sir *Robert Inglis.*] And if he asked the question of Mr. Cates, in the reading-room, would Mr. Cates as a matter of course inform him?—Yes.

4411. And in fact the question would be as much a matter of course as the answer?—Exactly so.

4412. Mr. *Hawes.*] There are about 20,000 charters?—There are.

4413. What proportion of those are contained in the catalogue, which is usually kept in the Manuscript department?—I should think nearly 18,000.

4414. The catalogue of about 18,000 of the charters is out of sight and out of reach of the general reader?—Not out of the reach of the general reader, but out of sight, until he inquires for it, unless it should be in the reading-rooms at the time.

4415. You do not take any means to inform him that there is such a catalogue?—No; beyond what I have already explained.

4416. Sir *Robert Inglis.*] You have stated that the collection consisted of 19,000 manuscripts when you became keeper of the department, and that you have added 4,500 since, and that you have formed the catalogues to the extent which you have described. Do you wish the Committee to understand that such an increase, amounting to about one-fourth of the manuscripts formerly in the possession of the Museum, and such an addition to the catalogues, justify the hope and belief that there will be a corresponding rapidity of progress, in the years to come, both in forming the collection and in completing the catalogues?—Yes; I think it gives the greatest hope, and furnishes strong grounds for public confidence. A much more rapid improvement has taken place within the last seven years than in any like space of time previously, and the improvement during these seven years has been progressively rapid. I can give an illustration, if the Committee wish it, by stating the number of manuscripts purchased by the Trustees, during several periods, from the foundation of the Museum up to the present day. In the 26 years that had elapsed previous to 1782, there were not more than 50 manuscripts purchased, and made accessible to the public. In the next 30 years, between 1782 and 1812, there were 350; between 1812 and 1828 little more than 150 were purchased; and since 1828 there have been about 3,500 purchased. I speak of purchases by the Trustees, exclusive of those which have been made with special grants by Parliament, such as those of the Burney, the Hargrave, and the Lansdowne collections.

4417. Lord *Stanley.*] Who is charged with the custody of the manuscripts in the British Museum?—They are in my charge, and in that of my colleague, Sir Frederick Madden.

4418. Have you ever had the misfortune of losing any manuscripts?—Never; I have never lost a single manuscript since I have been keeper of the department.

4419. You consider that they are completely safe?—Quite safe.

4420. Mr. *Hawes.*] Who has the custody of them at this moment, while you and Sir Frederick Madden are absent?—I have the custody of them.

4421. Do you mean that they are locked up?—No, the attendants have the keys, and when I go back I shall see that the department is safe.

4422. Lord *Stanley.*] Are you responsible for their safe custody?—I am responsible for their safe custody; if a single manuscript were to be lost, through any want of care, I should have to make it good, if it could be made good, or to pay its estimated value; and therefore, for my own sake as well as for the sake of the public, I of course exercise great caution.

4423. Comparing the collection of manuscripts at the British Museum with other great collections, what rank do you consider it to hold?—The Paris collection is probably much more extensive; what the Vatican contains it is difficult to know; but with those two exceptions, I should think the collection in the British Museum, was the most numerous in the world.

Rev. *J. Forshall.*

31 May 1836.

4424. In point of value?—I am unable to state what the rank may be in point of value; but in large manuscript collections, the value may be considered nearly proportionate to the number of the volumes. There is a very great difficulty in ascertaining the number in foreign collections, whether of manuscripts or of printed books, and likewise indeed, in the collections of our own country. The Committee have had already one instance of widely-circulated error brought before them, in the case of the Harleian charters and rolls, which, in the authorised publications of the Museum, were enumerated at 40,000, though they do amount to scarcely 16,000, or thereabouts. There are two other curious instances of the same kind of error contained in the volume which the Committee have printed. The one, at page 399, where the printed books of the Museum are reported officially, some 15 years ago, to amount to nearly 200,000; whereas, at page 385, they are enumerated, in 1823, as 125,000, and with the accession of Sir Joseph Banks's library, and the library of George the Fourth, which together must be upwards of 80,000 volumes, and with all the additions that have been made from year to year since, they do not amount now to more than 240,000, if to so many. Another instance exists in the letter of King George the Fourth, written when His Majesty presented his library to the British nation, in which his library is stated to consist of 120,000 volumes. When it came to be counted, it was not more than between 60,000 and 70,000.

4425. Mr. *Hawes.*] That arises from titles being sometimes taken for volumes, does not it?—It may be so, and generally speaking, unless volumes are actually counted for the purpose of ascertaining what the number in a library is, there is very little dependence to be placed upon any commonly-reported account of the extent.

4426. Have the volumes been actually counted in the Museum?—Yes; I know that the manuscripts have, and I believe the printed books have.

4427. In the case of the King's library, were there not many books kept back by the King?—Not many; there were some ten or twelve.

4428. Lord *Stanley.*] We have heard something about some offer made by Mr. Thorpe to the British Museum, for the purchase of manuscripts belonging to him. Will you state whether such offer was made, and under what circumstances?—Mr. Thorpe has, upon two or three occasions, made an offer of the Battle Abbey muniments, and I have several times spoken to him upon the subject. In reference to question 3217, where Mr. Thorpe says, "I never had any communication with him (Mr. Forshall) upon the subject, more than he once said, 'I am very sorry we cannot buy them; we ought to have them, but we have not the money;' and what is more, Mr. Forshall never saw the collections," and so on, the Committee will, perhaps, allow me to put in an extract from my Report of November 10th, 1832; they will see from this that those manuscripts were examined by me more than once, and that in my Report I brought them fairly under the consideration of the Trustees: "Mr. Forshall, in compliance with the wish of the Trustees, has again examined into the collection of muniments relative to Battle Abbey, offered to the Museum by Mr. Thorpe. These evidences consist of about 1,100 charters and other deeds, and of 700 rolls; the former comprise grants, confirmations, agreements and awards, acquittances, leases, powers of attorney, wills and bonds; the latter of rentals, stewards' accounts, accounts of the officers of the monastery, and rolls of the hundred court and courts baron. They seem to relate to the chief endowments of Battle Abbey, and their dates range from the reign of the Conqueror to that of George II. Mr. Forshall has no hesitation in saying that the collection is, in its kind, unrivalled, and that it is highly valuable, as furnishing large materials for illustrating the history of the families and places to which the deeds refer."

4429. The purchase, however, was not made?—It was not.

4430. Can you state upon what ground it was not made?—It arose from some difficulty which the Trustees had, either about the price or about their own funds.

4431. Does the collection still remain in the possession of Mr. Thorpe?—It does; there is another point connected with Mr. Thorpe's evidence to which I would beg to refer. It is question 3223: the question is, "Have you at any time had any transactions with the Museum?" In answer, "Perhaps I may have sold them 100*l.* of manuscripts in the last 20 years." I believe Mr. Thorpe was

was not very extensively known 20 years ago as a dealer in manuscripts; but I have before me an account extracted from our books of the manuscripts purchased from Mr. Thorpe during the last four years. In 1832, we purchased manuscripts from him to the amount of 40*l.*; in 1833, to the amount of 54*l.* 3*s.* 6*d.*; in 1834, of 14*l.* 3*s.* 6*d.*; and in 1835, of 28*l.* 14*s.* 6*d*, amounting, in these last four years, to 137*l.* 1*s.* 6*d.*, and I believe there has been some trifling purchase this year.

4432. Have you purchased on the part of the Museum several manuscripts at public sales and public auctions?—Very frequently; I have generally preferred to attend sales myself rather than to employ an agent, partly on the ground which has been stated by Mr. Harding to the Committee, that the sales of manuscripts by public auctions are frequently not fair sales; that there is a combination among the booksellers, so that no private bidder can obtain any lot he wishes at a fair price; the booksellers do not bid against each other to the same extent that they bid against any private individual, on the understanding that the lots purchased are to be resold among themselves. There was a very intelligible hint given to me soon after I became keeper of the manuscripts, that if I would consent to purchase exclusively through certain booksellers, such manuscripts as the Museum required might be obtained on the payment of a small commission; but I rejected the idea at once, considering that the system to which I should to a certain extent become a party was objectionable in principle, and also that the pecuniary interests of the Museum would be better served by a different course; my subsequent experience has established this last point so as to leave no doubt whatever on my mind.

4433. There was a considerable purchase made by a special grant, authorised by the Treasury in the course of the present year, of Mr. Heber's manuscripts?—There was.

4434. Did you purchase then by yourself, or by commission?—The manuscripts were purchased by myself and by my colleague. During the first three days of the sale I made the purchases myself; my colleague attended the sale afterwards, because I was too unwell to do so.

4435. Did you there obtain very valuable manuscripts at fair and reasonable prices?—At a fair and reasonable rate; the manuscripts certainly sold at high prices, and that owing to two or three causes; there was a commission from Paris, the Belgian minister gave some commissions, and Sir Thomas Phillips, who is a bold purchaser of manuscripts, was also in the market.

4436. Supposing it had been known that the British Museum had a Parliamentary grant of 2,000*l.*, to be expended at that sale, do you think you would have obtained the manuscripts you did obtain upon the same reasonable terms?—I endeavoured to conceal the exact amount of the grant; but it was well known that we had a considerable sum to spend. It is almost impossible to conceal a fact of that kind for any length of time.

4437. Was not very considerable surprise expressed a little while ago, and something approaching to disappointment in the trade, that the British Museum was not a bidder for a celebrated Bible that was for sale?—There was, as indeed is indicated by some passages in the evidence given to the Committee.

4438. Will you state at what price that Bible was bought in?—It was bought in at 1,500*l.*; the Bible to which you refer has been under my notice the last seven years.

4439. Then, in point of fact, it was not a *bonâ fide* sale for 1,500*l.*?—No: I believe there was no *bonâ fide* bidding.

4440. What was the first price asked for that Bible of the British Museum?—The price mentioned in 1829 was 2,500*l.*; but the price asked for it by the proprietor when he came to England in the present spring was 12,000*l.*; his next offer was 10,000*l.*; he then reduced the sum to 8,000*l.*, and subsequently to 6,500*l.*

4441. Under those circumstances, the Trustees then declined the purchase of that Bible, preferring to take the chance, if they should think it desirable, of purchasing it after it should be exposed to public sale?—Exactly so; the Bible is still on sale.

4442. The result of that transaction has been that for a Bible for which 12,000*l.* was asked of the British Museum, no person at a public auction has been found willing to give 1,500*l.*?—That is the case.

Rev. *J. Forshall.*

31 May 1836.

4443. Do you consider yourself that that Bible is worth 1,500 *l.*?—In my opinion, I could spend 1,500 *l.* much more advantageously to the public.

4444. Do you think that 1,500 *l.* is an extravagant price for that Bible?—I think it is a very high price.

4445. Then you believe that at an auction, as a buyer, you would not have felt yourself justified in bidding for that Bible the sum at which it was bought in?—I should not have felt myself justified in offering that price.

4446. Sir *Robert Inglis.*] You have stated that the collection at Paris, in the Bibliothèque du Roi, is probably more extensive than that in the British Museum; what evidence have you, or what evidence has any one from catalogues or lists, that that collection is more extensive?—The catalogue printed in the middle of the last century, and particularly the memoir prefixed, may be some evidence to the point, as well as an Essay on the Library by Le Prince, printed in 1782.

4447. You mean the catalogue of 1744?—Yes; there are between 16,000 and 17,000 manuscripts described in that catalogue: then we have printed accounts of the Sanskrit manuscripts in the catalogue published by Hamilton and Langlés, and of the Italian, in that recently edited by Marsand; so that I can hardly doubt that the Royal Library at Paris must contain 50,000 or 60,000 volumes of manuscripts; the Returns furnished to the Committee state the number at 80,000, and elsewhere the number given is less. They have a great many manuscripts I know which are in need of being bound; in the report to M. Guizot, 10,000 volumes of manuscripts are said to require it urgently. The librarians are therefore, it is probable, not very accurate as to what constitutes a volume.

4448. Is not the enumeration by volumes a very arbitrary enumeration of the manuscripts, inasmuch as single volumes may contain, some 150 and some 200 articles?—It is arbitrary, but perhaps as little uncertain as any way of reckoning which it is possible to adopt. To number the manuscripts rather than the volumes would be still more arbitrary; for instance, in political dispatches, one man might consider a dispatch, with the enclosures and with the reply, but a single manuscript; another might count each separately.

4449. Mr. *Hawes.*] In answer to question 1263, in last year's evidence, you stated that the officers comprehended under the term of assistants are those who have no custody whatever; it is presumed, however, that the officers mentioned as assistant keepers in the Appendix to the last year's Report, page 370, have custody?—They have.

4450. In the same page of that Report, Mr. Panizzi is mentioned as additional assistant-keeper; has he custody?—Yes; in case Mr. Baber and Mr. Cary were not present, he would have the custody of the books.

4451. In a note appended to Mr. Cary's name, as well as to that of Mr. Panizzi, it appears that he assists in the care and arrangement of the printed books; are they in fact performing the same duties?—Not exactly so.

4452. Will you state the difference?—The Committee had better perhaps obtain any information, with respect to the daily duties of these gentlemen, from Mr. Baber, who will explain the occupations of the officers of this department more satisfactorily than I can do.

4453. Do you know whether they both give securities?—They do.

4454. What is the amount?—I am not sure at the moment whether the amount is exactly the same or not; but my impression is that the amount is the same.

4455. Are they invested with an equal authority and responsibility?—No.

4456. Then why do they give security to the same amount?—Because it might so happen that Mr. Panizzi would be invested with the same degree of responsibility as Mr. Cary, in case both he and Mr. Baber were absent.

4457. In what does Mr. Cary's responsibility consist?—When Mr. Baber is away, he has the sole custody of the printed books, and if both Mr. Baber and Mr. Cary were absent, Mr. Panizzi would have the entire custody.

4458. Have you ever purchased by an agent since you have been keeper of the manuscripts?—Frequently.

4459. Do you see any objection to that upon principle?—By no means; there can be no objection whatever to the mere circumstance of purchasing by an agent; I should always purchase in the way which I conceived most economical,

economical, or in other respects most expedient for the public interests, provided it was perfectly fair and honourable.

4460. You see nothing dishonourable in buying by an agent, and thus preventing the public from knowing who may be the actual purchaser?—Nothing.

4461. May there not be some advantages in it?—Sometimes great advantages; and I have found such.

4462. You have stated that the printed annual lists are to be absorbed into catalogues in due time?—Rather they are to be amplified into catalogues.

4463. Do you mean by that, that the catalogue is to be altogether remade?—Yes, in point of fact.

4464. Therefore those lists cannot be considered as any progression towards a catalogue?—In most cases but an inconsiderable help.

4465. You have heard that portion of Mr. Holmes's evidence relative to the formation of a classed catalogue; what is your opinion of it?—I cannot recollect the evidence sufficiently to answer the question.

4466. Mr. Holmes has stated that, taking certain printed catalogues and dissecting them, he has been enabled to commence a classed catalogue, and that he has actually advanced in the formation of a classed catalogue of the Biblical manuscripts. Now, what is your opinion as to that mode of forming such a classed catalogue with reference to time, to expense, and to utility?—As a temporary and provisional measure it would be useful, but it never could be quite satisfactory; the catalogues must first be correct and complete before a correct and complete classed index or catalogue can be made from them. It will be expedient when we come to correct our catalogues, to cut them up and arrange them in this way, so as to bring the manuscripts relating to the same subject or by the same author together. Mr. Holmes's suggestion is so far a very good plan.

4467. In fact it is the formation of a classed catalogue by a very simple process?—Yes, by a very obvious process, and one easy of execution when confined to certain classes of manuscripts, as Biblical manuscripts, where the contents of a volume are considered as one single work, or classical, where the contents are generally by one author, and in both cases are limited to subjects admitting of an arrangement which is simple, definite and easily understood; or again, historical manuscripts, where the country and date of the transactions described furnish an equally simple principle of distribution. But with respect to the largest portion of a miscellaneous collection, such as the Museum library of manuscripts, the process of classification would be very tedious, difficult and expensive, because many articles embrace a great variety of subjects, many are incomplete and uncertain in their design, many by authors unknown, obscure, or illiterate; and others again by writers in languages with which we are not familiar, and whose modes of thought and expression are totally different from our own; so that for some one or more of these reasons it would often be a work of much difficulty to ascertain the precise subject of an article, and when that point was ascertained, it would by no means be always easy to assign to the article in question its exact place in the arrangement proposed. It is likewise worthy of remark, that the labour of classification would be generally in proportion to the worthlessness of the article. And though the difficulty of a classed catalogue of manuscripts is much greater than a similar catalogue of printed books, yet the observations I have made apply in a certain degree to the last also. Even if the Museum library were much more complete and better stored than it is, and the means at the disposal of the Trustees were ever so ample, I should for my own part be content with such facilities of reference as would be afforded by a good alphabetical catalogue, printed in one series, with a well-digested and full classed index of subjects, and with classed catalogues of the books in some five or six branches of knowledge, which are limited in their extent and definite in their nature; I mean, such as, 1. The physical sciences; 2. The arts of design, and the mechanical arts; 3. British history; 4. British topography; 5. Bibliography; and a few others. But I may perhaps be allowed to take the opportunity of suggesting whether in the annual lists the books added each year might not with advantage be disposed alphabetically in classes, so that a reader might find within the compass of a few pages what new books, in his own particular line of reading or research, had been added to the library in the course of the preceding year.

4468. Mr. Holmes has described the mode in which he has commenced the formation

Rev. *J. Forshall.*

31 May 1836.

formation of a classed catalogue of the Biblical manuscripts; do you think that mode of speaking of it mechanically is one both economical and expeditious?—Yes, so far as that class of manuscripts extends.

4469. In reference to a former answer you have given as to the time that would be occupied in forming a classed catalogue, do you, or do you not think, that this mode of attaining it will alter that period?—No; because I should adopt the very same method myself.

4470. Have you catalogues in a sufficient state of correctness to do it?—No; not to make a satisfactory classed catalogue, or classed index; but to do what Mr. Holmes has commenced.

4471. Are you at this moment revising the old catalogues?—No; but I have always had that revision in view.

4472. Have you, since you were keeper of the manuscripts, attempted a revision of the existing catalogues?—No; not to any extent, except as to the Sloane catalogue.

4473. You have stated that your staff has been considerably increased in the Manuscript department; do you think that consistent with your holding the offices of keeper of the manuscripts and secretary of the Museum?—Yes, I do.

4474. Do you think it desirable that an office like that of keeper of the manuscripts, should be held in conjunction with another laborious office, like that of secretary?—I gave my evidence to the Committee last year upon that point; and I have subsequently seen no reason to alter the opinion I then expressed. The business of the Museum is increasing every year, and every year more rapidly than in the former; and the time must certainly come, and perhaps is not very far distant, when those two offices must be separated; and the moment there is sufficient business to employ the whole time of any person as secretary, it will be much better that they should be separated. But during the past history of the Museum, that would not have been the case; and even seven or eight years ago, when I first succeeded to the office, the secretary had comparatively very little to do in the autumn of the year.

4475. Sir *Robert Inglis.*] Mr. Thomas Thorpe states, in answer 3217, "What is more, Mr. Forshall never saw the manuscripts:" will you explain to the Committee what is the state of the fact?—I saw, so at least, I believe, and so I understood at the time, the whole of the collection as it existed when I first examined it, and as it is described in my report. I went to Mr. Thorpe's, in company with my colleague, Sir Frederick Madden, and we must have spent one or two hours in looking over the deeds. That was, I think, in 1832, and I have seen some part of it since it has been bound; and I am led to think I must have seen it at some third time; because I speak, in my report, of having *again* examined it, though I cannot bring to my recollection having seen it more than twice.

4476. Mr. *Hawes.*] As secretary, of course you take the minutes of the Trustees; who sees that they are executed?—The principal librarian.

4477. Do you communicate to the principal librarian the minutes of the Trustees so soon as they are made?—As soon as they are written out fairly from the rough memoranda.

4478. What time elapses, upon an average, between the making of a minute and the communication of it to the principal librarian?—Between the actual copying it out fairly, no time whatever; the moment it is completed it is sent to him.

4479. What time elapses between the making of a minute by the Trustees and the communication of it to the principal librarian?—It depends upon circumstances. Formerly, two, three, four, or five days; but since this Committee have been sitting, a greater time has elapsed; sometimes 10 days; sometimes perhaps as much as a fortnight: but if there be a minute of any importance, it is communicated to the principal librarian immediately.

4480. So long a time as a month has never elapsed, has it?—Not that I am aware of: if it has, the delay has been caused by some very extraordinary accident, as by illness, or by the absence of Sir H. Ellis during his vacation, or by some cause of that sort. The minutes can never be deferred beyond a month; nor indeed so long as that; because, before the next meeting of the committee, they are entered regularly in the minute-book, and are read to the Trustees at their meeting: but a fair copy is sent to Sir Henry Ellis, upon all occasions, as soon as I can prepare it.

4481. Sir

4481. Sir *Robert Inglis.*] If there be any minute of pressing importance, it is communicated substantially to Sir Henry Ellis as soon as made?—It is, if it concerns the internal management of the Museum.

4482. Mr. *Hawes.*] Would it be advantageous to the Museum to have the office of secretary placed upon another footing; that is to say, to have an individual more of the nature of a clerk, to discharge the duties of the office, and to place the keeper of the manuscripts, as the keeper of every other department, at the head of it, without any other duty to conflict with those of his department?—I think the Trustees will, in all probability, before long adopt some new arrangement regarding the office of secretary; but what that will be I am unable to say; and I do not wish to give a specific answer to the question now put to me, without further consideration.

4483. In your opinion would the formation of a board of the heads of departments be likely to work well or ill for the management of the institution, under the board of Trustees?—I am not sure that such a board might not be useful on certain occasions, and under certain restrictions.

4484. Looking at the description of the duties of principal librarian, as described by Sir Henry Ellis in question and answer 269, do not you think it highly desirable that some alteration should take place in the office of principal librarian, in reference to those details of duty?—I have never given my attention seriously to that subject. I am not aware that any alteration could be made that would be useful. The essential duties of the principal librarian are to take care that every other person in the Museum performs the services required from him; to see that the orders of the Trustees are punctually obeyed; to provide, as far as possible, for the general security and good management of the establishment, and to point out any defects in the Museum, and suggest improvements in it which may be, in his opinion, desirable. But Sir Henry Ellis being my superior officer, I have never looked critically into his duties.

4485. Do you think it advisable to charge the principal librarian with the purchase of articles of a small kind for the use of the establishment?—That is done, I presume, by means of other persons. The principal librarian does not purchase them himself; but merely gives directions.

4486. Sir Henry Ellis says that no articles of a small kind are obtained for any department without his signature?—There must be some signature to authorize such expenditure.

4487. Do you think that a desirable duty to give to the principal librarian?—I do not know to whom it could be better assigned; it seems expedient that it should be assigned to some one person.

4488. Would it not be better to give to a person in the nature of a clerk those small duties?—I think not. To authorize expenditure in a public establishment, even in small things, should be entrusted to a person of more importance than a clerk. To assign the duty to a principal officer is a better security against abuse.

4489. You think it is right that the principal librarian should examine and check the tradesmen's bills?—Sir Henry Ellis does that as expenditor, not as principal librarian.

4490. Do you think it is desirable?—If I am asked whether the office of expenditor should be separated from that of principal librarian, I cannot say why it should; the offices seem to me to be compatible.

4491. The office of principal librarian you think compatible with the examination of the tradesmen's bills, and the purchase of all the small articles for the use of the house?—I conceive it quite compatible with the comptrolling of such bills, and the authorizing of such purchases.

Jovis, 2° die Junii, 1836.

MEMBERS PRESENT.

Mr. T. G. B. Estcourt.	Mr. Compton.
Sir Robert Inglis.	Sir Philip Egerton.
Mr. Hawes.	Lord Stanley.
Mr. Bingham Baring.	

MR. T. G. B. ESTCOURT, IN THE CHAIR.

The Rev. *Henry Hervey Baber*, called in; and Examined.

The Rev. *Henry H. Baber.*

2 June 1836.

4492. Mr. *Hawes.*] WHAT office do you hold in the Museum?—Keeper of the printed books.

4493. Will you state your salary and emoluments?—My salary is 425 *l.* a year. I have an allowance for stationery to the value of about 5 *l.* a year; I am entitled also, under the will of the late Dr. Birch, to a yearly stipend of 5 *l.* 4 *s.* 7 *d.*

4494. Will you describe your duties?—My duties arise from the care and custody of the printed books; also from the means to be taken to render the same available to the public use, as far as is consistent with the regulations of the Museum; also to augment the collections as far as I have funds at my disposal to do so.

4495. To what regulations do you allude?—I allude to the regulations respecting the books sent into the reading-room for the use of the readers. I am to take care that no printed book goes out of the walls of the Museum, unless wanted in a court of law or by the Royal Family, under particular circumstances.

4496. Are there any printed regulations authorized by the Trustees for the regulation of the library?—None beyond what are in the statutes in general, and such as appear upon the minutes of the Trustees, with which the officers are more or less well acquainted.

4497. Do the published statutes or regulations of the Museum comprehend generally the regulations which you refer to in the minutes?—They may contain the substance of them in general.

4498. One of your duties appears to be to augment the library; what steps do you take for that purpose from time to time?—Increase is made to the library from three sources: from donations; by virtue of the Copyright Act, which entitles the Museum to claim one copy of every book printed for sale within the United Kingdom; and by purchase.

4499. With reference to the purchases for the library, do you recommend those purchases to the Trustees?—I used to recommend, and could not make a purchase without an immediate order from the Trustees; there was a committee appointed belonging to the library, to whom I used to submit my lists; that custom has dropped, and latterly I have generally purchased upon my own responsibility, paying due attention in my purchases to the reasonable demands made by the readers, and further to what may be considered most desirable books for a public institution. If the books required be works of very considerable expense, I then think it requisite to submit the purchase to the consideration of the Trustees, for their sanction.

4500. How long has the committee of the library ceased to act in that way?—For some years.

4501. Was there any reason for discontinuing its meetings?—At one period there was very little occasion to apply to them, for the opportunities to purchase, in consideration of the lowness of the funds, were so few that it was very seldom necessary to apply. At one time we had only 200 *l.* a year for the purchase of books; but how it dropped altogether I cannot state now.

4502. Then it is from that cause alone, the want of funds for the purchase of books?—Not entirely; I do not exactly recollect the circumstances under which it ceased.

4503. Who were the members of it?—At the time above alluded to, the late Archbishop of Canterbury, the late Lord Colchester, when he was Speaker of the House of Commons, and the late Mr. Henry Bankes.

4504. Did

4504. Did Mr. Bankes take a very active part?—Yes, more active than any other. The Archbishop and the Speaker generally acceded to my recommendation; but not so Mr. Bankes.

4505. Did the Committee show a desire to listen to your suggestions for the improvement and extension of the library?—In my ordinary applications, as far as they had funds to do so; but they were frequently restricted in their grants; messages being sent, as I understood from report, to bring the expenditure of the trust as low as possible, and this more particularly so when Mr. Hume began to press upon the consideration of Parliament the necessity of a reduction in the public expenditure. But latterly our expenditure has greatly increased, and as much more liberal supplies have been granted, very considerable additions have been made to the collections of the Museum in general.

4506. Then, in point of fact, the committee broke up at the time from the want of Parliamentary and national encouragement to the institution?—It seemed to die away gradually.

4507. Sir *R. Inglis.*] At present you feel no difficulty in purchasing, on your own responsibility, any books which you may feel to be essential or even desirable for the service of the library?—None at all; there is the most liberal indulgence given me that I could wish in the purchase of books, as far as the annual grant (which yearly increases) will admit.

4508. Mr. *Hawes.*] And your suggestions are attended to satisfactorily to yourself on the part of the Trustees?—Latterly very much so.

4509. Sir *R. Inglis.*] When you say latterly, will you explain what is the period which you wish to be understood?—When Mr. Bankes took an active part in the concerns of the Museum, it was extremely difficult to get any assent on his part to any purchase that was of any amount.

4510. Then you refer generally to the last two or three years, during which you have been comparatively at liberty?—Yes, rather longer than that.

4511. Mr. *Hawes.*] What books are under you care?—The whole of the printed books.

4512. Is the Royal library under your care?—Yes, equally with the rest.

4513. Are the librarians of the Royal library under your direction and control?—The same as the rest.

4514. Lord *Stanley.*] Will you explain to the Committee under what circumstances those gentlemen were admitted into the service of the Museum, and under what conditions?—When the Royal library was transferred to the Museum, the librarians attached to that library applied for some emolument in consideration of the income they had lost as librarians to his Majesty. What the communication was that took place between the Trustees and the Treasury, I know not; but a difficulty having arisen about pensioning off those gentlemen, it was suggested that they should not only be continued as librarians of the Royal library, but they should be considered as officers of the Printed Book department in general, and hence they were admitted upon an income the same as the officers in general, according to the rank in which they were placed; Mr. Carlisle was admitted as an under-librarian, a rank equal with my own, upon a salary of 200*l.* per annum; Mr. Armstrong was admitted as assistant-librarian, which is an inferior rank, upon a salary of 120*l.* per annum; Mr. Glover was admitted also as an assistant-librarian, upon the same salary, each being required to devote two days in the week to the service of the Museum for their respective salaries. Upon every additional day given, they were to have the same pay as the other officers, that is, 75*l.* per annum for every additional day in the week throughout the year on which they were employed in the service of the library. The Trustees allowed Mr. Glover to give three days extra services in each week; Mr. Armstrong one day extra service; Mr. Carlisle wished for no extra service, I believe.

4515. In short, the admission of those gentlemen upon the staff of the Museum was a part of the conditions under which the King's library was transferred to the public?—I do not know that it was part of the conditions; it was an act of justice to those gentlemen who had lost their occupation in the King's Library, to transfer them to the Museum, and as a compliment to the King for his most munificent present to the nation.

4516. In consequence of this arrangement and the necessity of making some provision for these gentlemen, there is at present a larger number of gentlemen

The Rev. *Henry H. Baber.*

2 June 1836.

men permanently employed in the Printed Book department, than will be required at any time when vacancies occur?—Yes; it was an act of justice to those gentlemen so to employ them, and it was expedient further to do so in consideration of the great accession of work to be done in consequence of the valuable addition of that splendid library to the Museum.

4517. Sir *Robert Inglis.*] Can you state generally under what circumstances the library in question was formed by the King, and at what rate of expense annually; and what was the general commercial value, if the books could have been sold, that such a library would have obtained in the markets of Europe?—Any information I can give upon the subject is nothing but the mere report of the day; I have no authentic information upon the subject; I can state generally what was my impression and what I heard. With respect to the formation of the library, it was collected upon a plan suggested by Dr. Johnson; that plan appears in the preface of the King's catalogue. It was considered by George the Third that a good library was one of the most valuable additions that he could make to his palace, and no sovereign was better acquainted with books, both as a bibliographer and historian, than his Majesty was reputed to be. It is well known that his late Majesty having determined, soon after his accession to the throne, to form a large and useful library, purchased at Venice, for 10,000*l.*, the extensive collection of books of Mr. Smith, the British consul at Venice, and that he applied, through the period of 60 years, 2,000*l.* annually towards the purchase of books, this together being an expenditure upon this library of 130,000*l.* With respect to the value of the books, it is impossible to say what that may be at the present day. When books were fetching a much higher price than they now do, the value of this library was estimated at 200,000*l.*; but what may be the value at this day, when books are very much fallen in price, I cannot say; but with respect to its literary value and importance, it was the most valuable addition that could possibly be made to the Museum. No selection that any librarian could have made, could have been more wise and judicious for the public than that of his late Majesty's library. It came to the Museum through the exertions of the Trustees; some struggle was made to separate it from the Museum. There were various projects with respect to the manner in which it should be disposed of, and last of all, by a great deal of exertion, it was attached, and I think wisely, to the Museum.

4518. Mr. *Hawes.*] Do you know anything of the exertions made by the Trustees upon that occasion?—Sir Henry Ellis, who was then secretary to the Museum, can give the best information upon this point.

4519. You say the King's Library was formed upon a plan drawn up by Dr. Johnson; will you describe it?—It is given in the letter above-mentioned, forming a part of the preface to the printed catalogue of the King's library, in five volumes folio. The great object, as appears from the contents of the library, was to assemble every important work relating to ecclesiastical, civil and literary history, for the prominent feature of the library is historical literature, yet other branches of knowledge were far from being neglected. There is to be found also in this library a well selected collection of books relating to theology, law, science and belles lettres.

4520. Was not there a catalogue accompanying it?—A printed catalogue of five volumes folio.

4521. Was that an alphabetical catalogue?—It was; there was also a classed catalogue which accompanied it.

4522. Was there any index?—No.

4523. Has any classed catalogue been commenced with reference to that library?—There is a classed catalogue in manuscript belonging to that library, but no classed index.

4524. Do you know who drew up the classed catalogue?—Sir Frederick Barnard.

4525. Will you state your opinion of it?—It is not done with that care and accuracy with which perhaps Sir Frederick Barnard would have made it, if he had intended it for public view. The classes are not very clear and distinct, and in many instances there are books put in one class that would be more appropriate in another.

4526. What is your opinion generally of a classed catalogue of a national library?—A classed catalogue is frequently desired and is useful.

4527. One

4527. One has been commenced in the Museum?—And has proceeded to a considerable extent.

4528. Could it not have been continued in conjunction with the alphabetical catalogue?—It might.

4529. A considerable sum was expended upon it?—There was.

4530. Can you state why it was not continued, without any reference to the individuals employed upon it?—I cannot exactly state the reasons that the Trustees had for discontinuing it; I myself, when asked for my opinion upon the subject, certainly stated strongly, that I considered an alphabetical catalogue the most useful; not that I wished the catalogue of a public library to be limited to an alphabetical catalogue, but finding it to be the most useful for general purposes, I wished to see a good alphabetical catalogue made in the first instance. Then the next thing would be to have added to it a good copious index, and after that, if such a catalogue with its full index did not satisfy the public wants, then let a classed catalogue be made.

4531. Was it discontinued against your judgment?—No, I do not apprehend that it was.

4532. Will you state when it was discontinued?—In 1830 it was partially stopped, Mr. Horne being the only person employed upon it. It was further suspended in 1834, Mr. Horne's services being transferred towards assisting in the preparing a new alphabetical catalogue of the entire contents of the library.

4533. Do you think that at any time a classed catalogue could be so economically and expeditiously formed as at the time when you are forming an alphabetical catalogue?—It is the best time to form it, making the alphabetical catalogue complete first.

4534. Then why do you state that it was in concurrence with your judgment that the formation of a classed catalogue was suspended?—The Trustees seemed disposed to have but one catalogue going on at one time.

4535. The question is asked of you as the head of the Printed Book department, in reference both to the economy and the expedition of forming a classed catalogue conjointly with an alphabetical catalogue?—The question was not pressed upon me by the Trustees, and I did not suppose that they were disposed to go to the extra expense that would necessarily be caused by letting the two proceed simultaneously.

4536. Then it was suspended without consultation and communication with you?—Certainly not without communication with me, for I was called into the committee-room of the Trustees, and asked whether it could be suspended and taken up again at any future period; I told them the method by which that could be done, and it is only partly broken up now, and only so broken up that the titles could be assembled again immediately.

4537. Lord *Stanley.*] You mean to state that although the completion of the classed catalogue is postponed, still the labour which has been employed has not been thrown away, but remains?—Certainly not; there is only the labour of reassembling it, which anybody who can read their alphabet and the Arabic numerals can do.

4538. And that has been suspended for the purpose of turning the strength of the establishment to an object which may be of more immediate benefit to the public and to the readers?—I think if one catalogue only were to be made at once, an alphabetical catalogue was the most important. After a long experience, first in the Bodleian for three years and for 30 years in the Museum, I hesitate not to say that if no alphabetical catalogue existed, and you had only a classed catalogue, the library would be of very little use compared with what it would be if it had only an alphabetical catalogue; but if you can have all sorts of catalogues, I should be glad to see it.

4539. Mr. *Hawes.*] You think the library would be comparatively useless if only a classed catalogue existed?—I do.

4540. Will you state how an author who should desire to know the works written upon a particular subject, would proceed to find them in the library of the Museum, in the absence of a classed catalogue?—The persons who come to consult books at the Museum generally come for the purpose of research; they know what they want, and those that want more than that go to other sources of information. One way among many in which they will proceed, they will consult the references cited by the author they are reading, be the subject of

The Rev. *Henry H. Baber.*

2 June 1836.

their study what it may; thus the writings of many authors whose works may be subservient to their purpose will be brought before them.

4541. But supposing he wishes to know what works have been written upon a particular subject, without knowing the authors' names of them, a case that may occur to a literary man; how is he to proceed in the absence of a classed catalogue?—He can apply to the librarian, taking care candidly to state what his objects are; and if the information desired be within the compass of a librarian's title-page knowledge, he will generally get very large assistance hereby.

4542. Is he sure to know from the librarian all the books in the British Museum upon that subject?—Very few men are so happy as to have such a memory, but that librarian can frequently point out many sources which a classed catalogue will not supply, from which the desired information may be directly or indirectly obtained, not only from such books as may happen to be in the Museum, but further in other libraries.

4543. Therefore the knowledge of what writers have written upon a particular subject cannot be had at the present moment, so far as the British Museum library is concerned?—Not by any catalogue which relates only to the contents of the Museum library.

4544. Could he not obtain that information if a classed catalogue existed?—A classed catalogue would give him a very large portion of the information.

4545. Lord *Stanley.*] In order to obtain the information which is supposed to be desirable, would it not be necessary, not only to have a classed catalogue of the library of the British Museum, but a catalogue of all works that have been written in all times, and in all places, upon the subject?—Yes, if the student wished to ascertain what books had been written in general upon any particular subject.

4546. Mr. *Hawes.*] Are there many classed catalogues of libraries of private institutions?—There are.

4547. Have not many of those catalogues alphabetical indexes?—They have.

4548. Do not they therefore unite in themselves all that is required, both in an alphabetical and a classed catalogue?—To a person that wanted to look for any particular book, there is considerable trouble. He goes to the index, and then to the class in which that book is; and, generally speaking, the person would come better at his information by having an alphabetical catalogue than by having a classed catalogue.

4549. But is it not the case that one important class of inquirers at the Museum would find what they want in a classed catalogue, and would not obtain what they want in an alphabetical catalogue?—They would find it, so far as the contents of the Museum go.

4550. Then is not it a fair inference, that an alphabetical catalogue is of inferior importance to a classed catalogue?—No; because in general persons apply to an alphabetical catalogue, and not to a classed catalogue: if you had a classed catalogue, with an alphabetical index of authors, the index would be turned over by more persons than the catalogue would.

4551. That is to say, those persons only who know the names of the authors upon the subject which they are studying?—Yes; and those are the largest portion.

4552. But the other class would not find the information?—No; the smaller class would not.

4553. But both classes would find the information in a classed catalogue with an alphabetical index?—Yes; but the larger class at the expense of the smaller.

4554. Then is not a classed catalogue of more importance than an alphabetical catalogue?—If there is to be only one, I would rather have the alphabetical alone: I should like to see both.

4555. Lord *Stanley.*] Suppose an alphabetical catalogue is to be made, and a classed catalogue is also to be made, do you conceive that much time would be saved by carrying on the two operations of the alphabetical catalogue and the classed catalogue together, in comparison to what would be taken up by first finishing that, and then from that making the other?—The persons that would be employed to make the alphabetical catalogue, and to make the classed catalogue, would be of a very different description; you would want a man that was a common decent scholar for the alphabetical catalogue; you would

would want men conversant with particular sciences for particular portions of the classed catalogue. The persons that you would get to make the alphabetical catalogue would be men of less knowledge and skill than the persons that would be required to make a classed catalogue; therefore I do not conceive that by the same persons the work could proceed simultaneously, unless you were to employ persons that were skilled to class as well as to catalogue.

4556. You must have, in the preparation of either the one or the other, certain persons of considerable literary ability, and certain persons under them, to perform the mere mechanical part. Now, supposing your staff to be such as you would require for both purposes, do you think that much time would be saved by carrying on the two operations simultaneously, as compared with carrying them on one after the other?—If the two descriptions of persons mentioned were employed, the one to transcribe the title of a book, the other to class it immediately upon its being transcribed, it would frequently happen, from the ambiguity of very many titles, that the person classing a book would not be satisfied with merely reading the title, but would have frequent occasion to inspect, and that very minutely, the contents of the book, before he would venture to fix it in its most appropriate class. Hence the time to be saved by both processes, that of transcribing a title, and that of classing it, would be the time saved in having a book already looked out by an attendant for the former purpose ready at hand for the latter.

4557. Mr. *Hawes.*] How many persons have you working now to make an alphabetical catalogue?—Four.

4558. How many more would be requisite, supposing a classed catalogue was constructing at the same time?—That would depend upon the rate at which you wanted it to go on.

4559. Could you, with your present numbers, carry on the formation of a classed catalogue and an alphabetical catalogue at an equal rate?—Certainly not.

4560. What would be the increase of assistants that you would require now to carry on a classed catalogue at the same time with the alphabetical catalogue, *pari passu*?—I do not know that I could give a proper answer to that question: it would be requisite that a trial should be first made.

4561. Would it be a material increase?—A very considerable increase. You must get men of different sciences: for the jurisprudence you must get a jurist; and so, in many instances, persons well qualified to class books in certains portions of science. Unless you adopt this method in classing an extensive library, embracing every ramification of human knowledge, your classed catalogue would be in danger of being crowded with frequent instances of erroneous classification, and still further with very many ridiculous examples of most ludicrous mistakes.

4562. Lord *Stanley.*] Does not your answer, with regard to the different descriptions of persons that would be employed in the two operations, negative almost the possibility of carrying on the operations simultaneously, and render it necessary to complete one fully by one description of persons, and then to carry on the other by another description of persons?—No; by a proper adjustment of the number of persons employed to transcribe and to class the titles, which could only be ascertained by experience, both operations might proceed at nearly an equal rate.

4563. Supposing the classed catalogue and the alphabetical catalogue to be carried on together, would not the carrying on of those two simultaneously, provided the strength were not materially increased, very much postpone the time at which the public could be in possession of the alphabetical catalogue?—Yes.

4564. Do not you think it is desirable that the public should be, as soon as possible, in possession of the alphabetical catalogue?—I think it most desirable.

4565. Then unless you had a very large increase of strength, and consequently a much increased expenditure, you could not, without delaying that which you conceive essential to the public, carry on a classed catalogue at the same time with the alphabetical catalogue?—Certainly not; the strength of the house at present could not do it.

4566. Mr. *Hawes.*] Has the alphabetical catalogue proceeded at a much more rapid rate since you suspended proceeding with the classed catalogue?—The alphabetical catalogue has occupied entirely the attention of the gentlemen that have been set upon it. I think the rate at which the alphabetical

The Rev. *Henry H. Baber.*

2 June 1836.

catalogue and the classed catalogue would proceed, are nearly the same; it would take nearly the same time to make the classed catalogue as to make the alphabetical.

4567. Would it require double the staff to do it?—It would not require double the staff to do it.

4568. Would there be none of the mechanical part of the labour saved by carrying on both together?—There would be an economy of time; because the books that were looked out for the alphabetical catalogue would be at hand for the person that classed them to examine, if necessary.

4569. Would it not save time, and therefore save expense?—Yes.

4570. You stated, that to make a good classed catalogue, it would be necessary to have a jurist to classify the legal works, and a geologist to classify the works on geology; are you acquainted with the various classed catalogues that have been published by public institutions, both at home and abroad?—The classed catalogues that have been formed abroad of any very extensive library are not numerous, and how they were formed I know not.

4571. Lord *Stanley.*] At the present moment the principal strength of your department in the Museum is engaged neither in the classed catalogue nor in the alphabetical catalogue, but in hastening the completion of transcripts for the use of the readers?—We are transcribing two catalogues; one for the use of the library, preparatory to the removal to the new building; and the other for the use of the readers; for the catalogue for the use of the readers is so crowded, and so worn, that it is necessary to transcribe it.

4572. What number of folio volumes will the new catalogue for the use of the reading-room consist of?—It will extend to nearly 50 volumes, interleaved; it is the octavo printed catalogue, inlaid in folio, and interleaved.

4573. What progress has been made in it within the last six months; are there any of those volumes ready for being deposited in the reading-room?—It is proceeding, and has proceeded as far as the letter G; but no volumes are complete, as there are certain articles that want revision and improved arrange ment.

4574. How soon do you suppose that those complete transcripts will be laid in the reading-room for the benefit of the readers?—I hope to have a few volumes ready in two or three months.

4575. How soon do you suppose the whole will be completed with the strength that you have upon it?—By the end of this year I hope it will be done; but I have two officers away at present; one from illness, and another from another cause, by permission of the Trustees.

4576. That has been an object which has been very much desired by the public, has it not?—I have thought it very desirable, as the interleaved catalogue in the reading-room was becoming very inconvenient to consult, on account of the crowded and confused state of some of its pages.

4577. Are you not aware that considerable complaints have been made in the reading-room of the state in which the catalogue was?—In some instances complaints have been made; and I found that they would be increasing, if something was not done immediately; I pressed it, therefore, on the notice of the Trustees.

4578. Mr. *Hawes.*] And it was attended to, and taken up by them?—Not in the first instance, but it was subsequently; it is now going on vigorously.

4579. Perfectly to your satisfaction, and likely to remove any complaint?—To my satisfaction, so far as it is only intended for temporary use, till an alphabetical catalogue, which is intended to embrace the contents of the King's catalogue and every other catalogue connected with the Printed Book department can be completed.

4580. You are acquainted with the printed Parliamentary paper called "Regulations of the British Museum," published in the year 1807?—I do not recollect it.

4581. In the report which is alluded to in that paper, which is a report proceeding from the Trustees of the Museum, the following works are specified as fit to be executed either in discharge of the ordinary duties of the house, or as extra services, and under the head of Printed Books the following are recommended: a revision and enlargement of the synthetical arrangement of the library; an alphabetical catalogue of the whole library, consolidated into one series, and a general classed catalogue, according to the principle of arrange-

ment

ment detailed in the report made on the 12th of July 1806?—I am aware of that.

4582. Have any steps been taken to fulfil the recommendations of that Committee?—A classed catalogue was commenced in consequence of those recommendations.

4583. Was that commenced in 1806?—No, it was not commenced till 1824, but why, I cannot say at present.

4584. And that is now suspended?—That is for the present suspended.

4585. So that that recommendation for 30 years has lain dormant practically?—It has been in force for a certain time.

4586. But it has in point of fact been dormant for that period?—It has been acted upon only partially. A classed catalogue was commenced in 1824, and was afterwards in some degree stopped in 1830.

4587. Is any portion of the classed catalogue in existence?—Yes; in manuscript there are about 160,000 titles classed, and only about 20,000 broken up. The portion which has been broken up can be reassembled very soon.

4588. Lord *Stanley*.] You said just now, that the Trustees had not in the first instance attended to your recommendation with regard to the transcribed catalogue for the readers; when did you make the first recommendation?—I forget when it was; a discussion took place at the board of the Trustees at which I was present; Sir Robert Peel was present, and he suggested a plan, by which it might be done, as he thought, with great expedition, but the project dropped. I know not why, I pressed it again upon the consideration of the Trustees at the end of last year, and it was adopted. I never had any reasons given to me why it was not upon my first recommendation proceeded with.

4589. Mr. *Hawes*.] When was it readopted?—Late in last year.

4590. Then in the resolutions which the Trustees come to with regard to the management of the library, do not they previously consult you?—Sometimes I am sent for into the room.

4591. Is there that general consultation and cordial intercourse which is satisfactory to you as head of your department?—Certainly not.

4592. If there are 160,000 titles classed, is not that a large proportion of the whole 220,000 volumes in the Museum?—Volumes and articles are two different things.

4593. What proportion do you think those would form of the whole?—It is estimated that we have 240,000 volumes in the library; 218,957 are estimated in the return in 1833. In that return, a considerable number of pamphlets were by accident omitted to be reckoned, which would otherwise have materially enlarged the statement of the number of volumes there returned. Since that return, many thousand printed works have been added by purchase, and by the operation of the Copyright Act; therefore there are 240,000 volumes estimated to be in the library at present. These volumes are estimated to yield above 300,000 titles or entries in an alphabetical catalogue. As an example of the difference which would be made by counting a library by volumes or by articles, take the instance of the Mercure de France, in which you have a work extending to 500 volumes, yielding only one title or entry; in another case, in that of a volume of tracts, you will have a single volume, comprising near 300 articles or separate publications, yielding so many titles, but counting only as one volume.

4594. Then it appears that you have proceeded with the classed catalogue more than half-way?—About half-way.

4595. How did it happen that a parcel of books was overlooked in making the return to Parliament in 1833?—I do not know; they were a mass of pamphlets that were omitted.

4596. Will you describe the circumstances under which the omission of those pamphlets took place?—The man forgot to take account of that part of the room in which those books were deposited; they were bundles of uncatalogued pamphlets that were thrown on one side till they could be catalogued.

4597. Lord *Stanley*.] With respect to the discrepancy between the number you have now stated of 240,000, and the number stated in the return of 1833, of 219,000, in how great a degree do you suppose that discrepancy is accounted for by the annual purchases of books that have been made since that

The Rev. *Henry H. Baber.*

2 June 1836.

return was made?—About 14,000 or 15,000 publications of greater or less extent, have since that return was made, been added to the library, either by purchases, or by the Copyright Act, or by donations.

4598. Mr. *Hawes.*] The return in question was to March the 25th, 1833; now from March the 5th, 1833, to the same date in the year 1836, has there been anything like the number of an annual average of 4,000 added to the library?—Yes; I should think there were more: all this is estimate; they have not been counted; but to the best of my belief and knowledge, I think my statement to be correct.

4599. Is there no account kept of the books that come in, so as to know accurately the annual additions?—Of the titles there are; you can have how many titles, but not how many volumes.

4600. Is there any journal kept of the books received at the library and placed under your care?—No; I have no daily journal of the entries and accessions to the Museum.

4601. Is there any book in which the works are entered as they are received, so that at the end of the year, from that book, you can state the number of volumes added to the library in any one year?—The printed list will show the additions made; but then, very generally, a collection of pamphlets may be represented to be 120 or 130 volumes, and when they come to be catalogued they will yield 4,000 or 5,000 articles.

4602. Will the additional list show all the books received, whether under the Copyright Act, or by donation, or by purchase?—Yes; but such publications as have been purchased and are included in more volumes of tracts than one, such a collection of pamphlets would be recorded in the annual printed list merely as a collection of pamphlets in so many volumes, without specifying, for want of time to catalogue them, the separate publications therein contained.

4603. Then there is, in point of fact, an entry made of all the books received, from whence you can give an accurate account of the augmentation of the library?—We can make it from the Stationers' Hall and collectors' lists, and from the transcribed titles of the purchased books, and the books presented; but there is no book in which there is an entry of that kind made except the list which is published annually, giving an account of the additions made in the course of the year.

4604. That is a book giving the titles, not the volumes?—It gives the volumes and not the titles, in many instances, for reasons stated in a previous answer.

4605. Suppose Gibbon's History of Rome had been received in the course of the year, would it not be entered under the title of Gibbon's History of Rome, and would there therefore be anything to show how many volumes it consisted of?—Yes; in a clear case like that every separate book is specified, but if it is a collection of pamphlets, the separate tracts in the collection are not specified, but the number of volumes is mentioned.

4606. You have stated that, to form a classed catalogue, you must have first-rate men in the various departments of knowledge; do you adhere to that opinion?—I do; for I am sure you would commit many gross mistakes if that were not done.

4607. Do not you think it might be made so correct as to be a work of great public utility without the assistance of such a class of gentlemen?—It would be useful, but it would be safer and far more creditable to a great national library to do it with the best and ablest assistance.

4608. Assuming that to do it with perfect accuracy that might be necessary, yet might it not be done so as to make it a work of great public utility without that?—Yes, it might; but I should like to see anything that went out of the Museum go forth as perfect as it could be made.

4609. Are you acquainted with the classed catalogue of Queen's College, Cambridge?—Yes.

4610. Is that sufficiently accurate to be a work of utility?—I have never been led so accurately to look to it as to pick out its faults; I have found it generally useful.

4611. Are you acquainted with the classed catalogue at Sion College?—That was printed a very considerable time ago.

4612. Are not there classed catalogues of various private institutions; has not the library of the Inner Temple a classed catalogue?—And a most wretched production

duction it is. Demosthenes is placed amongst modern Latin authors, and Isæus and Cicero amongst English prose writers. It is true that the Demosthenes is a Latin translation of the original, and the two latter English versions of their respective originals. No good bibliographer, however, would place them as they are in this catalogue.

4613. Is there not a classed catalogue forming of the library of the Royal Society?—Yes.

4614. Is not that formed by a very competent person?—It would have been a good one if it had been left to his own discretion, but by the interference of gentlemen who are men of science, they have made a complete jumble of it, against the strongest remonstrances of Mr. Panizzi. It will be a most incongruous catalogue, and it will be very far from giving satisfaction to Mr. Panizzi.

4615. That Mr. Panizzi is perfectly competent to form a classed catalogue may be inferred from the answer you have given?—I think it is a bold thing to undertake a classed catalogue of a large library to any extent. Mr. Panizzi gets the best assistance he can; he is as competent as any body, but I consider no individual competent to such a work without committing errors; and the expense, upon the whole, would not be more in employing several competent men than it would be in employing one man. If it would take one man 20 years, 20 men would do it in one year, and it would be much better done.

4616. Will you apply that to the library at the British Museum, and state why it should not be adopted there?—It has been adopted as far as the classed catalogue has gone. There is one person to take the mathematical and another person to take the theology, and another jurisprudence.

4617. In your opinion such a classification ought to go on and be completed?—It is desirable, but I think it is more desirable that there should be an alphabetical catalogue, and that alphabetical catalogue should have a very full index of matters, &c. to it; at the same time, if the whole could go on together, it would furnish the library, as far as catalogues are considered, with every thing of this kind which the public could in reason desire.

4618. It would render the library more accessible to the public, and it would save a great deal of trouble to the librarians?—It would.

4619. Lord *Stanley.*] Can you calculate what the additional expense will be of carrying on the two operations simultaneously, so as to execute them within a reasonable time?—No, I cannot.

4620. Mr. *Hawes.*] Do you know anything of the classed catalogue of the Gottingen library?—I have heard of it; I have not been at Gottingen.

4621. Have you heard whether they are forming one at Vienna?—I have heard of it.

4622. And also of the library at Leyden?—Yes, there is one at Leyden and one at Munich.

4623. If all those great public libraries are forming classed catalogues and other private institutions have classed catalogues, do not you think it is a work worthy of national encouragement here, and that it ought to be completed for the use of the British Museum?—I have never objected to a classed catalogue as a classed catalogue.

4624. You spoke of the classed catalogue at Sion College being an old catalogue; have you seen it recently?—No.

4625. You are not aware that it is kept up to the last accessions to the library?—I cannot say; they have no strength there for such a purpose; and I even doubt whether a large portion of the books are catalogued at all.

4626. The readers in the Museum make great use of Watts's Bibliotheca, do not they?—It is consulted.

4627. Is it not tolerably well thumbed, and bearing marks of service?—It is used a good deal.

4628. Do you superintend the reception of works under the Copyright Act?—I do.

4629. Will you state what means you adopt to secure the reception of all the works which by law you have a right to?—We have a person appointed specially to watch the progress of publications, by going over the advertisements wherever he can trace them, and making memoranda of publications when they are advertised as being in the press or published; and what are not entered at Stationers' Hall, it is his duty to apply to the different booksellers,

The Rev. *Henry H. Baber.*

2 June 1836.

and demand, in the name of the Trustees, the publications they have omitted to enter at Stationers' Hall.

4630. Are they all regularly received?—No, we lose, I conjecture, about one-fifth of the publications; there is every dirty trick resorted to to impose upon us, and to evade the Act.

4631. Are the Trustees, in consequence, reduced to the necessity of buying many works that they really have a legal right to?—They generally get the most important; they do not buy a great many.

4632. Lord *Stanley.*] With regard to works of inferior value, which is the cheapest course, buying them or going to law to ascertain the legal right?—They would only go to law to ascertain the legal right, to deter other booksellers from refusing to enter or deliver their books.

4633. Did not the Trustees go to law about the Flora Græca?—I am sorry to say they did.

4634. Did they succeed?—No, they did not: and it cost them a considerable sum of money. It was a case that they ought not to have taken in hand.

4635. Mr. *Hawes.*] Why do you entertain that opinion?—The Attorney and Solicitor-general gave an opinion that the book was claimable; but the Trustees were, at the same time, recommended not to prosecute, as it was thought that it would not be popular to do so, as it might interfere with the progress of the work, as it was publishing at very considerable expense. Lord Spencer persisted in urging the prosecution of the work, and the Trustees lost their cause.

4636. Who is the collector under the Copyright Act?—A person of the name of Cowtan.

4637. Does he hold any other office?—He keeps the accounts of the Museum.

4638. Has he any other occupation besides accountant and collector of books under the Copyright Act?—Not that I am aware of.

4639. Lord *Stanley.*] Is he paid by salary or by a per-centage?—Salary.

4640. Was not the question raised and discussed, whether it was expedient to pay by salary or per-centage in that case?—I believe it was; but it was judged better to pay him by salary.

4641. Mr. *Hawes.*] You think no books are purchased that could be obtained under the Copyright Act?—Not recent books; if they are lapsed books, that is, works which the publishers have neither entered at Stationers' Hall, nor delivered to the Museum within the first year of their publication, they have thus become unclaimable, and such works are occasionally purchased for the use of those who frequent the reading-room.

4642. If they are pressed for much in the reading-room, you purchase them without waiting to obtain them under the Copyright Act?—Not till I have tried and found that the time has gone by for claiming them by law, and that the recovery is hopeless; then I do not hesitate to purchase them if they are books very much wanted.

4643. Mr. *Baring.*] Is the wear and tear of books considerable?—It is increasing, in consequence of the increase of readers; we have been obliged to ask for 100 *l.* per annum more for binding, which has been given.

4644. *Chairman.*] Under the Copyright Act do you make an application for the book, or does the publisher send it to you?—Under the Copyright Act the publisher is bound either to enter it at Stationers' Hall, or to send it to the British Museum, and if he does not do either, he is subject to a penalty of 5 *l.* and eleven times the price of the publication, together with the costs of the prosecution. Booksellers do enter to a certain extent at Stationers' Hall, and what are not entered at Stationers' Hall, Mr. Cowtan applies for personally or by writing to the respective publishers. I can show a statement of what we obtain through the Hall, and what we have obtained through the collector's exertions, both with respect to the number and money value. The average number for the year is, 3,106 works, of books and pamphlets; the amount in value is, 1,209 *l.* 17 *s.* 9 *d.*, that is the total; but with respect to the number of articles that are entered at Stationers' Hall, taking the year 1835, there were 931 articles entered at the Hall, and 2,263 which they would have cheated us of, if we had not had a collector to obtain them. The money value of the books entered was, 317 *l.* 16 *s.* 8 *d.* The money value of the books collected was,

was, 454 *l.* 8 *s.* 7 *d.*; that did not include music, of which there were 188 articles, value 41 *l.* 16 *s.*, that is for the year 1835–6.

4645. Lord *Stanley.*] What is Mr. Cowtan's salary as collector and accountant?—£. 130. a year; I will deliver in these returns to which I have alluded.

[*The Witness delivered in the same, which are as follows:*]

	Number of Books and Pamphlets entered at Stationers' Hall, and received for the Library of the British Museum; with the Money Value thereof, taken at the Published Prices.			Number of Books and Pamphlets procured by the Collector, for the Library of the British Museum; with the Money Value thereof, taken at the Published Prices.*			Number of Songs and Pieces of Music entered at Stationers' Hall, and received for the Library of the British Museum; with the Money Value thereof, taken at the Published Prices.

* To this Statement is added the presumed number of volumes created by the several periodical works, (amounting to about 200), producing on an average two volumes each per year, say 34 volumes per month.

Memorandum.—So small a portion of the books published being entered at Stationers' Hall, and from the difficulty there is in ascertaining what books are published in the provincial cities and towns of the United Kingdom, the collector for the British Museum calculates that at the least one-sixth part of the works published do not reach the library of that institution.

4646. Mr. *Hawes.*] With reference to public papers of importance, for instance the London Gazette, what arrangements are made for the purpose of securing an accurate and an early supply of those publications?—The Gazette, as also the newspapers, we receive now through the Stamp-office, and the supply is made annually, but it is always two years in arrear. They are left at the Stamp-office as evidence papers, and are detained there in case they should be wanted in any court of law. As soon as the two years expire there is no demand for them, and they are given up to the Museum. Formerly they used to be sold as waste paper. Hearing of that, I made some exertions to get them at the Museum, and they are a very valuable addition to our stores, and we have now a collection amounting to above 2,000 volumes.

4647. From what date?—Commencing with the earliest date of a *news-letter*

The Rev. *Henry H. Baber.*

2 June 1836.

in 1588, and proceeding in their respective series, more or less complete, up to the year 1833. In the year 1817 I obtained the London papers first, and a few years ago the country papers.

4648. What London and country papers do you preserve?—All the London and country papers that are published: they are very much in request, and it has increased our number of readers very much.

4649. Do you take English, Irish and Scotch?—English only; we cannot get the Irish and Scotch; we should be glad to get them if we could.

4650. Is it advisable to go on preserving all the country papers?—We find it advisable, because they are very much in request, so much so that they add very much to our labour in supplying the readers with them.

4651. Will you describe the class of readers that consult them?—All classes.

4652. What object have they?—Tracing property through advertisements, of property offered for sale; tracing births, marriages, and deaths. Attornies and persons of all descriptions, men and women of the humblest rank in society, frequently consult them for those purposes. They are referred to also for various literary purposes.

4653. Do you think there is a sufficient reason for these papers being two years in arrear at the Stamp-office before they are sent to the Museum?—The Stamp-office are the best judges of that.

4654. The Acts of Parliament are regularly delivered and preserved in the Museum?—They are sent by order of Parliament.

4655. And all the Sessional papers?—Yes.

4656. Are they sent to the Museum as soon as published?—No; they never come to a considerable time after the Session is closed.

4657. Have you received the Minutes of Evidence taken before the Committee on the British Museum last year?—I do not think we have. The delay in the delivery is more to our advantage than disadvantage. They come to us in a very valuable state; the papers are arranged for us and paged, with table of contents added, and bound in volumes, as they are for the use of the Government offices, and all this at no expense to the Museum. We pay for the binding of the Lords' papers; but in consequence of the Commons' Parliamentary papers being all sent in bound, we cannot receive them till the whole series is completed.

4658. Then, with regard to the supply of public documents, are you satisfied?—They are very ample. I believe that we get every thing that belongs to the Government, as far as I am aware, at least all Parliamentary papers.

4659. With regard to foreign literature are there any steps taken to secure a regular supply of the principal works published abroad?—Yes, we purchase, as far as our means go, foreign books.

4660. What means do you take to ascertain foreign books?—Reading over all the catalogues that come in my way.

4661. That depends upon yourself?—I make a selection, and if any officer or reader furnishes me with any articles that are desirable, I take them into consideration and purchase them accordingto my means.

4662. Are the leading German authors' works in the Museum?—The readers of German literature are not very numerous.

4663. Is that a reason for not having the leading authors of Germany?—The first object is to purchase those works that are most wanted.

4664. Then you do not select the works of the most eminent and most distinguished authors, but those which are most wanted?—In some instances I do, if the funds admit of it; but I do not make it a rule generally to do so, and that principally from want of funds.

4665. Have you a complete set of Göethe's works, for instance?—We have got a portion of his works.

4666. It is stated in a pamphlet, which has been recently published by Mr. Edwards, that there are none of Göethe's works later than 1819, except the correspondence with Zelter; is that so or not?—None, except some few translations of some of his works.

4667. Have you the works of Herder, or of Wieland or complete sets of the works of the principal German authors?—We have Herder's works, in 44 volumes, purchased July 1835, when I purchased also the works of Lessing, Gellert, Gleim, Schiller, and Körner. We have the collected works also of other German authors, purchased September 1835, viz. Burger, Howauld, Mendelsohn,

Seume,

The Rev. *Henry H. Baber.*

2 June 1836.

Seume, and Tieck. These were not entered into the reading-room catalogue, nor are books in general entered there as soon as they come into the Museum, because we have arrears of entries to fetch up. But if they had been asked for they were forthcoming, for public use. With respect to Wieland's works, Mr. Edwards referred not to the King's catalogue, which is in the reading-room, where he would have found the following list of Wieland's works:

Wieland, Christoph Martin, Herz. Sachs. Wiemarscher Hofrath, &c.

97. h. 1.—Sämmtliche Werke; mit kupfern, 42 vol. 4to. G. P. Leipzig, 1794, &c.
95. d. 1.—Prosaischer Schriften; 2 vol. 8vo. Zurich, 1771-72.
88. a. 3.—Poetische Schriften; dritte auflage, 3 vol. 8vo. Zurich, 1770.
243. b. 27.—Comische Erzählungen in versen; zweyte auflage, 8vo. (Zurich), 1768.
224. d. 12.—Empfindungen des Christen; neue auflage, 8vo. Zurich, 1769.
232. b. 31.—Beyträge zur geheimen Geschichte des menschlichen Verstandes und Herzens, 2 vol. 8vo. Leipzig, 1770.
231. e. 39.—Sympathien; zweyte auflage, 8vo. Zurich, 1758.
88. c. 23.—Der Gepryfte Abraham; ein Gedicht. 4to. Zyrich, 1753.
242. k. 27.—Musarion, oder die Philosophie der Grazien; ein Gedicht, 8vo. Leipzig, 1769.
85. e. 13.—Le même; (traduit en prose Francoise, par M. Laveaux), 8vo. de l'Imprimerie de la Société Littéraire Typographique, avec les Caractères de Baskerville, (Kell), 1784.
88. a. 17.—Idris, ein heroisch Komisches Gedicht. 8vo. Leipzig, 1768.
244. f. 31.—Die Grazien; mit kupfern, 8vo. Leipzig, 1770.
243. b. 29.—Combabus; ein Erzählung, 8vo. Leipzig, 1770.
88. a. 15.—Der neue Amadis; ein Comisches Gedicht; mit kupfern, 8vo. vol. 1, Leipzig, 1771.
243. l. 35.—Cyrus, in V. Gesangen, 8vo. Zurich, 1759.
244. d. 11.—Der Goldne Spiegel, oder die Könige von Scheschian, eine wahre Geschichte; mit kupfern, 4 vol. 8vo. Leipzig, 1772.
243. k. 9.—The History of Agathon, translated from the German, 4 vol. 12mo. London, 1773.
244. e. 1.—Araspes and Panthea, eine Moralische Geschichte, 8vo. Zurich, 1760.
245. f. 24.—Die Abentheuer des Don Sylvio von Rosalvo; mit kupfern, 8vo. vol. 1. G. P. Leipzig, 1772.
248. c. 35.—Geschichte des Frauleins von Sternheim, 8vo. vol. 1, Leipzig, 1771.
244. l. 13.—Die lezten Gespräche Socrates und seiner Freunde, 8vo. Zurich, 1760.
244. l. 28.—Die Dialogen des Diogenes von Sinope; mit kupfern, 8vo. Leipzig, 1770.
244. l. 25.—The same; translated from the German, by Wintersted, 2 vol. 8vo. London, 1771.

Mr. Edwards further states in his pamphlet, that we have no edition of Crevier's Histoire des Empereurs, except Mill's translation. In the King's catalogue he would have found an entry of the splendid edition of that work, printed in 1756.

4668. These errors naturally arise from the imperfect state of the catalogue?—No; from the haste with which Mr. Edwards probably wrote his book. The King's catalogue is perfect. It was printed before 1820, and these works existed in it before that time.

4669. But the catalogues in the reading-room are in a confused and imperfect state, are they not?—They must unavoidably become so in the course of time, as new books are added. In entering books in alphabetical order, we cannot always calculate the blank space which ought to be left for new editions of books, or for the works of new authors; hence, for want of room, we are sometimes obliged to insert them as near their proper place as we can. When a manuscript page becomes too crowded to be used, with convenience, the titles in it are transcribed in their proper order, and the new leaf is inserted in the place of the old one. Finding it frequently necessary to remove these overcrowded leaves, it was judged expedient to prepare forthwith a complete transcript of the whole of the manuscript portion of the printed book catalogue.

4670. Will you apply your answer to another paragraph in page 20 of the same pamphlet, with regard to the works in Belles Lettres. Are the works of Chateaubriand in the Museum?—They are not complete; an edition in four volumes, and portions that are stated here, not to be in the Museum, are in the Museum; Les Martyres appears in the reading-room catalogue.

4671. Is the work of Quérard in the catalogue?—It is not in the catalogue, but we have two copies in the Museum, in constant use for the officers.

4672. Are there any works of Victor Hugo and La Martine?—Some of La Martine's; we have one or two of Victor Hugo's, but nothing of any consequence. French and German novelists we have not much attended to. It is a sort of literature that we have not at present, in many instances, particularly wished to purchase; limited as the reading-rooms are in their accommodation for readers, and considering the character of the writings of the French novelists, I do not think it desirable that young men should have easy access to such productions in the Museum. We have frequently found young men, who are admitted to the Museum, reading books that were extremely improper, and, at one time, they were handed from one to another, not only to the corruption

The Rev. *Henry H. Baber.*

2 June 1836.

ruption of their own minds, but from prints therein contained, annoying to their neighbours. Hearing of this, I ordered such books to be locked up, and desired that if they were asked for, the person wanting them was to apply to me, and the consequence has been a check upon it.

4673. Having adopted that check, does not that furnish a reason why the principal works of foreign authors should be regularly supplied to the Museum, since, whatever be their character, you have the means of checking any improper use made of them?—But we cannot buy everything, for want of funds; my opinion is, that everything that can be obtained, ought to be deposited in a public library. With respect to the use of them, if a bad use is made, it may be put under restrictions.

4674. In that point of view would not it be desirable that there should be a systematic selection from foreign writers, so as to insure at all times possession of the works of the principal foreign authors?—Yes.

4675. Does the Museum possess, to any extent, any Danish literature?—Not to any considerable extent.

4676. Is there any one who is competent to advise purchases of Danish literature in the Museum?—Yes.

4677. Do they attend to it?—Sometimes; and some books have been bought, but very little Danish literature comes into this country, and very few Danish catalogues of books also. The works printed in Denmark, Sweden, and Russia are very few in number, in comparison with what is published in other parts of Europe; and the readers of such productions are also very few. Few as those readers, however, are, yet if we had the means, we should be glad to purchase them for the use of those few.

4678. An accurate classed catalogue would point out those deficiencies under particular heads, would it not?—Yes.

4679. You have referred to some errors in this pamphlet of Mr. Edwards; are there not several distinct catalogues of printed books which it is necessary to refer to, with a view to ascertain a fact of that description?—There is the King's catalogue, the interleaved catalogue, and the additional lists, and the catalogue of the maps, the geographical collection in the King's library, and there is a manuscript catalogue of the collection of books relating to the History of the Interregnum of Oliver Cromwell, formed by George the Third, and deposited in the reading-room.

4680. Is there not also a catalogue of Sir Joseph Banks's library?—There is.

4681. Is there not a large collection of pamphlets on the French Revolution?—There is, and a catalogue of it was in the course of preparation, but it was stopped, that we might proceed more rapidly with the general alphabetical catalogue.

4682. Will the catalogue that is now forming, comprehend and consolidate all those various catalogues?—It will embrace everything that is in the Museum, every printed paper and book that we have.

4683. Then when that is done, the classed catalogue may be made without great loss of time from that?—Yes.

4684. And that, in your opinion, is a most desirable and important work?—I consider a classed catalogue desirable, but not so desirable as an alphabetical, with an index.

4685. Assuming the alphabetical catalogue to be completed, a classed catalogue would be a very desirable work?—I think the most desirable work then would be an index to the alphabetical catalogue.

4686. Would you then leave such classes of readers as frequent the Museum, and desire to know what may be in the Museum upon a particular subject, without knowing the authors' names, still without means of ascertaining the contents of the collection?—No, I would not; if we had funds, I would have everything, a classed catalogue and an alphabetical catalogue, and an index to the alphabetical catalogue.

4687. But the classed catalogue would comprehend the advantages of the alphabetical catalogue if it had an index?—It would if it had an index of the authors' names.

4688. Then is not it desirable that that should take the precedence?—Not in my opinion; I cannot divest myself of the opinion of the utility of an alphabetical catalogue preceding.

4689. Is

4689. Is there any complete set of the London Gazettes in the Museum?—Yes.

4690. How long has the Museum been in possession of a complete set?—The accession of the King's library made the collection most complete, with the addition of the set in that library; we have got the Gazettes complete up to within the two years; we get them now from the Stamp-office.

4691. Have you an index to it?—We have indexes to the set.

4692. You have now, but how long have you had it?—I made a report of the state of the Gazettes in 1830, in which I stated that the index was then complete, except for 1815, and that we have not yet been able to procure.

4693. For some time were not you without the indexes to the Gazettes, whilst they were published by authority?—Ever since the King's collection has been with us, we have had the indexes regularly supplied; the bookbinder purchases the indexes as he wants them for the volumes he binds annually.

4694. How do you manage to select the duplicates of the library for sale?—When such selection is necessary, we compare book by book, and turn out the worst copy, provided it is not a gift or with any manuscript notes in it, or any peculiarity for which we should keep it; we may have two copies of a book, one upon vellum and one upon paper, and that is considered one amongst many other peculiarities which makes it necessary to keep duplicates.

4695. You keep duplicates of all donations?—We do; duplicates of donations have been parted with many years ago, but not recently.

4696. Can you give some instances of duplicates that were parted with some years ago?—When Mr. Beloe was librarian, some duplicates were parted with.

4697. Do you refer to some irregularities that occurred at that time?—I do not refer to the irregularity with respect to the prints; but if we had two copies of a book, it was considered not necessary to keep them both, and the worst was sold, though it might have been a copy presented by gift; but finding that that practice gave offence, such books have not been parted with, and we have got now above 20,000 volumes of duplicates retained, owing to one peculiarity or another.

4698. Supposing a book to be given which you have already in the library, do you mark that at once as a duplicate, or do you reserve the stamping it as a duplicate copy till the time of sale?—We do not stamp it till the time of sale, for they are stamped with the year in which they are sold.

4699. Is it at all within your time that a copy of a Greek Testament was sold, the title and particulars of which were published in the catalogue of Lee and Sotheby, which is now put into your hands (*the same being shown to the Witness*)?—No, it was before I was attached to the Museum.

4700. Do you know anything of the book?—I have heard of it.

4701. It is not a work which you would have turned out as a duplicate, if you had been at the head of the department then?—Not knowingly.

4702. Are any of the duplicates of the Royal libraries ever sold?—Duplicates which formed part of the royal books transferred to the Museum in the reign of George the Second have been sold, but that practice has been abandoned ever since the year 1805.

4703. Do you mean that if they have been sold at all, they have been sold carelessly or from accident?—No; they were sold knowingly and purposely when Mr. Harper had the care of the collection.

4704. Lord *Stanley*.] How long ago were they sold?—Forty years ago.

4705. By whose authority were they sold?—By the authority of the Trustees I suppose; but I know nothing of the circumstances under which they were sold.

4706. Mr. *Hawes*.] The work now put into your hands, "Streinius's Stemmata," was that any part of a Royal collection?—The Royal mark is upon it.

4707. What year was that sold in?—1787.

4708. Is there a copy now in the Museum?—There must be one, else it would not have been parted with.

4709. Another work is put into your hands, called a "Key to Civil Architecture," by Thomas Caife. What is the date of the duplicate mark there?—1830.

4710. Is that a Royal book?—No; after the Royal books in George the Second's time came to the library, all the books received from Stationers' Hall had a rose and crown stamped in gold on the back of them, as we received

The Rev. *Henry H. Baber.*

2 June 1836.

such books by virtue of the King's privilege; but since the passing of the Copyright Act in 1814, that practice has been discontinued, because we receive them since that time by our own privilege, and we put B. M. upon the back of such books now.

4711. Will you read the title of that book (*another book being shown to the Witness*)?—De Bononiensi Scientiarum et Artium, Instituto et Academia Commentarii.

4712. Is that one of Sir Hans Sloane's books?—It is.

4713. Is there a manuscript note or title, written by Sir Hans Sloane?—Yes; the Sloane books being purchased, and we considered, if they proved at any time to be duplicates, we might part with them, as we do with all purchased books, when they come under such circumstances.

4714. Have you better copies in the Museum?—We have better copies; we always keep the best.

4715. How lately have any of these been sold?—This was sold in 1818.

4716. Are the better copies that you have a portion of the original Sloane library?—No.

4717. In what respect is the copy that you have of this work superior to that?—The one in the Royal library is infinitely better in condition, cleaner and in a better state of binding; we have two copies of the work in the Museum now.

4718. Then you have turned out some of the books of the founder, and retained others instead of them, upon the ground that they are better bound, and something cleaner?—In better condition, and as being in every respect better copies; if they had been equal in condition, we should have retained the Sloane books. We have two copies of this book now; one is from King George the Third's library, and the other was given us by Sir Richard Colt Hoare.

4719. With reference to opening the Museum generally during the Easter and Whitsun holidays, have you any opinion?—The only objection seems to me, that it would bring a vast influx of people, who would be almost unmanageable; crowds of people intoxicated, and not so well conducted as at other times.

4720. With regard to extending the hours of admission to the reading-room, and to the use of the library generally, during the hours of daylight, what is your opinion?—It would be an increase of labour, and of course an increase of attendance would be wanted. It would be a question of expense.

4721. No other objection strikes you than the increase of expense that would be incidental to it?—There would be a want of time to return the books which had been in daily use to their places; but this objection might be obviated by making a different arrangement with respect to the putting up the books: we must have a class of men solely for that purpose.

4722. Lord *Stanley.*] Are the whole of the regular attendants in the library employed in that labour?—A portion of them only.

4723. For what length of time are they employed in it?—An hour before, and an hour after the Museum is open, during six months of the year; an hour before the Museum is open, during the winter six months. They are further employed till near twelve o'clock in the day, before they can get the books which have been in daily use restored to their places.

4724. But after the readers have left the room in the evening, what length of time is taken, upon the average, to get the books replaced?—They put the books up, as far as they can, till five o'clock; and after that, they leave them till the next morning: the time varies according to the quantity out.

4725. Mr. *Hawes.*] You are aware that the hours are different from what they were some years ago?—They are.

4726. Do you know the reason for altering them?—No.

4727. You never heard any cause assigned for the alteration?—No.

4728. What do you think of the expediency of returning to the hours as given in the original regulations of the Museum?—It would depend on the officers and attendants that would be required. As there would be an increase of labour, additional assistance, or an increase of income to those who might be called upon for an extension of their services, would be required. The reading-room is open more than any other reading-room in the world.

4729. What is your opinion as to the propriety of admitting scientific men into

The Rev. *Henry H. Baber.*

2 June 1836.

into the Board of Trustees, supposing them to be chosen by certain chartered learned societies to be named?—I have never considered the subject, being perfectly well satisfied with the Trustees that superintended the Printed Book department, men of very high attainments in literature; and therefore I do not see what advantage, so far as my department is concerned, an astronomer, or a geologist, would be to me. It is a question that applies to other departments rather than mine.

4730. But still, men who are distinguished for their knowledge of literature, you have found very serviceable in your department as Trustees?—I have.

4731. Supposing the management of the Museum were vested in the heads of the departments, as a committee for the general management of the institution, subordinate to the Board of principal Trustees, what is your opinion of such a mode of managing the Museum in future?—I think benefit might accrue to the institution by it; as all the reports made by the respective officers of their proceedings; all proposals for increasing the collections in the Museum by purchase, or by any other means; all suggestions for the benefit of the establishment, would, by being previously submitted to the consideration of the officers, and discussed by them at their board, come before the Trustees in a shape and manner, and with an authority, which would cause them to attract the attention of the Trustees more forcibly, perhaps, than they now do in many instances. Such a meeting of the officers might further tend to promote amongst them a more general interest in the welfare of the Museum, and bring before each other's notice observations and suggestions respecting each other's departments, which, under present circumstances, they think it intrusive and impertinent to make.

4731.* Had you recently offered to you, for sale, a complete set of the Transactions of the old Cortes of Spain?—That must be a manuscript.

4732. To Mr. *Forshall.*] Was a complete set of the Transactions of the old Cortes of Spain offered to the Museum?—Yes there was, in 21 volumes.

4733. At what price was it offered?—The sum asked, when the collection was first brought under the notice of the Trustees, was 250*l.*

4734. What was the sum paid?—£. 168: but in the purchase at this last sum were included printed books, valued at 25*l.*, and 14 other MSS., worth not less, I think, than 15*l.* or 20*l.*; so that the cost of the Cortes papers did not exceed 128*l.*, at the most.

Mr. *Edward Edwards,* called in; and Examined.

Mr. *Edward Edwards.*

4735. Mr. *Hawes.*] YOU are the author of a pamphlet on the Minutes of Evidence taken before the Committee on the British Museum?—I am.

4736. You have given in the course of that pamphlet a statement of the deficiencies of the library?—I have given some examples of those deficiencies.

4737. In page 19 you instance some of the deficiencies in German literature?—I do.

4738. Have you heard the evidence which has been given by Mr. Baber in reference to the statements made in that pamphlet?—I have, as regards two of the examples quoted in that pamphlet. I have instanced about 16 German authors of considerable note, whose works are not to be found in the British Museum. Of these, two only have been referred to by Mr. Baber. Perhaps I had better state, that I have prepared four lists as examples of deficiencies in the Museum Library. The first is a selection of German works wanting; the second, of French works; the third is a list of books published on the Continent, in the three months between January and April 1832, in the several departments of History, (including Biography and Travels,) and Fine Arts; distinguishing those works which are not to be found in the British Museum; and the fourth, a list of works on Architecture, authors' names *A* to *C*, extracted from a list given in the last volume of Stuart's Dictionary of Architecture, distinguishing, as before, those works which are not in the Museum; the number of these is 46; the total number given is 93.

Mr. *Edward Edwards.*

2 June 1836.

EXAMPLES of Deficiencies of Books in the Library of the British Museum, from an Examination of the Catalogues in October 1835.

LIST I.—Foreign Literature.

Examples of *German* works wanting.

Of the works of Goethe, all those published since 1819.	Of the works of Ch. Schlosser, all but 3 vols. of his "Weltgeschichte," and two French translations.
— Herder,* about seven-eighths, (34 vols. out of 40.)	— Jean Von Muller, all are wanting.
— Kant, the greater portion.	— J. W. Menzel, the same.
— Schelling, all but 2 vols.	— J. H. Voss, the same.
— Jean Paul Richter, all but 1 vol.	— J. Voss, the same.
— Fichte, the same.	— C. T. E. Hoffmann, the same.
— Frederick Schlegel, 15 vols. out of 20.	— Tieck, the same.
— Frederick Raumer, 14 works out of 15†.	— J. V. Voss, the same.
— Niebuhr (the historian of Rome) the miscellaneous works.	— C. D. Voss, the same.
	— Laun, the same.
	— Gellert, the same.
	— H. Heine, the same.

See also Lists III. IV. and VI.

* A copy of the entire "Sämttliche Werke" of Herder is entered in the catalogue of the Royal library, but appears never to have been received at the British Museum.

† Besides this one work, the "Hohenstauffen," there is in the Museum a translation of the "Briefe aus Paris, &c., 1832," by Lord F. Egerton.

LIST II.—Foreign Literature.

Examples of *French* Works wanting, in History, Philosophy and Legislation.

Of the works of Guizot, all are wanting.	Of the works of Paul Louis Courier, all are wanting.
— Thierry, important works are wanting.	— Charles Comte, the same.
— Villemain, the same.	— Damiron, the same.
— De Barante, the same.	— Degerando, the same.
— Anquetil, the same.	— Cousin, there are only 2 vols. of "Fragmens," two American translations, and his "Rapport sur l'Instruction en la Prusse."
— Armand Carrel, all are wanting.	
— Des Michels, the same.	
— Du Rosoir, the same.	— Quérard, that valuable guide-book, "La France Savante et Littéraire," is wanting.
— Matter, the same.	
— Poirson, the same.	

As to Belles Lettres, it may suffice to state, that for the works of recent celebrated authors in this department, the library of the British Museum will almost uniformly be searched in vain.

See also the following List (III.)

LIST III.—Works published on the Continent in the Departments of History (including Biography and Travels) and Fine Arts, between January and April 1832; distinguishing those which are not to be found in the British Museum.

The asterisks distinguish those which are not to be found in the British Museum.

4739. How do you obtain those dates of the third list?—The list is extracted from Quarterly Reviews of all the principal books published on the Continent in those three months. The number of them is 53, and four only were to be found in the British Museum in October last, when that list was taken.

4740. How did you ascertain those deficiencies in the library?—By extracting the list, and then going through the alphabetical catalogues; first, those of the general series of books; and secondly, those of the Royal library.

4741. You went through the catalogue of the Royal library?—I went through both of them.

4742. Assuming Mr. Baber's statement to be a correct statement, can you account for your error in any way?—The errors which have been stated are two: the first relates to the works of Göthe; I think Mr. Baber's correction will only apply to a series of 20 volumes, published at Tubingen in 1819, and that all the works of that author since that date are really not in the Museum at present, or, at least, not in the catalogues. The second example, that of Wieland, would appear to be an error, arising from the circumstance of having several catalogues to look at under the same alphabetical arrangement.

4743. With reference to those catalogues, how are the author's names entered; suppose the name to be D'Israeli, is it entered under D or under I,

or

Mr. *Edward Edwards.*

2 June 1836.

or is it entered under both?—There is a great uncertainty as to that point, which increases the trouble of searching the catalogues. As mention has been made this morning by Mr. Baber of an intention to place in the reading-room a transcript of the alphabetical catalogues, I wish to make a general remark or two upon them; I doubt not those catalogues will be revised, but it is important that some easily intelligible plan should be followed in that revision. It seems to me that the great difficulties of research in the reading-room of the British Museum are twofold, and arise, first, from the want of classed catalogues; and secondly, from the defects of the present alphabetical catalogues, both in plan and actual condition. As to the first, the difficulties occasioned by the want of a general classed catalogue, they have, I think, been already so fully and convincingly stated to the Committee by former witnesses, that it would be wasting its time to go over them again; but having myself experienced the extreme want of such a catalogue during the last two years, I would make one remark in further illustration of the subject and in reference to a work which has been already alluded to this morning, "Watt's Bibliotheca Brittanica;" I think a statement of the nature of the alternative to which a reader resorts in the absence of a classed catalogue, will show the necessity of some immediate improvement. Suppose a person should want to know what books there are in the British Museum on the subject of "Tithes," the only course he can at present pursue is, to take Watt's fourth volume, and turning to "Tithes," thence extract all the titles of books given. Suppose there be 20 titles, he must then, by the help of certain numerals affixed to those titles, have recourse to Vols. I. & II. to find, one by one, the names of the authors of those 20 works; having made a list of them, he may then refer to the alphabetical catalogues of the general series of books in the Museum, having probably to consult a separate volume for every book, and then make a second and similar reference to the catalogue of the Royal Library: with respect to such books as are not found in either, there will be no certainty whether or not they are in the Museum, without reference to the yearly addenda lists, of which there are seven or eight, because some works given in those lists are not to be found in the general catalogues; I have myself written for books which had been two or three years in the Museum at the time of application without obtaining them; because their titles were not in the general catalogues, although I have afterwards, in searching the yearly lists for other purposes, casually found such titles in them; this was, I remember, the case among others, with Sir F. Palgrave's "Rise and Progress of the English Commonwealth," received in the library in 1832, but which I could not get in 1835. With one general classed catalogue such accidents as these would not be likely to occur. The difficulty of reference is further increased by the want of a clear arrangement of those works in the library of the British Museum which are anonymous.

4744. How are anonymous works entered in the alphabetical catalogue?—I do not think any consistent plan is followed in that respect; I have extracted some instances. Works on the history and general policy of the United States of America may be found under "America," "United States," "Constitution," "Congress," "Commerce," "State Papers," and some other heads of reference, and as there is no sufficient means of distinguishing between those works, there can be no certainty of finding them, unless a great number of volumes be searched. I may give some further examples of the want of system in making entries in the present alphabetical catalogues, which will, I trust, be obviated in the new ones; we have, for instance, such anachronisms of entry as "Cartes, Des," "D'Arblay," "Du Mas," "D'Israeli," "Fontaine, Le," "Israeli, D'," "La Fayette," "Le Roux," "Le Roy," "Pierre, St.," &c., and frequently part of the works of an author, whose name has such a prefix, are under one letter, and part under another letter, and therefore in another volume; so with reference to anonymous works; under "Reports," we have "Reports on the Public Records," "Reports of the British and Foreign School Society," and of the "National School Society," and "Reports of Chancery Cases, by Brown;" while other "Reports on the Public Records" are entered under "Records," other "Reports of the British and Foreign School Society," under "Society, B. & F. School," other "Reports of National School Society," under "Education," and other "Reports of Chancery Cases, by Jackson," under "Jackson," and others again under "Chancery." Many anonymous books, too, are entered where scarcely any one would look for them, *e. g.*

Mr. *Edward Edwards.*

2 June 1836.

"History of the National Debt," under "History," "Dissertation on the Saxon Chronicle," under "History," "Specimens of a Translation of the Holy Scriptures into the Eastern Languages, by the Brethren of the Serampore Mission," under "Specimens," &c.

4745. Do you assign that as a reason for having fallen into error in those instances which have been pointed out?—It shows the great difficulty of correctness in any search of that nature.

4746. With reference to the deficiencies in the belles lettres, there also an instance of error has been pointed out. Mr. Baber has said, that "Les Martyres" and "Atala," are to be found in the library?—I can only account for that in the same way; I used the best research that I could, and I had no doubt till this morning of the correctness of all those statements; but there is very great difficulty. I devoted several mornings to it, and I think I must have consulted from 45 to 50 volumes of catalogue.

4747. You are a German scholar?—I am a reader of German.

4748. Have you found any deficiencies in that branch of literature?—I have observed very considerable deficiencies in that branch.

4749. With reference to scientific works, have you had occasion to refer to them?—Yes; and I have already put in a list of works on architecture (No. 4,) in illustration of deficiencies in scientific works. The examples I have given to illustrate the want of foreign literature, are those of distinguished authors, (Nos. 1 & 2), and works published in different parts of the Continent, (No. 3); and I have already stated, that out of 53 works in history, &c., published during those three months, only four are to be found in the Museum; that is a statement, I think, not affected by any explanation given this morning.

4750. You have long frequented the reading-room?—I have for above two years visited it almost daily.

4751. Have you generally found facilities in obtaining what you wanted?—As far as the present regulations permit of facilities being afforded, and as far as the officers and attendants are concerned, I have met with every facility; but I certainly do think, that in respect of the regulations, much greater facilities might be afforded to readers.

4752. Will you state some of them?—It appears to me that chiefly in three respects the facilities for readers might be increased without any difficulty. In the first place, the present hours are very inconvenient, they are very confined, and necessarily have the effect of shutting out many persons altogether. I have been enabled for some time to frequent the Museum, in the present hours, but I cannot expect to do so constantly for a much longer period, and unless the hours are extended, I shall be precluded from continuing to consult the Museum. It seems to me, that it would not be difficult to increase the time, both in the morning and in the evening, by opening the Museum at eight o'clock instead of 10, and by extending the time in the evening probably till eight o'clock, provided an increased number of attendants were furnished. I would also say that I cordially concur in the recommendation of Sir Harris Nicolas, for the establishment of an evening reading-room; I think that would open the Museum to many persons who are quite precluded from it at present, persons who would make a very good use of it, not only for themselves, but for the public; and that view has been supported by some petitions, especially a petition from schoolmasters, already presented to The House, praying for extension of hours. The second respect in which it appears to me that the facilities might be increased, would be by a better provision for furnishing to the Museum, foreign literature regularly, and a better provision for collecting all the works of English authors. With respect to foreign books, it should not be done merely on the casual mention of a particular work, but it should be done, I conceive, as a matter of course. The third respect, in which I would suggest that the facilities might be increased, is with reference to catalogues; I think it would be a great convenience, if a classed catalogue were immediately furnished to the reading-room, to such an extent as the progress already made in the work which was described to the Committee by the last witness, will permit of, together with an alphabetical index of the authors' names.

4753. It would be more useful than the alphabetical catalogue?—In my opinion it would be far more useful; I have lost many days for want of such a catalogue. It appears to me that it would be very convenient when the classed

catalogue

catalogue has been completed, if the yearly addenda lists were published for sale, because then any reader would be able to keep pace with the collection, as to his knowledge of its contents, and would find it very easy of reference, provided the classed catalogue itself were also purchaseable in separate faculties, thereby meeting the wants of different classes of readers.

4754. Do you find the reading-room sufficiently spacious for the numbers frequenting it?—At present it is not; but, I believe, the present reading-room is not intended to be a permanent one. It is exceedingly ill ventilated and warmed, and I remember that this defect has occasioned a remark by Mr. Von Raumer, the celebrated German historian, in his book on England, in which he complains of it very strongly. I have myself found the same inconvenience repeatedly. I may mention that another improvement would be, the attendance of a librarian, or assistant librarian, in the reading room, according to the established regulation some years ago. Every one who has frequented the reading-room will bear testimony to the courtesy and attention of the officer at present attending it in chief, but as he is not expected to be a person of literary attainments, he is, of course, not able to give much assistance in matters of research of any kind. What he is able to do, he does very willingly, but assistance of a literary nature is not expected of him; and although I do not doubt the willingness of the librarians to give their assistance upon all occasions, they are not so accessible as if one of them were present in the room.

4755. Lord *Stanley.*] Does not it appear to you, that it would be a great waste of the time of a man of literary attainments, if he were kept constantly waiting in the reading-room, in order to be close at hand when applied to by any casual reader, and that any references which it may be necessary to make, are not equally well made by their being in the immediate neighbourhood, where they are not distracted from their own pursuits?—I think I can say, that at present desirable reference to the librarian is not equally well attained; not only is there a feeling of unwillingness to obtrude, when you know that important labours may be going on which interruption may injure, but there is generally much delay about it; there is not that readiness of access which you would have if the librarians or assistants were, by turns, in the reading-room, according to the former practice.

4756. Would you not consider it rather below the situation of a gentleman of sufficient eminence to fill the situation of librarian, if he were compelled to give attendance in the reading-room?—I do not think it should be so considered; it is a frequent practice on the Continent, and it was so in the Museum itself formerly.

4757. Mr. *Hawes.*] You have referred to the catalogue of printed books. Have you had occasion to consult the catalogue of manuscripts?—I have frequently; the difficulty of search there is still greater, because, besides a great number of MSS. yet uncatalogued, there are many volumes of catalogues that have no indices of any sort, and of course, certainty as to there being manuscripts in the Museum on any particular subject cannot be obtained, unless you consent to sacrifice many weeks' labour; it may, therefore, be said, that there are at present no means of attaining any certain knowledge of what the manuscript stores of the British Museum afford upon any given subject.

4758. Can you give any instance of difficulties that you have had to contend with from the want of catalogues of the manuscripts?—No particular instance occurs to me at the moment. I have lost a great deal of time from the difficulty of search, but that is a thing of every day occurrence. In respect of the deficiencies of books, I wish to put in a list, to which I before alluded, as to the books due under the Copyright Act. I have taken works published between December 1834 and July 1835, whose author's names come under the first three letters of the alphabet, and within those limitations, I find 48 such works wanting in the Museum.

Mr. *Edward Edwards.*

2 June 1836.

[*The Witness delivered in the same, as follows* :]

LIST V.

EXAMPLES (A. to C.) of Works Published in London between December 8, 1824, and June 8, 1835, due under the Copyright Act; not in the Library of the British Museum in October 1835.

This List does not include Novels.

*Albrechtsberger, Theoretical Works, translated by Merrick, 2 vols. 8vo.
*Alexander, J. E, Sketches in Portugal, 8vo.
*Anderson, R., Discourses on Commerce. 12mo.
*Anecdota Græca Oxoniensa. Edit. Cramer. vol. 1.
*Aitken. Sermons and Lectures. 8vo.
*Adams on Care of Oil Paintings. small 8vo.
*Ansell. Treatise on Friendly Societies. 8vo.
*Arnott. Bibliopega, 18mo.
*Ashe on the Book of Revelations. 12mo.
*Allen, Lieut. W. Views in Ascension Island. imp. 8vo.
*Abdy. Residence &c. in North America. 3 vols.
*Bowles, W. L., and Nichols, J. Antiquities of Lacock Abbey, Wilts.

March.

*Bean. Atlas of Classical Geography. royal 8vo.
*Bourgery. Minor Surgery. (tr. from Fr.) 8vo.

April.

*Baines, Edward, History of Cotton Manufacture.
*Beattie. Switzerland Illustrated. 4to.
*Burnett. Outlines of Botany, 2 vols. 8vo.

May.

*Barbaconi. Compendious Literary History of Italy.
*Barrow. Visit to Ireland. 8vo.
*Bessel. New method of Lunar Distances, 8vo.
*Bostock. Sketch of the History of Medicine.
*Boteler. Voyage of Discovery to Africa. 2 vols. 8vo.
*Bury, Lady C. Journal of the Heart. 2 vols. 8vo.

June.

*Barlow. Experiments on Malleable Iron.
*Badcock, Lieut. Col. Journal in Spain and Portugal. 8vo.
*Bennet, Solomon. Treatise on the Hebrew Language. 4to.
*Breton. Tour in Norway, 8vo.
*Bellchambers. Biographical Dictionary. 4 vols.
*Beckford, William. Excursion to Alcobaça, &c.
*Bolton, George. Practice of Criminal Courts, &c.
*Butler, Mrs. Journal in America. 2 vols.
*Brougham, Henry. Natural Theology.

January.

*Cooke. Events in the South of France. 8vo.
*Copley. Law of Landlord and Tenant. 12mo.
*Crofton. Upholsterer's Companion. 4to.

February.

*Child, Mrs. Oasis. 12mo.
*Child, Mrs. Appeal in favour of American Indians. 12mo.
*Cadell. Campaigns of the 28th Regiment. 8vo.
*Clarke, C. C. Riches of Chance. 2 vols. 8vo.

March.

*Costello, Miss. Specimens of Early French Poets. 3 vols.
*Cockburn. Corporations of England and Wales.

April.

*Coleridge, S. T. Table Talk. 2 vols. 12mo.
*Colton, C. C. Modern Antiquity and other Poems.
*Collier, J. P. New Facts respecting Life of Shakspeare.

May.

*Calder. Memoirs of Simon Episcopius. 8vo.
*Cary, H. Testimonies of the Fathers, &c. 8vo.
*Clarke, James. Treatise on Consumption. 8vo.
*Clarke, E. W. Twelve Sermons to Labourers, 8vo.

4759. Lord *Stanley.*] What is the nature of those works?—They are general works published in London, whose authors names extend from A to C. I am quite aware that there will be some uncertainty as to the correctness of that list, because it may be that some of those works were in the Museum, but were not catalogued; I have however carefully examined the catalogues, and as far as they go, I believe it to be a correct list; there may be also this other difficulty, that the alphabetical lists for the years 1834 and 1835, were not then and are not now in the reading-room, so that no omissions in the alphabetical catalogue can be supplied from them. Those yearly lists at present extend only to 1833; those for 1834 and 1835 are wanting.

4760. How do you propose to obviate those difficulties?—It appears to me to be very clear now, that there is little probability indeed of the law being so executed and so complied with, as to furnish the Museum regularly with English books; it seems, therefore, that an alteration of the law is imperatively called for.

4761. Have you ever had occasion to refer to coins and medals in any historical pursuits?—I have had occasion to do so. I had occasion to do so, for instance, in a matter of French history, about three months ago. I have met with every attention on the part of the keeper in that department, but very great difficulty from the want of any sufficient catalogue at all applying to the particular matter I was in search of on that occasion; reference was made by the keeper of that department to two or three printed works not connected with the Museum in any way, and not being found in those works, it was inferred that they were not in the Museum, although it was not certain whether they were there or not. In so large a collection of course the memory

of

Mr. *Edward Edwards.*

2 June 1836.

of the keeper alone could not answer the question. I would also observe with respect to the department of prints, that considerable difficulty has occurred to persons having occasion to refer to them, on account I conceive of the present departmental arrangements. During the long illness of Mr. Ottley, who is recently deceased, it was exceedingly uncertain whether you could obtain admission or not to the print-room, and on obtaining admission, you were frequently obliged to depart without obtaining what you wanted.

4762. You are aware that Mr. Ottley was absent on account of ill health?—Yes; and I believe that at no time was neglect of duty chargeable on him personally; but it appears to me that if there had been proper assistance in that department, the absence of the superior officer would not have occasioned inconvenience to persons desirous to examine the prints. With reference to the library, I would also mention to the Committee, that if some better arrangements were made with respect to Parliamentary Papers, a great increase of usefulness would be attained. The Sessional Papers for 1834 were not received at the Museum till December 1835, and then they were not perfect, so that some 15 months had elapsed after the publication of many of the papers of that Session, before they were received at the Museum.

4763. Can you state in what respect they were imperfect?—I think four volumes were wanting.

4764. Do you know anything of the classed catalogue of the library at Dresden?—I have no personal knowledge of it; but I have a knowledge of it from a German book which I hold in my hand; it is intituled "Merkwürdigkeiten Dresden's." It is a sort of guide book to the institutions and curiosities of Dresden.

4765. By whom is it published?—The account relating to the library I believe to be furnished by one of its officers. It contains a detailed account of the mode of classification pursued there. I call the attention of the Committee to it, because the Dresden Return, in the Appendix to the last year's Report, is very short and imperfect. If the Committee will allow me, I will put in a translation of the detail of classification. [*The Witness delivered in the same. See* Appendix.] In further illustration of what appears to me very important—the deficiency of foreign literature in the British Museum—I have taken a list of the German works referred to by Mr. Connop Thirlwall in the first volume of his History of Greece, a book of very high value, and I have marked those which are in the British Museum, and those which are not there; that I will also put in.

[*The Witness delivered in the same:*]

EXAMPLES of DEFICIENCIES of BOOKS in the Library of the British Museum, from an Examination of the Catalogues in October 1835.

LIST VI.

List of the Works of *German* Historians, &c. referred to as authorities by Mr. Connop Thirlwall in the first Volume of his History of Greece, distinguishing those which are to be found in the Library of the British Museum; in further exemplification of its Deficiencies in *German* Literature.

The asterisks distinguish works wanting, as before.

The accuracy of my statement respecting some German authors having been questioned, perhaps I may be allowed to mention one or two others which I have found to be deficient since making that statement. I have in myhand a list of 14 works of Frederick Schlegel, one of the most distinguished Germans of the present age. In the British Museum I find only four of his works; one of the four being a translation merely. I have also a list of the works of Frederick Von Raumer, the historian; of them there are 14, and only two in the British Museum.

4766. Have you anything else that you wish to mention?—There is one thing more I would wish to mention, as the Committee have to consider the possible means of improving the Museum, and extending its usefulness in general. It has reference to the department of MSS. Sometime ago it was suggested by a highly respected nobleman, who is now deceased, Lord Dover, that it might be advisable to remove certain public documents which have ceased to be of any public value, except in an historical point of view, from some of the repositories in which they are preserved to the British Museum. I beg to request the attention of the Committee to that suggestion; there are some manuscripts in the British Museum which are imperfect from the want of other manuscripts which are to be found in record repositories not accessible to the public in the same way as the British Museum. The correspondence of Wolsey, for instance, is partly in the Museum, and partly in some record depository. In the State Paper Office there are many manuscripts invaluable as historical materials, as State Papers now without any value at all, to which the suggestion would apply most strongly. If such manuscripts were brought together in the British Museum, a great service would be rendered to the public.

4766*. *Chairman.*] Have you any further observations to offer?—With reference to the printed books, I believe the three points already enumerated, viz. extension of hours and provision of evening reading-room; publication in faculties of a general classed catalogue of the whole collection; and better supply of foreign literature; together with a revision of the clause in the Copyright Act, will embrace the chief improvements to be desired. I think it would contribute to the security of the books if, in the new buildings, provision were made of a distinct room in which to deposit books retained in use by the readers, instead of allowing them to remain in the reading-rooms as at present. I would add that I think the establishment of one or more additional libraries in the Metropolis a subject highly deserving the consideration of the Committee. There exist more than one endowed foundation, such as that of Archbishop Tennison's Library, in St. Martin's-in-the-Fields, which might be made the basis of such branch libraries; and I think that such a disposition of the duplicates of the British Museum as would aid this object, would be far more advantageous to the public, than the continuance of the present practice of selling them. With reference to the manuscripts, I think it desirable that in addition to a general classed catalogue, the importance of which was so much and deservedly insisted on by former witnesses, there should be published separately a more fully descriptive catalogue of that portion of them which relate to English history; it might be such a catalogue as was suggested by Mr. Planta in 1801, for the public records in the Museum. With reference to the present department of antiquities, I think a subdivision of it would increase its usefulness, and that the marbles, prints and coins, should each have a separate and responsible keeper; that distinct catalogues of each should be printed for sale, that of the marbles being more descriptive than is that portion

of

Mr. *Edward Edwards.*

2 June 1836.

of the present synopsis devoted to the antiquities, and at least equally so with the catalogues of the sculpture galleries of Munich and Dresden. (See "Verzeichniss der alten und neuen Bildwerke und uebrigen alterthuemer in der Saalen der Kgl. Antikensammlung zu Dresden," 3r Aufl. 1833; and "Beschreibung der Glyptothek Sr. Majestaet des Koenigs Ludwig I. von Bayern; von Leo von Klenze & L. Schorn." Munich, 1833.) It is also highly desirable that selections from the coins and medals should be formed to illustrate history and the progress of the medallic art, and be exhibited openly without restriction.

I would add, with regard to the library, that as next in importance to the capacity of supplying the wants of the inquirer from its own stores, is that of indicating to him where such wants as itself cannot supply may be met; so catalogues of other collections in this country, and elsewhere, especially those of manuscripts, would be highly useful; a catalogue, for instance, of the Cecil Papers, preserved at Hatfield, would be of great value to any one inquiring at the British Museum into the history of the reigns of Elizabeth or of James I., it might sometimes spare him useless labour in a wrong direction, and knowing what he wanted, he might, if the object were important enough, obtain access to those papers. As Lord Salisbury permitted a catalogue to be made for the Commissioners on the Public Records, he would no doubt, if applied to, permit one to be made for the British Museum; and so with regard to the libraries of the Houses of Parliament, &c. Of the curious collection of English Tracts discovered in 1832, and destroyed by the fire of 1835, not even the contents are now known, no duplicate catalogue having been preserved. In the same points of view, I think it would be highly worthy of the Trustees of the British Museum to endeavour to collect information as to the materials for British history, &c. contained in foreign libraries and archives, and that the correspondence so kept up between such institutions and the Museum might reasonably be expected to bring with it other and not less direct advantages, and might facilitate an object so much to be desired as the general and regular interchange of the literary productions of this country and of the Continent. In conclusion, I would beg leave to press on the attention of the Committee, the importance of larger annual grants for the purposes of the British Museum, if those purposes are to be attained on a scale at all commensurate with the wants and with the means of this country.

Martis, 7° die Junii, 1836.

MEMBERS PRESENT.

Mr. T. G. B. Estcourt.	Sir Philip Egerton.
Sir Robert Inglis.	Mr. Compton.
Lord Stanley.	Lord Sandon.
Mr. Thornely.	Mr. B. Baring.
Mr. Hawes.	Mr. Ridley Colborne.

MR. T. G. B. ESTCOURT, IN THE CHAIR.

Antonio Panizzi, Esq., called in; and Examined.

A. Panizzi, Esq.

7 June 1836.

4767. Lord *Stanley.*] WHAT situation do you fill in the British Museum?—I was appointed extra assistant-librarian; I am now called additional assistant librarian; it is the same thing.

4768. When were you appointed?—In April or May 1831.

4769. In consequence of a vacancy, or as an additional extra assistant?—In consequence of a vacancy; the place was created long since.

4770. By whom was that vacancy made?—By a Mr. Walter, who retired.

4771. Before that time, had you had opportunities of seeing and knowing the management of several of the foreign libraries?—Not before that time, because I used them only as a student. I have liked bibliography all my life; and when I had the means of collecting books I did so for my own amusement.

4772. Since you have been in the British Museum, and since this Committee has been appointed, have you endeavoured to obtain the most accurate information in your power with regard to the condition of foreign institutions of a similar description?—I have.

A. Panizzi, Esq.

7 June 1836.

4773. Will you state generally, in the first place, what you consider to be the condition and state of the library of the British Museum; and then as compared with the different foreign libraries with which you have become acquainted; first in regard of extent?—In regard to extent it is a very extensive library, no doubt, absolutely speaking; but as a national establishment for this nation it is very poor; it is by far inferior to the king's library at Paris, even including the magnificent donation made by George the Fourth of the library of his father; but I believe that it stands better in comparison with foreign libraries than is generally said to be the case. There is always some mistake or other about numbers, and it is one of the most difficult things to ascertain. First of all, it seems that librarians are very anxious to make their collections appear better than they are; and I can understand that feeling myself; and then people never make a proper distinction, either in answering or in putting the question, between articles or entries, or works and volumes. The Journal des Savans is one entry and is one work, but it comprises I do not know how many hundred volumes. On the other hand, a single volume of pamphlets may contain 200 entries. I know that this mistake has been committed respecting the Göttingen library, of which so much is said. Even in the printed returns on official authority, it is stated that that library contains 300,000 volumes, and it is no such thing; it is only 200,000; but the articles are about 300,000. That I have taken particular care to verify myself.

4774. Will you have the goodness to state the order in which you would rank numerically the various libraries of Europe, so far as you are enabled to correct those erroneous statements which you say are frequently made?—I believe the king's library at Paris is the finest in the world, and I do not believe it is exaggerated at 700,000 volumes; from what I have seen it is immense. Unfortunately I have not got precise returns from Munich; but I believe that Munich comes the next. A Mr. Schrettinger, who calls himself librarian, chose not only to return no answer to my queries, but he refused it with very bad grace. The library at Copenhagen is also very extensive; it is said to contain about 400,000 volumes, and that of Berlin 320,000. The library at Vienna is a very numerous library, but I think it is not 350,000 volumes of printed books and 16,000 manuscripts, as has been asserted. There is a work recently published on that library by Balbi, who lives at Vienna, and who says that the whole of that collection consists of somewhat under 300,000 volumes, including manuscripts and portfolios of prints. The Dresden library also has been, I think, exaggerated; I think it contains about 250,000 volumes. Besides these I do not think there are any superior to that of the British Museum.

4775. Was there not some exaggeration with regard to the number of volumes in the British Museum?—I think there was at one time.

4776. Now, upon an accurate examination, what is the total number of volumes?—I think about 240,000. Mr. Baber has had them counted about four years ago, and, with the additions made since, I think it comes to about that, exclusive of the manuscripts.

4777. What are the number of manuscripts in the British Museum that are not included in the 240,000?—I believe 23,500 volumes.

4778. Then, in point of manuscripts, it would be superior in number to Vienna?—Yes; of course the number of articles is another thing. In this respect we are also superior to Copenhagen and Berlin, not to speak of Göttingen, which is not remarkable for its number of manuscripts.

4779. Are you personally acquainted with the contents of most of those foreign libraries you have spoken of?—Yes, of some. After I had got an answer to my questions, there were certain points about which I was not very clear, and there were some other points on which I had not thought it delicate to put questions. Then I thought that it would be well to see how the systems worked practically. I have not much time to spare; but I asked leave of the Trustees to have the goodness to give me an exchange of my last vacation in autumn, because then all the libraries on the Continent are shut up, although that of the British Museum is not; and then I united the month's vacation with the holidays at Christmas; and I went to Brussels, Hesse-Cassel, Göttingen, Frankfort and Paris, where I visited particularly the Bibliothèque du Roi, and those de l'Arsenal, de Sainte-Génévieve and de l'Institut. The Bibliothèque Mazarine and that of the Hôtel de Ville I have seen, but I had not time to inquire minutely into the management of them, so that the

397

A. Panizzi, Esq.

7 June 1836.

the four first mentioned, particularly the king's, are those that I examined and inquired into more closely than the others.

4780. Comparing the condition of those libraries with reference to the value of the works contained in them, in proportion to their number, in what rank should you consider the British Museum to be?—Very high. The collection of George the Third is so magnificent, not only with respect to the choice of works, but in point of the beauty of the copies, of the value of editions, of the number of large paper and vellum books, and of other typographical rarities, that, in proportion, we stand very well indeed. That collection, moreover, does not contain valueless books. There is a large proportion of very fine ones; the remainder is valuable, but scarcely any that one should not wish to see there.

4781. You would consider the British Museum, taking the two elements of number and the value of the works, to stand as high as any library in Europe?—It is very difficult to answer; as far as I know of those which have not published catalogues of their rarities, Vienna is very remarkable. We can judge that that of Dresden is a very good one, from the Bibliographical Lexicon of the late librarian, Ebert, in which he has put asterisks to the rare books that were in the library; but if you take any library of 240,000 volumes in comparison with that of the Museum, I think that for rarities and modern costly publications the Museum will surpass them all.

4782. Will you specify the libraries in Europe that you consider to be above 240,000 volumes?—I mentioned that of the King, at Paris, the Munich library, then the libraries of Copenhagen, Berlin, Vienna and Dresden; I think those are decidedly so: I know of no other with certainty.

4783. We have heard a great deal about the library at St. Petersburg; are you acquainted with the state and condition of the library at St. Petersburg?—I never could get any information respecting it; the jealousy of that government is such that nobody would take charge of my questions, because they said there would be danger in putting them, and nobody would answer them; I believe there is now a gentleman in this room who recollects the time when it was high treason to speak about it. That library is a monument of the rapacity of the most odious government that can exist. It was originally the library Zaluski, and the Russian government tell the story unblushingly that they went and carried it off from Warsaw in 1795; and from their own account of the manner in which they proceeded there never was such a thing done; they spoiled the books, and lost many. That was the most magnificent collection ever made by a private family. The Russians afterwards made a great scheme of cataloguing it, but they never did much about putting it in order. Lately they robbed the Poles of their libraries again; all the patriots who took any share in the revolution were robbed of their libraries, which were carried to Petersburg. This is what in Russia is called protecting learning. They stole those libraries and put them together, but they never made a catalogue, nor ever rendered them of any use whatever; nobody knows what they contain.

4784. The Committee have been told that it is highly creditable to Russia to have formed so immense a collection within so small a time; would you desire to see the trustees of the British Museum imitate that example?—I think we have reason rather to be proud of our poverty. The French have done the same as the Russians, but they were obliged to disgorge what they had stolen from foreign countries; they have cheated them, however, the Italians more particularly, of many of their books, and they now unblushingly show them, and boast of their fraudulent conduct. I was shown a beautiful copy of the first edition of Eustathius' Comment on Homer, printed at Rome by Blado, in 1542, one of the most magnificent books on vellum I ever saw, although shamefully cut by the Parisian binder; it was shown to me before they knew who I was, and I observed written on the top of the title-page, "Bibliotheca Vaticana, No. ..." I remarked this, adding that I thought they had returned all the books; "Oh, no," I was answered, "we have not given them all back, we have taken good care of that." As to increasing the library by such means, we had much better be without books altogether; but we had still better increase it by legitimate means, in a manner worthy of this nation, which has never been done, and it certainly ought.

4785. Mr. *Hawes.*] You say that the library has not been increased by legitimate means, and that it ought to be done; will you explain that?—I mean to say that I suppose hitherto the House of Commons have never granted money enough to buy books, and the Trustees have never got any money to give to their

A. Panizzi, Esq.

7 June 1836.

officers to buy with, and that money should now be voted in a liberal manner to supply the deficiencies. If we were to take away from the collection the King's library, and the collection which George the Third gave before that, and then the magnificent collection of Mr. Cracherode, as well as those of Sir William Musgrave, Sir Joseph Banks, Sir Richard Colt Hoare and many others, and also all the books received under the Copyright Act; if we were to take away all these books so given, I am satisfied that not one half of the books have been bought nor one-third of the value of the library has been procured with money voted by the nation; the nation has done almost nothing for the library. From 1820 to 1824 it appears, from the returns published in the Appendix to the evidence given last year before this Committee, that Parliament have voted from 200*l.* to 300*l.* a year for the purchase of books. In one of those years the small state of Parma in Italy purchased De Rossi's collection of Oriental manuscripts and books for 4,000*l.* The British Museum was founded in 1753; the Brera Library at Milan was founded in 1763, and opened to the public in 1770: it contains 200,000 volumes.

4786. Lord *Stanley.*] Then the Committee are to deduce from your answer that this library, holding a very high place both in numbers, and particularly in value, among the libraries of Europe, has been obtained chiefly by the donations of individuals to the trustees of the British Museum?—Chiefly, I think.

4787. Do you think that that argues great dissatisfaction with the manner in which the trust has been conducted?—No, quite the reverse.

4788. Mr. *Hawes.*] That is to say, that individuals have been found willing to confide their libraries to the care of the Trustees?—Just so.

4789. But considering the Trustees as composed of the highest functionaries of the country and some of the most influential persons in the country, how do you account for the small expenditure on the library of the Museum?—I cannot tell; I know that there have been often objections made to buy on all sides; buying has been suggested, and the Trustees said they could not get the money, and the Treasury said they could not get it from the House of Commons. I do not know whether the House of Commons is not ultimately in fault.

1790. Then it does not appear that the institution has derived any great benefit from very influential persons and high functionaries being placed in the trust?—The institution is one thing, the library is another. There is a return of the extra grants to the British Museum for buying collections in the Appendix just mentioned. I think the amount from 1813 to 1835 is about 80,000*l.* Now what I complain of is, that the library has not had a fair share of it, because it has not had so much as one-seventh of that sum; and without going further back than 1831, the time since which I have been connected with the Museum, if you compare the sums you will see how scantily the library has been supplied with pecuniary assistance by the nation in comparison with the other departments. I have here a statement which I should like to be considered by the Committee. It appears that from Christmas 1830 to Christmas 1831 there were 1,063*l.* spent in books; in 1831 to 1832, 1,032*l.*; 1832 to 1833, 1,359*l.*; 1833 to 1834, 1,974*l.*; 1834 to 1835, 1,970*l.* That makes altogether 7,399*l.* But duplicates were sold for 2,043*l.*, and others given to the Royal Society for 450*l.* more. So that Parliament actually spent during those five years 4,905*l.* on the library of printed books, that is not so much as 1,000*l.* a year, when the liberality was carried farther than it was ever dreamt of before. During the same period 7,397*l.* were spent on manuscripts, and moreover this year the manuscripts are to have an extra grant of 2,000*l.*, besides the usual annual grant. The antiquities during the same period have had 9,831*l.*, and then the prints have had 926*l.*; that makes 9,957*l.* Then they have got an extra grant last year, 2,500*l.* for Egyptian collections; and they are going to have 8,000*l.* more for Dutch prints and Etruscan vases. That makes more than 20,000*l.* The natural history have had within 8*l.* or 10*l.* as little as the printed books; but then they are to have an extra grant of 1,500*l.* Thus extra grants and assistance are given to every department except the printed books, and that is the real truth.

4791. Mr. *R. Colborne.*] Does not this comparison that you have made show that in the general management of the British Museum there is great liberality?—I have nothing to say to that; I confine myself to the liberality to printed books.

4792. In addition to the collection, would you recommend that the Trustees should purchase libraries, or only individual books or particular works as they come into the market?—Libraries, because if you go on book by book you will never end.

4793. And then sell the duplicates?—No; never sell a duplicate; that has been a great misfortune; a very great misfortune.

4794. Lord *Stanley*.] You have spoken of the comparative value of the British Museum library with regard to rare books only: what is the proportion as it regards the utility of the books compared with foreign libraries?—I think, considering the British Museum to be a national library for research, its utility increases in proportion with the very rare and costly books in preference to modern books; such books as you do not look for either in private collections (except very splendid ones), or not ready to be purchased by individuals whenever they want them. I think that scholars have a right to look for these expensive works to the government of the country. You do not so much want such common books as might be had at any circulating library. The library of Göttingen, referred to as a pattern, is an university library; it is a library for the education of the persons attending the university, and not a national collection, like that of the British Museum. It is not a library for research, as ours ought to be, but a library for education; they ought not, therefore, to be conducted on the same principles. Yet even at Göttingen they buy rarities, as far as their means and as far as their principal object (education) allow them. They have a numerous collection of Aldines, and also many books printed before 1500, of which they think even of printing a catalogue. These are rarities; and I have no doubt that if an Aldine, wanting in their series, was offered, the librarians would very properly give a good sum to secure it. English books are exceedingly dear, yet they buy a great many of them, not so much on account of their particular merit, but because they are expensive. The professors complain sometimes of the librarians that they do not buy common books, as this would save them the expense of buying them themselves; but the librarians do not mind such complaints, and they are perfectly right. The fact is, that the library of the British Museum being the only library for a million and a half of inhabitants, will never be satisfactory to every body, whatever be the expense and care taken to please the public, so long as it is the only one in London. There ought to be at least two public libraries for education, and they ought to be formed on very different principles from those of the library of the British Museum. The principle of collecting useful books for common use ought to prevail in them to a certain extent, for the same reason that it prevails at Göttingen. But this is no reason why the same principle should be adopted in the British Museum. I should be very sorry to see only common and cheap editions there. If the poor student, who does not happen to be connected with a great collector, cannot consult costly books there, how can he see them at all?

4795. Then the Committee are to understand that, in your judgment, it is a very secondary object to keep up the library of the Museum, even if it could be done, with a full supply of all the modern British and foreign works?—I would not say a very secondary object; but if I am to choose, I would say that it is of less importance for the library of the British Museum to have common modern books, than to have rare, ephemeral, voluminous and costly publications, which cannot be found anywhere else, by persons not having access to great private collections. I want a poor student to have the same means of indulging his learned curiosity, of following his rational pursuits, of consulting the same authorities, of fathoming the most intricate inquiry, as the richest man in the kingdom, as far as books go, and I contend that Government is bound to give him the most liberal and unlimited assistance in this respect. I want the library of the British Museum to have books of both descriptions; I want an extra grant for those rare and costly books which we have not, and which cannot be bought but upon opportunities offering themselves. Then the annual grant should be increased for modern books, that is books printed from about the beginning of last century. When Napoleon went to visit the King's library at Paris, which was then the *beau idéal* of a public library, and which had been got together by the unlawful means of which I have been speaking, Mr. Van Praet pleaded hard poverty, and he asked a grant of at least 40,000 *l.* to render the library complete. Napoleon said he should have it, and he actually ordered 5,000 *l.* to be paid on account; the political events which followed stopped the payment of the remainder. Now when you have given three times as much (say 100,000 *l.* in 10 or 12 years), then you will begin to have a library worthy of the British nation, but not if you continue to go on as hitherto.

4796. You, like every other of the officers of the British Museum, have shown a very

A. Panizzi, Esq.

7 June 1836.

a very laudable desire to promote the interests of the department with which you are connected. As you complain of the small amount that has been voted annually, what amount would you desire to see voted by Parliament for the purpose of seeing your views carried into effect?—First of all I should think it necessary to have a large extra grant to buy books and libraries occasionally whenever they offer themselves.

4797. What do you mean by a large extra grant?—If you grant during 10 successive years, 10,000 *l* a year, that would be something; and then the annual ordinary grant ought to be raised for modern books, from 2,000*l*. to 3,000*l*. a year besides.

4798. That you consider essential for the purpose of putting the library in such a condition as you would desire to see it in?—I should think the very least that could be done for London; I do not know why Paris should have, in its great library only, above three-fifths more books than London has in its only public collection; nor can I understand why the nation should be surpassed by the French in generosity in this respect.

4799. When you have got this additional money, you would require additional space for the library?—Yes.

4800. In what manner would you provide that extra space within the British Museum?—I think that the chief evil of the British Museum is to have too many things together. When it was established, it consisted of three departments, natural history, manuscripts, and printed books. Natural history was then in its infancy; calves with two heads and such things were considered fit to be collected for public instruction and amusement. In later times the department of antiquities has been added. When the British Museum was founded, a public library of printed books amounting to 200,000 volumes, was unknown. The Vienna library in 1789, which was then the largest in the world, consisted of 196,000 volumes. The Bibliothèque du Roi at Paris in 1791, was counted by Mr. Van Praet, and it contained 153,000 volumes; so that even at so late a period, there was no library known containing so much as 200,000 volumes. Now the library is increased beyond this number, and must increase a great deal more to be worthy of the British nation. Natural history has sprung up in a wonderful way during the last 50 years; antiquities have been collected from Athens and other parts of Greece, and placed there; and thus the single institution of the British Museum is now to answer the purposes of the Bibliothèque du Roi, Gallerie du Louvre, Musée d' Histoire Naturelle, and I do not know what else; in fact, every thing; though these are, in Paris, all different institutions more liberally supported than this single one is here. It is not fair to expect that we can go on at all till an alteration takes place. The department of natural history ought to have better assistance and be transferred somewhere else; in which case there would be room enough for books even immediately. I wish to impress upon the Committee the absolute necessity of this separation; no good can ever be done without it.

4801. In short, for the accomplishment of your views, you would desire first an annual grant to the amount of more than 12,000 *l*. a year for the library; next the institution of two or more libraries for the use of the public, with somewhat different views, in London; and thirdly, the removal from the British Museum of the Natural History department, for the purpose of affording extra space for the increased library?—Not only space, but the extra assistance which is requisite. The officers of the Natural History department justly complain that they cannot get enough; and we, with still greater justice, complain that we cannot get enough; and as long as we are together we are likely to get no more, and neither department will thrive. The establishment has become so great, that I believe it cannot be well governed so long as so many collections remain in the same locality. As for what I suggest besides, I cannot see how we can do with less. If something had been done for our library ere this, so much would not be required now; and if something decisive be not done now, the evils will become tenfold. It is not a bit-by-bit assistance we want; the public have a right to expect something worthy of the nation, and I trust that this Committee will see the absolute necessity of recommending something like what I have had the honour to suggest, and not less.

4802. What do you think of the suggestion that has been thrown out, that the affairs of the Museum should be managed by a committee consisting of the principal officers at the head of each department, who should meet together and settle their

their differences?—I should not think that to be a good plan; but I think all the officers, not the principal officers only, ought to be more consulted than they are now.

4803. What has been the annual increase of volumes in the book department the last few years?—Altogether I think between 4,000 and 5,000 volumes.

4804. What is the space at present allotted to the library?—The ground floor of Montague-house, three rooms in the basement, four rooms on the first floor, and part of the reading-rooms. I do not include the King's library. It becomes daily more and more difficult to put up books; I think Mr. Baber has very great difficulty indeed in finding room; and he has told me that if a library were to be bequeathed of 8,000 or 9,000 volumes to be kept together there would be no room to place it.

4805. Are you including the room which is prepared in the new building?—I was speaking of the old.

4806. What will be the effect of the addition of the part of the new buildings which are to be appropriated to the printed books?—I understood from Mr. Baber that what is intended to be so appropriated in the north side of the quadrangle, is to contain only 20,000 volumes more than the old library contains now. If that be the case, of course no addition can be made, because in four or five years the regular influx of books, even going on very slowly, as we have done hitherto, will just fill up that space; and if you begin building now, that building cannot be ready much before that time, consequently you must put a stop to buying books and increasing the library for four or five years; and the public will have to wait for not only that time, but further, till the books are bought, and then till they are put in order; so that the delay will not be one of three or four years, but of 10 or 12.

4807. You are not comparing the facilities of arranging and putting up books in the new library and in the old library?—No.

4808. In the old building it is exceedingly inconvenient, is it not?—It is inconvenient to find room; books cannot be kept so well together as Mr. Baber would wish; he is obliged to put them where he has room.

4809. Mr. *R. Colborne.*] Can you mention any particular instances of the Trustees declining to make important purchases that were suggested to them?—Yes; I can mention instances even of single books that they have refused to purchase.

4810. Will you mention it?—One is that of Audubon's work on American birds; I think the case is this. By the Copyright Act we get the letter-press of that work, but we do not get the plates; that is one specimen of the evils inflicted upon us by the Copyright Act, and of its multifarious imperfections. We had the text and not the plates; and the text without the plates is not good for much. The volume of plates was offered, and the Trustees refused buying it. To be sure that was in Mr. Bankes' time, so that things perhaps have changed, but I know that it was the case. Another book offered was an edition of Ariosto, printed in 1532, the last which the poet corrected himself, shortly before his death; consequently, that is the only edition containing the poem according to the author's mind; it is a very rare book, a very costly book. The right hon. Thomas Grenville has a copy on vellum, because he never could get it on paper. Mr. Hanrott had an imperfect copy, but Mr. Heber could never meet with one. The copy offered to the Museum by Messrs. Payne and Foss was the finest I have ever seen; the price asked was 50 *l.*, but I thought they would have given it for 45 *l.*; the Trustees refused buying it; and yet that is the sort of books which they ought to have, because no poor man can afford to buy such a book, and it is not always that book collectors will lend such books, even to those who have the good fortune to be well introduced to them.

4811. Lord *Stanley.*] When was this?—About two or three years ago; those are two instances; I think, moreover, there are libraries which we know exist, and which might be had, but nobody has proposed them to the Trustees, as it is of no use. I thought lately that the opportunity offered of making a good addition to our library; I had the honour to propose that certain steps should be taken to ensure the success of my suggestion; which was, that as there are convents about to be suppressed, or already suppressed, in Spain and Portugal, we should secure some of their libraries. The thing was to be done in a delicate way; I think there must be desirable books there, and I have no doubt there are many that would be easily procured; but nothing was done.

4812. Are you aware what was the ground upon which the Trustees declined to

act upon that occasion?—I am not; I have heard it said that the Trustees wrote a letter to Mr. Baber relating to this matter, but I was never officially acquainted with its contents, which I thought rather strange, the proposal having originated with me.

4813. Are you in possession of any positive information as to there actually being books of this description in the convents in Spain, and to what amount?—That there are books in the convents, and very rare books, there is no doubt whatever. I have no particular information, because the convents have just been dissolved in Spain. As to Portugal, I have seen in the newspapers that they have collected there 390,000 volumes from the libraries of suppressed convents, when nobody dreamt of such a thing in that country. We all know that the Spaniards, just at the time of the great printers, and when the rage for literature was at its height in Italy, became the masters of that country, and imitated the great Italian families in collecting books, patronizing literature, and introducing a taste for it in Spain, chiefly by importing thither the best books they could get from Italy. Spanish noblemen often had books dedicated to them in the time of Charles the Fifth and Philip the Second; and many of those books must have passed into the possession of convents in a variety of ways. Those institutions, at a still earlier period, collected with profusion all the earliest printed books relating not only to theology and law, both civil and ecclesiastical, but to ancient literature. We know that from time to time some extraordinarily rare and costly volumes have been coming out of Spain; they have been smuggled away, I do not precisely know how, and many have found their way into the British Museum itself, and are now there.

4814. Was any information actually laid before the Trustees as to the existence of any works which were obtainable by them?—There was no information laid before them; but I thought the Trustees might have collected it if any more were necessary.

4815. Should you say that the present state of Spain afforded great security for persons to make purchases, and to take them away safely if they should be enabled to find such books?—Yes, I should think so, provided persons knew how to do it. I suppose commerce goes on in Spain, and the books would come by the same means as wines and wool.

4816. What the Trustees declined was not the purchase of any works which they were invited to purchase, but they declined to send a rambling commission into Spain for the purpose of hunting out books which might be found in various parts, taking the risk of bringing them away?—I do not know what were the grounds.

4817. Was not that in fact the proposal?—No; it was plain, first of all, that desirable books must be there. It was not a rambling commission. If I hear that the sluices in the Netherlands are open, I am sure that water must be about; and if I want that water I go and fetch it. At the utmost it was running the risk of spending 100 *l.*; but before even spending anything they might have written privately to the ambassador at Madrid, to know whether there were books to be had safely and at a reasonable price; and for aught I know they may have done it; and that is only the postage of a letter.

4818. Of course such a good purchaser as the English Government coming into the market in the present state of Spain would have materially raised the price of anything which they might have wished to purchase, and perhaps have defeated their object?—Probably so; but they need not tell them that they came from the English government: that might have been managed, and it was one of the points about which I myself suggested how important it was to act cautiously. But there are other libraries that might be purchased; there is a library at Florence, of which a catalogue has been sent to the Museum and laid before the Trustees more than two years ago, and a fine collection it is. I never heard that anything has been done to secure it.

4819. Mr. *R. Colborne.*] You have alluded to a copy of Ariosto and some other work. Are you confident that the proposal was brought before the Trustees, and that the subject was taken into consideration?—Certainly; I know that the two books were sent in, and we had an answer from Mr. Forshall on both cases that the purchase was declined.

4820. You do not know the reasons why they were declined?—No.

4821. Do you think there have been other instances of what you would call a similar want of zeal or activity on the part of the Trustees?—I know very little about

about it: Mr. Baber knows about the books that have been proposed, and which they have refused to buy.

4822. Lord *Stanley.*] In your judgment was that copy of Ariosto worth the price asked for it?—Yes, it was sold for 50 pounds or guineas the day after to Lord Vernon; and it would fetch that price now.

4823. In making general additions to the Museum, what mode would you recommend? Would you recommend the purchase of individual books as they might be desired, or the purchase of collections in large masses?—Collections; because we never end if we go on with individual books; the sort of books we are speaking about not being modern books, one must buy them when the opportunity offers, and you must buy collections to secure them. But I would not let any opportunity escape of increasing the library even by the purchase of individual volumes; the library is so poor that we ought to increase it by all means in our power.

4824. For the purchase of collections in that manner you would of course require very large grants occasionally?—Yes. If such an extraordinary grant as I mentioned before of 10,000 *l.* a year for 10 years was invested in the Trustees to be so spent in that way, perhaps one year they would not spend the whole, and another year they might spend for two years together.

4825. You mentioned a collection at Florence; can you form any estimate what the purchase of that collection would have cost?—I have no idea.

4826. Would you have recommended the purchase of that collection as a whole?—Yes, decidedly; and if it is to be purchased now I would recommend it.

4827. You have stated that you would desire that the Trustees should have a sum amounting to 12,000 *l.* anuually, which they might expend more or less in each separate year. Would you think it very desirable that previous to a purchase being made application should not be made to Parliament for the precise sum required for that purchase?—I should think not. Now persons do not offer books because they know we have no money. If it were known that the British Museum have the means of buying either rare books or collections, they would be offered. Lately, when I was at Paris, I was told the Bibliothèque du Roi was going to buy the Catholicon, the second edition, on vellum, which is a very rare book. I said I was very glad; it was immediately added: it is from Germany; and I said no more. The officers of the King's library met, and afterwards I learned they had determined upon buying the book for 2,000 francs. I came home and I went to Messrs. Payne & Foss's shop, and I told them as a novelty that there was this book in the market, and that it was bought by the French library: they said "here is the book." I had been told at Paris that it was from Germany; but the book was in England, and it was never offered to the British Museum, because it was well known it was of no use to make such an offer to us.

4828. In order to carry your object into effect, it would be important not only that a large grant should be made, but that it should not be made at the moment when the books were required?—No; very often collections or books are offered when Parliament is not sitting, and there are sometimes many difficulties in getting grants; if we had that money, of course proper measures should be taken to see that it is spent in a proper way.

4829. Have you any reason to suppose, that if a sum such as you have mentioned were appropriated to the service of the Printed Book department, there would be any negligence on the part of the Trustees in availing themselves of it to its full extent?—No, I hope not.

4830. With the space that has been allotted at present to the library, would it have been possible to augment the library much more rapidly than it has been done?—Certainly not, without the new building, because there is not much room left in the old.

4831. The space is already completely full?—Not completely full, but certainly the increase could not have gone much further.

4832. With regard to catalogues, you are acquainted with several of the foreign libraries; what has generally been the system pursued by them with regard to catalogues, either alphabetical or classed, and in what state are their catalogues?—That is a very important and very comprehensive question; it is the most important question that can be raised connected with a library, and I will try and answer it as well as I can. I have found in general that, in the first place, an attempt has always been made to have an alphabetical catalogue, an inventory of the books, to know what the library contains. Then also attempts have been made, and

A. Panizzi, Esq.

7 June 1836.

in one case with which I am acquainted, that is at Göttingen, more successfully than anywhere else, to have what is called a classed catalogue; I mean successfully as far as such a thing can be successfully done; but I find, except at Göttingen, that the theory of having good catalogues is much more general than the practice; that everybody speaks about them, but very few have even alphabetical catalogues.

4833. When you speak of alphabetical catalogues, in what sense do you understand it?—I take it to be a list of the books. You must enter the works according to the names of authors, and in the case of anonymous publications, or in the case of transactions of societies, journals, &c. under certain fixed heads, without reference to the subject on which the books are written, but only with reference to the authors, so as to put their names in the list.

4834. In an alphabetical catologue, how full would you require the notice to be of each work; in other words, how much fuller would you make it than a mere index?—The distinction is very great; an index or inventory, or what is generally called a catalogue for sale, requires only to have the name of the author and one word or two to indicate what the work is. Now taking, for instance, the book which happens to stand first in the alphabetical catalogues in the British Museum, both in the King's Library and the Old Library, Abelard's works, in one case it says, "Opera ejus et Heloisæ Abbatissæ conjugis ipsius;" in the other case it says, "Opera," with a preface by so and so, edited by so and so, and containing so and so. I think the saying merely "Opera," is what is generally done in indexes or inventories, or what are called catalogues for sale. I think the other is nearer (but not entirely) the system according to which a good alphabetical catalogue should be made, which ought to convey not only all the information which is on the title-page, and which often may be very scanty, but it ought to state what is the commentator's name, editor's name, or translator's name (if it be a translation), and what has been added to the book by them, whether this information is to be found in the titles or not; if there be any peculiarity in its condition, such, for instance, as containing any other work or works in addition, or as an appendix, that too ought to be noticed. Whatever may interest the bibliographer and literary historian as peculiar in the volume, should not be passed over in silence; these and many other things are required to constitute a good alphabetical catalogue. It is impossible to enter into all details. I know but one good one, which is a pattern of what an alphabetical catalogue ought to be, and that is the catalogue of the Casanate library at Rome, by Audiffredi, who unfortunately died, and the four volumes printed go only to the letter L.

4835. This being your definition of an alphabetical catalogue, can you inform the Committee what is the state of the principal libraries of Europe with reference to the formation of catalogues?—I think at Gottingen it is very good; it might be done and ought to be done much better, but it is good.

4836. Is there any such catalogue at Paris?—No. First of all, the basis of their catalogue is not alphabetical; they carry on a classed catalogue as much as they can, and it is defective to such a degree, that they have not a tolerable catalogue of one-fourth of the library. They have besides some 400,000 titles in slips, on several plans, which they were thinking of rendering available some way or other. It is impossible to do more than they do, but they never will be able to do any permanent real good till the whole system is remodelled, and the catalogues re-made altogether.

4837. There has been no want of liberality in Paris for the increase of the library?—No, between what they bought and what they stole.

4838. A classed catalogue of a library of that extent has not been found practicable or worth while to carry on?—No. It is impossible, in my opinion, to complete the one at Paris whatever be the number of hands put upon it. The system is bad.

4839. What is there at Vienna?—They say they have an alphabetical catalogue; but it is not complete, as I know from persons who have seen it. I think it is not good; but I cannot trust my memory as to the state in which it is; but I would be happy to hand in a copy of the questions which I put myself, and of the answers returned. The Committee may have an idea of the questions I put, as by chance some of the answers have been printed in the Parliamentary Papers, from Vienna itself, as well as from the Hague and Leyden. I never could get an answer to my questions from the last two places; but some way or other those questions have been sent to the Government here with their answers, as if they had been questions sent by our Government to obtain information about foreign libraries.

Those questions are my questions, and those answers are the answers that were to come to me; instead of coming to me, they have been printed about a fortnight ago for the use of this Committee.

4840. From the information that you have, are there any foreign libraries which you consider to have a satisfactory catalogue, either classed or alphabetical?—Not so far as I know.

4841. Do you think that the Göttingen is the best?—The best; but I am not satisfied with that. It does not come up to my notion of perfection, not abstractly speaking, but such as I think can be executed, and such as was, in fact, executed respecting an alphabetical catalogue by Audiffredi.

4842. What is the number of volumes at Göttingen?—200,000 and 300,000 articles.

4843. Is that catalogue alphabetical or classed?—Both.

4844. What time did the formation of that catalogue occupy?—I cannot say; the catalogues were begun by Heyne in 1777, and all the arrears got rid of in about 10 years; but what was the number of titles then I do not know. The volumes are said to have been 60,000 in 1763; nor do I know what assistance Heyne had; I have, however, heard that the expense was considerable, so that the assistance must have been in proportion.

4845. When was it completed?—It can never be completed; it is going on as the library increases; but it is very nearly kept up. Not long since they began excluding from the alphabetical catalogue all the Theses which are defended in the universities, according to the system on the continent, by persons who wish to take academical honours. They found that these titles increased so much the bulk of the catalogue that they determined on excluding them from the alphabetical catalogue, and they can do it in this way. The universities of Germany, the Dutch universities, the Swedish universities, and, I believe, the Danish universities have acceded to a kind of treaty. They have agreed to exchange among themselves all the Theses. The university of Göttingen send theirs to others, and in return all the others send theirs to them. They bind them up together in one volume, and say, for example, Theses of the university of Berlin, for the year 1833; they do not enter them at all in the catalogue; they are put up in volumes; and when any one wants to know anything about the contents of these Theses, he has only to go and ascertain when the Thesis was defended, and he will find in the collection of that year what he wants. But the alphabetical catalogue does not help him there. I think also the transactions of societies are not entered in the alphabetical catalogue. They have found that it was a very difficult matter to catalogue them. I thought the geographical order would be the best on the whole. One of the librarians, who had the kindness to enter into the subject, agreed with me, but said they had not settled that principle; and that proves that they had not entered them in the alphabetical catalogue.

4846. Of course the time, the labour, and the expense of making an alphabetical catalogue as you describe would be greatly increased in proportion to the antiquity and rarity of the works?—Certainly; for instance, generally you find the early printed books have no title-page, and very often there are many things collected together and printed as one work. Often the date is wanting, as well as the place where the book was printed, and to ascertain it takes much time. A book may take a day and more to catalogue it as it ought to be catalogued in a national library.

4847. A great increase of anonymous and pseudonymous works would also increase the labour?—Of course no time and trouble should be spared to find out the names of authors who so concealed themselves.

4848. Then as the British Museum contains a large number of rare and ancient works, and of anonymous and pseudonymous works, you are not to estimate the expense or the time that will be occupied in making a catalogue merely according to the number of volumes, but according to the difficulty of the thing?—Yes; 20,000 volumes of common books may take one year, and the same number of rare books may take three or four years, and even more.

4849. And even with reference to the number of volumes, do you consider that the labour of making an alphabetical catalogue increases only in arithmetical proportion?—No.

4850. For example, a library of 240,000 volumes will take much more than three times the time that would be occupied by one of 80,000 volumes?—Decidedly so; the more it grows larger the more you have those researches extending; you have the same thing coming over again, and you do not always

A. Panizzi, Esq.

7 June 1836.

recollect what you have already done, and are obliged to find out the same information over again. Take, for instance, a book without date and printer's name; you have seen that type before, or you imagine that you have seen the type before, but you do not know where. To find that out is a matter of great trouble in a large library. The same thing does not happen in a small collection. Much more might be said on the subject.

4851. Supposing every thing was to be begun *de novo*, and that you had no materials to work upon, can you estimate the time and expense which would be occupied by an alphabetical catalogue of the works of the British Museum, to be done in such manner as you would consider creditable to a national establishment? —I do not think I can at this moment; but this point has been a matter of consideration with the officers, and at one time the Trustees, about two years ago, directed Mr. Baber to give in a plan for an alphabetical catalogue. Mr. Baber thought the thing so important that he liked better to have the opinion of Mr. Cary and myself. We arranged this way. Each of us drew up a plan; then we met in Mr. Baber's room, and we each read what we had written. Of course in four-fifths of that plan we all agreed; there were a few things in which we did not agree; then we discussed them, and one gave up his opinion one way, and another another, or he got satisfied, and finally Mr. Baber drew up a plan, which he sent to the Trustees, in which we all concurred, and which, in my humble opinion, is as good a plan for an alphabetical catalogue as could be made; and if the Committee will call for that paper (I suppose there is no objection on the part of the Trustees to produce it), they will see that the officers did what they could, and suggested what they thought right.

4852. Do you consider it right that an alphabetical catalogue should take precedence of a classed catalogue?—No doubt of it.

4853. You consider that to be of essential importance?—Certainly.

4854. Are you of opinion that it is desirable or practicable to carry on the operations of making an alphabetical catalogue and a classed catalogue at the same time and under the same superintendence?—I think there are great difficulties; it might be done, but not so well and not under the same superintendence altogether. I understand the question to refer to drawing up the two catalogues of arrears, not to keeping them up afterwards.

4855. Supposing you had the entire control and management of making a catalogue for the British Museum, which should include an alphabetical catalogue and a classed catalogue, and that the option were given to you, both with reference to the speed and to the manner in which it would be effected, either of beginning with one in the first instance, and from that forming the other, or of undertaking the two, and carrying on the two simultaneously, which course would you adopt? —I would first make the alphabetical catalogue; but I must say, candidly, that I have a great objection to what are called classed catalogues. I think it is impossible to make a good one; I never heard of any. I never heard of two men agreeing on the plan of a classed catalogue. The greatest men of all countries have all talked about classed catalogues as a matter of theory. If you look at the plan of the St. Petersburg library, it looks one of the finest things that can be seen. Dr. Olinthus Gregory (who has said that he never knew anything practically about a library) has given you a plan in which he has only forgotten the vegetable kingdom altogether; but however there is his plan. The British Museum has a plan, Mr. Horne's plan, which is one of the best I have seen. The worst of all is the plan I have been obliged to adopt for the Royal Society of London, which will beat anything for absurdity. Scientific men have obliged me to adopt a plan which does not deserve the name of a plan of a classed catalogue. So that people must first of all agree on what is a classed catalogue. As to science particularly, it is impossible to have classed catalogues scientifically made at present. For scientific purposes particularly, classed catalogues 40 or 50 years old, on a scientific plan, cannot possibly be now of use, because the changes which have taken place in mineralogy, in botany, and in all natural sciences are such that you must be reclassing every day. Take chemistry from the time of Boerhaave: it was the system of Boerhaave which prevailed when Heyne began the Göttingen classed catalogue. Then Lavoisier made a revolution in that science; then, after the French school, Davy, Dalton and Berzelius have made another; and Volta discovered, or rather caused immense progress to be made in galvanism; magnetism is now successfully investigated, and who knows what further changes it may produce in this same class, chemistry? As soon as a classed catalogue of chemical

chemical books is completed, you must begin a new one, to keep pace with the progress of the sciences. Not one of those who speak of a classed catalogue, scientifically arranged, if they would honestly confess it, ever used one. The first thing they used was an index of authors at the end of such a catalogue. If you take the best classed catalogue of this sort that has almost ever been made, Dryander's catalogue of Sir Joseph Banks's collection, I challenge anybody, but a very clever botanist or a very clever mineralogist or zoologist, to use it. It is not made for the student; a man that is already a very good botanist, or mineralogist, or zoologist will consult it, but a man that does not know thoroughly those sciences is bewildered; he will use the list of the names at the end, and from that go to the classes.

4856. Then you are clear in your judgment, having had considerable experience and acquaintance with the different libraries of Europe, that an alphabetical catalogue is infinitely more important, as a primary object, than a classed catalogue?—Yes.

4857. You think, therefore, that the labours of the establishment of the British Museum ought to be directed first to a good alphabetical catalogue?—Certainly.

4858. Supposing that the principle of a classed catalogue were agreed upon, what proportion of the labour would afterwards have to be encountered in classing, after you had an alphabetical catalogue?—If the slips be well written, it would not require much alteration to class them; but I have a great objection to classed catalogues. The thing which is requisite is a good index of matters to an alphabetical catalogue. An index of matters to an alphabetical catalogue is a much more useful thing than a classed catalogue; it is more easily done, and it can be carried on at the same time with the alphabetical catalogue; because when you have, say 50,000 or 60,000 titles already catalogued, there is no objection to begin indexing those. If, however, people insist upon having a classed catalogue, they may have it afterwards; even that may be of some use, but of comparatively little use after an alphabetical catalogue and a good index of subjects to it. I stated all these reasons in a privately printed report to the council of the Royal Society of London, when I tried to make them give up that absurd plan of theirs. I am sure they never understood what I meant by such an index. They would have their classed catalogue, in which pneumatics and chemistry are in the same class, and canal navigation with astronomy together in another. This is their scientific arrangement and classification.

4859. This is a catalogue which you are at present engaged in carrying into effect under the scientific directors of the Royal Society?—Yes, unfortunately for me.

4860. Will you state to the Committee what have been the recent steps taken by the Trustees of the British Museum with regard to the catalogue?—After Mr. Baber had given in the plan which I mentioned before, for some reason unknown to us, the officers of the library of printed books, it was not adopted, and another plan was substituted, something like it, the Trustees said; but I do not think it was like it at all, and at the time I thought it was wrong. I had occasion to speak to a Trustee about it, and he asked me whether I would state my objections to the Trustees themselves, and I said yes. When they met I was called in, and stated my reasons for objecting, and then I went out of the room. I heard they were going to embody in the minutes what I had said. I said to Mr. Forshall, that I knew better myself what I meant to say, and that I would write to him a note. I did so, pointing out what appeared to me to be the serious inconveniences attached to the plan adopted by the Trustees instead of Mr. Baber's plan. However, their resolution was adhered to. Lately, when I was in Germany, I heard that they had asked Mr. Baber for a plan once more, and I understand he has sent one in; but at the same time he suggested whether it would not be better to ask the opinion of all the officers of the department. This was done; and then I sent in a report, stating what I thought in general about catalogues of all sorts, and entered upon the whole question. In this paper there is everything that I can say upon the subject, and I beg to refer the Committee to it, and shall be happy to give any further explanation if it be produced.

4861. At the present moment it is the intention of the Trustees, is it not, to have an alphabetical catalogue completed before a classed catalogue is attempted?—I suppose so; but I do not know what their intention is.

4862. Upon what are the officers of the department now employed?—Now we are doing another thing. The readers complained much of the old catalogue, and

A. Panizzi, Esq.

7 June 1836.

they were right, particularly on two accounts; first, by being interleaved and printed on one side, the printing being so much closer than the interleaved part, the alphabetical order was attended to at first, but the transcribers could not keep pace on the interleaved part with the printed part, and the entries got out of alphabetical order: the other was, that it was worn and torn in several parts by use. Mr. Baber suggested to have a copy of it fairly made out, with plenty of room for additions, and the alphabetical order preserved, by putting a very valuable person we have (Mr. Grabham) to look over it, and to set it right whenever it was out of the alphabet. This was approved of by the Trustees, and it was ordered to be done with a further view that in a year or two, when the new library is ready, the references to the new places be added in a column left for the purpose, so that the reading-room should not be interfered with, but that the changing of the library from the old to the new building should go on at the same time, and the new references put on the catalogue at the moment that the books were placed in their new presses, so as to have all in order at all times. When the question was mentioned again about an alphabetical catalogue, the Trustees had the kindness to ask my opinion: I said that I was for a good alphabetical catalogue, and I mentioned as a pattern the Casanate catalogue, and that by Hyde of the Bodleian, which is not, however, so good as the former; that, I said, would take a great deal of time to do. Then they asked what could be done now to stop the complaints against the old catalogue; I suggested that this new transcript should be copied again, and this second copy on smaller paper, for the convenience of the readers, should be put in the reading-room, and that that ought to satisfy the readers for some time; and then during the use of that catalogue a new one should be made on a plan worthy of our institution. The Trustees approved of this suggestion, and they ordered immediately that the transcript should be continued, and that a new transcript should be made for the reading-room. But before transcribing it the second time, it is necessary to read the first transcript, to correct the most important errors in the original old catalogue, and next to correct the clerical errors in the copies themselves. This I was particularly directed to do; but as that operation takes much time, I said to the Trustees that that would *pro tanto* retard the sending into the reading-room the new copy. However that is a thing which is done now as well as we can.

4863. Then the operation which is going on now, is not only an additional convenience afforded in a very short time to the reader, but at the same time the operation of correcting and revising the catalogue is going on?—To a certain extent. If we were to enter into the general correction it would take more time than it would be necessary to give to it; it would be tantamount to a remaking of that catalogue. It is to be considered a provisional thing, but certainly very good in comparison, and as much as can be done for the readers under present circumstances. We are aware of the deficiencies; but the readers must consider that this is the only institution in Europe in which they have catalogues at hand; in all other places the catalogues are kept by the librarians, and it is a matter of favour to have them; sometimes they are denied. At Göttingen, for instance, it is a favour which the librarians grant to let you see the catalogue, but here it is a matter of right; people go into the reading-room and look out for a book, and they ask for it, and it is brought to them; if not, a reason must be assigned. As they have this immense advantage, they must have a little patience till we can make a better catalogue, but there is no possibility of doing more now.

4864. Can you state what number of titles can be upon an average gone through in a day in forming an alphabetical catalogue?—Fifty or 60 in six hours; I thought 60 or 70, but I have learnt at the Royal Society, where I worked by the number of titles, that I could scarcely do 50 in five hours, on an average.

4865. Mr. *Hawes.*] What assistance had you?—None whatever.

4866. Lord *Sandon.*] Those are full titles?—Yes; done as well as I can according to my contract, and much better than the society deserve; but not so well as I should wish the catalogue of the Museum to be compiled.

4867. Lord *Stanley.*] Had you any assistance in taking down the books?—Yes, I had manual assistance.

4868. If you are to go through every title, making the comparison yourself, what assistance could be afforded you beyond that of taking down the books?—In that report of Mr. Baber's, that very subject has been considered. It was suggested that one of the great evils of an alphabetical catalogue is the want of consistency in many things: in one case to give information in full; in another case, not

to

to give it so full; in one case to enter a book under the title of the person, in another, under his family name; in another case, particularly in the French names, to enter the "Las" and the "Des," which is a most difficult thing, in different ways; I never knew anybody that did it all one way. To obviate these and many more inconsistencies, it was thought necessary to have one person only superintending the work; and it was thought so also, because it was requisite to have somebody clearly responsible, that the Trustees should know on whom to lay their hands, and the public the blame, if the work was not properly executed. For these reasons likewise, it was thought that an officer of the Museum ought to be that responsible person, and not a stranger; because if the officers are not fit to superintend the catalogue better than a stranger, they ought not to be there. It was further considered that three young gentlemen of good education should catalogue the books; a German particularly for the German and northern languages, another gentleman for the classical literature, and another for the languages spoken south of Europe, and English for all; and that then all the titles should be revised by the superintending officer. The work should be carried on in a room where all sit together with the books before them. There is a quantity of titles which would be plain sailing, where there could not be any difficulty; then there would be a title where some uncertainty would exist. That would be considered, and a principle fixed, a kind of precedent established, and that precedent should be strictly adhered to in every case; because it is better, if even in time it should turn out that the precedent is not the best that could be chosen, to stick to it, than to act sometimes one way, sometimes another.

4869. Each of those gentlemen would be able to do about 50 titles a day?—About that number; then the revisor would be able to keep up with them. We thought that the officer could not look over more than the work of three. We also thought that after two or three years, by working together, by becoming more acquainted with their work, and by a great number of precedents being established, possibly a fourth might be added, but that was matter of great doubt.

4870. You said just now that there was no other library in Europe in which the possession of the catalogue by the general reader was a matter of right; that in some it was a matter of favour, and in many it was denied. Generally speaking, is there any public institution where such facilities are given to the public, as in the reading-room of the British Museum?—Certainly not; there is nothing to be compared with it, both for the time during which the library is opened, and for facilities of every kind.

4871. You say that from a knowledge of the practice pursued in other institutions?—Yes, from what I have seen when I have presented myself without being known in foreign libraries, and from friends who have been reading in foreign countries.

4872. Have you heard any complaints in the reading-room of the British Museum?—Yes; there will always be people that complain.

4873. Are the people that make complaints generally people of the best information and the highest class of students?—Certainly not; if the Committee will ask Mr. Hallam (I quote him as being a gentleman well known, who has frequented the reading-room for above 20 years), they will be told there is no just cause of complaint. I understand that Dr. Wiseman, a Catholic gentleman from Rome, very well known, went spontaneously to Mr. Baber and thanked him for the attentions he had received, and he said that our reading-room was the best reading room he ever was in, and I believe it is; we do all we can, but finding fault is a very easy thing, and perfection cannot be expected.

4874. For present information, is there any difficulty in ascertaining both the existence and the place of any work which a reader may desire to consult?—Certainly none, for the place or existence of a work when the reader gives us correctly the title of the book he wants. The system of references as to the locality of the books, is better in the British Museum than in any place I know. As for ascertaining whether in the library there is a particular book on a particular subject, whose author's name is not known, as we have not a classed catalogue or an index of matters, that information cannot be got so well as if we had an index of matters, but it can be easily supplied with a little patience. First of all there are what are called *libraries*, viz. printed catalogues of all books written on special sciences; for instance, mathematics, history, and so on. A gentleman has only to turn to one of these catalogues, and on finding the book that he wants to consult, he refers to our alphabetical catalogue and sees whether

A. Panizzi, Esq.

7 June 1836.

we have it, and if so he gets it immediately. Then there are such general works as Watt's Bibliotheca, which is an alphabetical catalogue with an index of matters, and there is no classing there. Watt is used very much, because it has an index of matters. If it were a classed catalogue, readers in general would leave it alone; but being an alphabetical catalogue with an index, they use it freely, and find the books they want on a given subject, and then they go to the catalogue of the Museum and ask for such as we have. Then again they consult works written on the subject on which they are engaged, and those refer them to others. Finally, the librarians do all they can to give all the information that they have; and we have had many gentlemen who have acknowledged their obligations for our assistance in this respect.

4875. Will you state what improvement has been recently adopted in the new transcript with regard to reference?—In the catalogue of the British Museum, the one which we keep for the use of the library, there are certain references given, or symbols, to know exactly where to find a book. In the reading-room catalogue those symbols were not put; I thought, and Mr. Baber thought also, that it would be an evident improvement to have in the catalogue for the reading-room the same references as in the catalogue of the library, because the reader would have only to copy the title of the book as well as the reference, and instead of his ticket going to one of our men, who is obliged to look over the catalogue inside to put the reference, the attendant would go direct with that ticket to the place where the book is, and carry it to the reading-room immediately. It would be an economy of time for the readers, consequently an economy of time for our men, and consequently a saving of expense in the number of men. But there are other advantages attending this system. Often the readers come to ask for a book which was never printed, or which, if printed, is not in the library, or they write down the title as they have seen it elsewhere, not correctly quoted, and give it to one of the attendants. The attendant begins to look over all the catalogues, and cannot find the book; he is afraid of being in the wrong; he loses a great deal of time, and the consequence is that all the readers who have written correct tickets are kept waiting by the fault of him who has written an incorrect one. By the new system, a person will be obliged to look in the catalogue in order to put down the reference; he will therefore ascertain whether we have the book or not, and not give us useless trouble, and to the injury of other readers. Having given that reference, if it be wrong it may be wrong, because it is incorrectly put, and then we must answer for it; but if it be the fault of the reader, although I could find the book, I would, on principle, return the ticket, because all the other readers are inconvenienced by the carelessness of this one, and the returning the ticket would be the best mode of ensuring attention. By this means we shall save much time and remove much of the inconvenience now complained of by the readers.

4876. Can you state what the average number of books asked for in the course of a day is?—I believe about 500.

4877. Lord *Sandon.*] Do you happen to be in possession of any information as to the number of readers in any foreign library?—Yes, it is one of the questions I have put, and to which I have received an answer from several quarters.

4878. And the number of volumes asked for in the course of a day?—Yes; these are the questions (*producing the same*).

4879. Have you compared the questions you put with those that were put by the order of the Committee through the Government?—I confined myself to printed books; I asked for nothing else; and my questions are quite a different sort of thing.

4880. Then by means of the answers to these questions you have quite different information to communicate to the Committee from that which has been furnished through the means of the government?—Certainly.

4881. Mr. *Hawes.*] You have stated that from time to time various offers have been made to the Trustees of libraries or of rare and scarce books, and that sometimes they have been refused. In the case of an offer being made or a refusal taking place, is it the custom of the Trustees to consult the principal officers or the assistant officers of the Museum?—Never the assistant librarians; they sometimes consult the keeper. In plain words, in my department they will consult Mr. Baber, but never Mr. Cary or myself.

4882. According to the practice of the Trustees of the British Museum, would Mr. Baber be consulted by the Trustees in the event of an offer being made?—I suppose he would.

4883. Do you know it to be the practice of the Museum?—I suppose they would consult him; but there has never been a case in which they have bought anything. Whatever has been bought has been bought by Mr. Baber, under the general custom prevailing that the head of that department buys according to his discretion; and as they know they can trust to him, they let him go on; but I do not think there has ever been a case of a library being offered and the Trustees referring to Mr. Baber or any one else, because they have never treated for anything.

4884. Then it is not the practice of the Trustees to consult the officers of the Museum in reference to the purchase of libraries, should any be offered?—I do not know that the case has ever happened. I hope they would consult Mr. Baber; but I am certain they would not consult the assistant librarians.

4885. In the case you mentioned of an edition of Ariosto being offered, was any officer of the Museum within your knowledge consulted?—The Trustees did not consult us; but we volunteered our opinion in this way: I found this book at Messrs. Payne & Foss's by chance, and I said it ought to be in the Museum. At my request they sent it to Mr. Baber, and I wrote a note to Mr. Baber, as desired by him, stating the importance of that edition. This note went in with the book itself when it was offered to the Trustees; but it was declined, and so there was an end of it.

4886. Is there that cordial intercourse which is desirable between the Trustees of the Museum and the officers of the Museum with reference to improving the collections of the Museum generally?—I think not; the intercourse is merely official intercourse. With respect to improvements, it is intercourse only with the heads of departments. Whatever there is, is with them; and as to the assistant-officers, it is blind obedience, passive obedience, and nothing else. I speak of the law not of the fact, because, as for myself, I cannot be better than with Mr. Baber. We are on the most intimate terms; he often asks me my opinion, or he tells me his own unreservedly.

4887. Sir *Robert Inglis*.] Without reference to yourself in your own department, would you recommend it as a general principle that other officers than the chief of a department should be officially and directly consulted by the Trustees?—Yes; very often I think it would do a great deal of good.

4888. Might not the recommendation of the assistant be in opposition to the recommendation of the principal?—That would just be the good resulting from it. The principal may be mistaken; we may not agree on some points, and have an opinion of our own. It would be well if the Trustees were to have the two, always leaving with them the decision; only consulting. I would never have the officers to decide; but in their being consulted there cannot be any harm. What I suggested respecting the second transcript of the catalogue was approved of by the Trustees, who were pleased to think that the suggestion, although from an inferior officer, might prove beneficial to the institution.

4889. Have you not constantly found, and have you not reason to believe, that other officers have constantly found a facility of making such representations as they might think necessary; yourself through Mr. Baber, and other gentlemen through the immediate heads of their respective departments?—Indeed I am not aware of that.

4890. Will you be pleased to answer the question so far as you are individually concerned, limiting the question and the answer to the Printed Book department?—I have often made suggestions to Mr. Baber; but I have not seen his reports, nor do I know whether he has given in to the Trustees the suggestion I have made to him. At all events, if he did so, the suggestion came before the Trustees as his own, and he is the judge of the propriety of making it. Our intercourse is a friendly intercourse; I never speak to him as an officer, but I speak to him as Mr. Baber.

4891. But, practically, whether as an officer or as a private friend, you have had an opportunity of making, through Mr. Baber, such representations as you might think desirable for the Trustees?—Not so much as I should wish, because I do not like interfering, and taking upon myself what does not belong to me.

4892. Has Mr. Baber ever given you reason to think that he considered such representations on your part as an interference with his duties?—Never; he is too well-bred for that; but I too, I beg to say, am not so ill-bred as not to know myself that I must not go further than a certain limit before I am reminded that I am exceeding it.

A. Panizzi, Esq.

7 June 1836.

4893. Have you been yourself consulted by the Trustees about a catalogue?—Yes I have, twice; once at my own request, because I thought that what was doing was wrong; and a Trustee had the goodness to move that I should be called in, and the other time, I think, at Mr. Baber's own suggestion; but I was in Germany, and I do not know how that took place.

4894. Mr. *Hawes.*] What were the circumstances attending the refusal of Audubon's work on birds?—I do not know further than what I said before. We had the letter-press belonging to the work; the plates were offered by Mr. Audubon; I think the price was 40*l.*, and Mr. Baber thought, that it being a large sum, he had better not take the responsibility of buying the book upon himself, and submitted the offer to the Trustees. I believe he reported favourably, but the offer was refused, and there was an end of the matter. I do not know why it was refused.

4895. Lord *Stanley.*] Do you know in what state the funds voted for printed books were at that time?—No, I do not; but I think Audubon would have given credit.

4896. Mr. *Hawes.*] You have stated that the library has very much increased of late years, both by way of donations, and under the Copyright Act, and by purchases?—I do not think it has very much increased; I contend it has not increased as it ought to have increased; it has increased at the rate of 4,000 or 5,000 volumes a year.

4897. For what portion of the increase are the Trustees responsible?—I suppose they are responsible for not buying more than they have done.

4898. Over what portion of the actual increase do the Trustees exercise any influence?—I suppose on none except the buying books; what comes by the Copyright Act they cannot make more or less, nor what is given.

4899. Then what portion of the annual increase is obtained by purchase?—Mr. Baber knows that better than myself; mine is only second-hand information.

4900. Sir *Robert Inglis.*] When you state that the Trustees could not aid in the increase of the library in respect to donations, are you aware of the negociation carried on at the time of the intended donation by the late King, of the library of King George the Third, to the nation; a negotiation between some of the Trustees and the late King personally, in order to procure the direction of such donation to the British Museum?—Yes, I have heard of it; and I was going to say that I did not mean they would not exert themselves as much now, if they knew of any donation to be likely to be made to the Museum; but in general they cannot answer for books not being given, which I understood to be the question.

4901. From what you have heard and from what you believe, do you consider that the fact of the King's library being at this moment placed under the roof of the British Museum, is attributable to the exertions made by some of the Trustees?—Yes, I think both Trustees and officers worked very hard to get that library there, and exerted all their influence, both public and private: they did all they could: I am sure they would do the same now.

4902. Mr. *Hawes.*] What benefit do you suppose the British Museum has derived from having high public functionaries, and men of very high rank among the Trustees?—I think very great advantage.

4903. Will you state what?—In this very case of this library, I doubt whether if the Ministers and the Archbishop of Canterbury, the Bishop of London, and other great men, had not been on the trust, they would have got that library. They could not have had the same weight if they had been private individuals. Moreover, many of the Trustees are distinguished for the donations they have made to the place. At present, I remember two, Mr. Payne Knight and Mr. Cracherode, who have made magnificent donations both of them, and they were Trustees.

4904. Was Mr. Cracherode a Trustee?—He was when he lived.

4905. Do you think the Museum has derived all the advantages it might from such distinguished Trustees?—It is very difficult to say what it might.

4906. Looking at the pecuniary grant per annum, and the purchase of books, do you think they are in proportion to the rank and influence of the parties?—No; the purchase of books is not in proportion to anything that I know; either in proportion to the Trustees' rank or the wants of the library, or the means of the nation; but I do not know how you can draw a comparison between the number of books bought and the rank of the Trustees.

4907. Supposing one reason for having men of influence on the trust was their having

having connexion with the Government, may not there be some proportion between the sum expended and the rank and influence of the parties?—I do not know whether we should even have got as much if the Trustees had not been men of high rank. Their defence is, that the Government told them to keep their estimates very low.

4908. Are the institutions of Paris headed by men of established rank?—The institutions of Paris can scarcely be compared with ours. The officers of the King's library at Paris form a board themselves, and they correspond directly with the minister for the home department when there is not a minister for public instruction. It is therefore this minister who stands in the same relation to that establishment as the Trustees stand to ours; and he is a man of high rank, being a minister.

4909. Are the heads of the various libraries of Paris men of rank and influence equal to those at the head of the British Museum?—If the question refer to the officers, officer for officer, I suppose we are equal; I do not know that they are of higher rank.

4910. There are no men of very distinguished rank connected with the royal library at Paris; is not that library as extensive a library as that of the British Museum?—Much more.

4911. Has not that library been formed by the nation without the influence and assistance of men of very high rank?—No; it has been formed, at least one-third, of the libraries of books which they took from convents and from emigrants.

4912. Deducting the whole number that they stole, and looking then at the remainder, and comparing it with the British Museum, is not it then a larger library than this?—Decidedly.

4913. Was the formation of that library at all owing to the influence of men of very high rank?—I should think it was.

4914. As members of the constitution of the library?—A comparison can scarcely be drawn for this reason: we have the Trustees here, who stand in the same relation to the officers as the minister, either for the home department or for public instruction, stands to the officers in the King's library at Paris; now certainly the minister is a man of high rank, if it were from nothing else but his official situation.

4915. But he is not responsible for the regulations and management of the library?—He approves them.

4916. But the immediate executive of the library is vested in the librarians, or in individuals of rank very inferior to that of our Trustees?—It is vested in the officers.

4917. Sir *Philip Egerton.*] Subject to the control of the minister?—Just so.

4918. Mr. *Hawes.*] Did that library grow up under the direction of men of a rank very inferior to that of our Trustees?—Yes, with the assistance however of the minister from time to time; and according to their system of government, it was perhaps the best thing they could do; but with a government like this, and with the aristocratic habits of this nation, and with the two Houses of Parliament, it is not enough to satisfy a minister here; and it is very well if you have Trustees sitting in the House of Commons, who may help you from time to time by stating your case, and putting it clearly before the House, so as to induce them to do what otherwise, perhaps, they would not have done. The same is the case in the House of Peers; it is a good thing to have Trustees there.

4919. You think that a board of officers, composed of the most distinguished men of science and literature, would have less weight with the public and with the ministers than a board of Trustees, composed as the trust of the British Museum is?—It is a very difficult thing to say what the words "men of science" mean; if we take the word "science," as connected with the British Museum, I apprehend that there is but one general branch of knowledge under the name of science, viz. natural history, connected with it. I have heard the names of great mathematicians mentioned in last year's examination; now I apprehend those would be very bad trustees, because they have nothing in common in their pursuits with the objects for which the British Museum was instituted.

4920. Would their recommendations in reference to an increase of the library, or the other wants of the Museum, have less weight with the ministry of the day and the public, than the recommendation of such a trust as now governs the Museum?—It certainly would; and it ought. What do they know about a library beyond mathematical books? They may know from their general information, but

A. Panizzi, Esq.

7 June 1836.

not as mathematicians: on the contrary, they do not like fine arts and literature, as they prove nothing, mathematically speaking.

4921. The question referred to a board composed of the heads of the different departments of the Museum; and supposing them to be first-rate men in their respective departments, would their recommendations have less weight with the ministry of the day and the public than the recommendation of such a trust as now governs the British Museum?—I do not know what weight it would have, but I should not like to see the officers have the whole management themselves: in a country like this I do not know whether it would have more or less weight, but I should think it would have less. If all the officers in the Museum were to recommend a thing, I think their recommendation would not have the weight that a recommendation from the Trustees has.

4922. If men like Mr. Southey or Sir Walter Scott, Mr. Babbage or Mr. Faraday composed the board of officers of the Museum, you think their recommendation with reference to the improvement and augmentation of the collection would have less weight with the public mind than the recommendations of the board of Trustees as now composed?—It is a delicate thing, because you suppose those gentlemen to be officers. The question is, whether Sir Walter Scott and those great men would not be better officers than we are; of course, I dare say they would be.

4923. The question assumed that the board of officers was composed of the first savans and literary men of the day?—The question comes to this, that we are not the best officers that could be chosen, but that the other gentlemen you mentioned should be chosen; it seems to me that it is no longer a question between the Trustees and those great men, but between the officers and those great men, and I acknowledge that they are greater men than I am.

4924. The question is, whether a board of men distinguished by their intellectual acquirements would, through their recommendations, lead more rapidly to the improvement and increase of the collections than the recommendations of the board of Trustees composed of men of high rank?—I think in the state in which society now is men of rank will have more weight; they will have the means more easily of carrying a point. I should trust more to the recommendations of the Trustees in both Houses and with the Government, than to the recommendations of learned men.

4925. In your opinion, and from your knowledge of the Museum, should you say that the Trustees take an active part in the Museum?—Not in the printed books; they have not generally that acquaintance they ought to have with it.

4926. In reference to patronage, do the Trustees manage the inferior departments in the Museum without consulting the heads of the departments?—I think they do.

4927. Is that desirable?—No, I should think not; the inferior departments certainly not. It would be well if, before putting a person in a department, the officers of that department should be consulted to know what they want, always in the way of suggestion.

4928. Sir *Robert Inglis.*] Have you reason to think that that has been neglected?—I do not know; I never heard that it has been done.

4929. Mr. *Compton.*] Do you think that if the Trustees of the British Museum were composed entirely of scientific persons they would be more likely to consult the officers at the head of the different departments than the present Trustees?—Never; scientific men are jealous of their authority, they are dogmatical and narrow-minded; and, as they think themselves infallible, they never would consult an officer; I think they would do the very reverse. If an officer was to suggest one way, they would just do the other, to show their independence and superior judgment. I speak from what I have known of them.

4930. Mr. *Hawes.*] Suppose the constitution of the Museum to be the following; that the executive department were entrusted to the officers, the heads of the departments, and that there were a superior board of Trustees, composed mainly of eminent scientific individuals, but combined with men of rank; what is your opinion of such a constitution?—That the scientific men would spoil the men of rank, or drive them away from the board. I speak seriously and from experience; an officer would have no chance against a scientific man who should take a crotchet into his head; and they are all crotchety. If he should take a crotchet into his head about classification, for instance, the officer would, I suppose, be allowed to state his opinion, and no more; but he must state it very quietly,

quietly, not to contradict a man who piques himself on his knowledge as a scientific man; and as an officer cannot like to quarrel with a Trustee, who may do him harm or good some time or other, the officer's opinion will not generally be given fearlessly and boldly. Then the scientific man goes to the board with the other Trustees; he states his case his own way, and the officer has no chance, because this Trustee at the board has the advantage of putting the thing before the other Trustees in a light which the officer has no opportunity of correcting, and on terms of equality as one of their body. One of these two things must then happen; either the plan which is made out, and which the officer is to execute, is a good one or not. If it be a good one, the officer is reduced to be a mere clerk, he has no weight in the case, he has just to execute what another man says. If it does not succeed, he cannot by any possibility convince the Trustees or the public, without an open rupture with his superiors, that the fault was in the plan, and not his own. If those scientific men sitting at the board are to make plans, and the officers to execute them, I should say that the scientific men at the board would do harm instead of doing good.

4931. But that is not the plan; it is proposed that the board of officers should have the entire executive of the Museum, each officer being independent, and responsible for the management of his own department, and it is proposed that the superior board of Trustees should have only a controlling power as to the general superintendence of the Museum and the conduct of the officers, would you give the same answer to a constitution so described?—Yes; because I think the executive would have to execute the plans which the board of Trustees with the scientific men decided upon.

4932. But assuming that a general plan, for instance, the nomenclature and classification in the Natural History department, or the mode of cataloguing in the Printed Book department, supposing that to be entirely in the breast and upon the responsibility of the officer of the department, whilst the details of the institution were managed by the heads of the departments assembled at the board; and supposing the superior board acted simply with reference to the general superintendence, in fact, sustaining the duties of Trustees merely; do you think the objections you have made would apply to this constitution as now described?—I do not see of what use it would be there being men of science at all, if they are only to act as the Trustees do, that is, without meddling with details. I want the Trustees to be men of independence, men of general information, gentlemen in the full sense of the word, rather than scientific men, if they are not, as they ought not, to bring any science to bear upon the officers.

4933. Would they not be able to exercise a sound judgment as to the recommendations of the officers respecting the improvement or augmentation of the various collections, and would not their joint judgment be a good ground for Government to proceed upon, in reference to grants?—No; I never saw scientific men go right, or view things as other people do. I am convinced they would annoy the officers, for the pleasure of showing their superior station, and differ from them for the vanity of showing their superior skill. I think the Trustees would be much better without them.

4934. How is it that the Jardin des Plantes at Paris has flourished so much under scientific men?—There are no Trustees there; the officers are directly connected with the government; and with that sort of government, and with the feelings of the people in France, it has done very well.

4935. But you think such a plan would not work well here?—I think not; because here literary men have not weight enough; a literary man has not an opportunity of being so much heard, and his opinion is not so much made of. In France it is enough for them when they have satisfied the government; here it is necessary to satisfy the Houses of Parliament and public opinion; and I think on those points the Trustees have more influence, and can better serve the institution.

4936. Do you think that those Trustees, by reason of their rank, have led, or that they have followed public opinion, in reference to the improvement which has taken place in the British Museum?—I do not know that they have done anything either one way or another; I think we ought to go much further; but that is my private opinion. Public opinion is exercised only upon one of the purposes for which the British Museum was instituted; that is, upon its establishment as a show place. Unfortunately as to its most important and most noble purpose, as an establishment for the furtherance of education, for study and research, the public seem to be almost indifferent. I am content that my assertion be tested by the feeling which is

expressed in the House of Commons when the British Museum is mentioned in that assembly.

4937. Looking at the collections which have been purchased recently, do you think the Trustees were the most active promoters of those purchases?- No; I think the officers were. I think the augmentation of Mr. Forshall's department is owing to his exertions, and to his having more opportunities than others have to speak to the Trustees. I think the other officers have exerted themselves, and that the Trustees have listened to them; but unfortunately in the Printed Books department that has not been the case; our just complaints have not been attended to at all.

4938. Then you think that an officer who is the head of any one department, being secretary to the Trustees, has rather an undue advantage over the other departments?—Yes; and if I were secretary to the Trustees I would preach for the Printed Books department. An officer that did not feel the interest in his department which Mr. Forshall feels, would be unworthy of the situation.

4939. Mr. *Compton.*] You think that each scientific person would be pressing for the advance of his own department?—I think the officers ought.

4940. Mr. *Hawes.*] Would you leave the trust exactly as it is?—I would leave the Trustees the same sort of men as they are now; but I should certainly think that it would be good for the Museum if the officers were a consulting body, presided over by a Trustee. The officers should be consulted at the board, and state their opinions on all details of matter; but the decision ought to rest with the Trustees; everything should be submitted to the Trustees. I have seen that succeed in the London University; I have seen it succeed on the continent. I think the library at Göttingen is managed in the same manner. The officers should represent their wants; they ought never to decide, but they ought to have the means of having their wishes made known; and if they met on stated days there would be no objection to the Trustees attending the meeting if they pleased, always leaving the Trustees the masters; they would hear what the officers had to say, then they would do what they thought proper.

4941. Amongst this body of Trustees you would object to scientific men, as such, forming a part?—Certainly; because I think the best scientific opinion and advice is to be had from the officers; they are the best judges of what is wanted in a literary and scientific point of view; in fact, to argue the reverse would be to argue that they had not the proper knowledge, and not the proper zeal, and then they must be sent away.

4942. Upon what ground were Mr. Payne Knight and Mr. Cracherode added to the board of Trustees?—It was before I belonged to the Museum; but I suspect it was not the least consideration the knowing that they had those fine collections and the hope of getting them; and a very proper ground of election it was.

4943. Upon what ground is the president of the Royal Academy, and the president of the Society of Antiquaries added to the Trustees?—The president of the Society of Antiquaries is supposed to be a man acquainted with antiquities, of which we have a collection, and medals and ancient manuscripts.

4944. He is added because he is acquainted with that particular department of science?—Yes; being always a man of high rank, and not an antiquarian as it were professionally.

4945. Has the Royal Society been always headed by men of high rank?—No; but when it was not the president did not do much better than now. The old officers will tell you that Sir Joseph Banks and Sir Humphrey Davy were not the best Trustees that could be had.

4946. Did they interfere a good deal with the officers?—I understood so.

4947. Do not you think that the institution at that time required the active interference of the Trustees?—That was long before I belonged to it; Sir H. Ellis will tell you how Sir J. Banks interfered.

4948. But he was a very active Trustee?—Yes; and by meddling so much he did mischief, as I have been told.

4949. Can you state what mischief he did?—It was before I was there; Sir Henry Ellis can tell it better.

4950. You have stated that greater facilities are given to the public in the reading-room than are given in any library abroad; you stated also that the highest class of students do not complain; do you think they are the class most likely to have grounds of complaint?—Just the same as the others; if there be any ground of complaint, I am sure they would have as much reason to complain as

as the others, I might say more. I mentioned one name, that of Mr. Hallam; if I were to find two tickets arriving at the same moment, I should say I would serve rather the stranger than Mr. Hallam, because I know he would not, if kept waiting, make any fuss, and this stranger perhaps might, and so for peace sake he has the chance of being worse served.

4951. Do not you think that a man of eminence, like Mr. Hallam, is sure to meet with attentions and consideration which an obscure individual might not?—Certainly not; that is a great mistake. I think when a stranger comes, he is always received and paid attention to with more politeness and with more zeal than if he was a friend of an officer; I am certain of that, not only in our department, but everywhere throughout the house every officer does the same.

4952. The same facilities are given to the most obscure individual as to the most celebrated and eminent persons?—Yes; not long since a poor woman came to the Museum; she wanted a newspaper about an enclosure. Mr. Baber happened to be present when she was addressing herself to me, and he began to ask questions about the enclosure, what it was and where it was; he gave her not only the newspaper which she wanted, but a great deal of information how she was to go about it to get her rights properly guarded. If she had been a lord, the only thing would have been a bow on introducing him to the reading-room, and giving the newspaper, he would then have had to find what he wanted by himself.

4953. Do you think the staff of the Museum at present is in proportion to the duties to be performed?—I think not, with the state of our catalogues; I speak of our department only.

4954. Have any representations of the want of more assistance been made to the Trustees?—I do not know of my own knowledge, Mr. Baber will state that.

4955. Are the new buildings in your department convenient?—I know nothing about them but by having seen them as a stranger might do, after they had been covered in. The plan was settled, at least the general plan was settled, before I belonged to the Museum; but that part which is intended for the library has been built since I have been in the Museum. The plan, I understand, has been greatly altered from what it was at first decided upon; I think the alterations were settled amongst the Trustees; they had a great many meetings, and there were building committees, and finally Mr. Baber had occasion to say something about it, but I never was asked, and therefore I do not know whether they will be convenient or not; I think not, for this reason: I think there is a want, amongst other things, of private rooms of a reasonable size to work in; if they are too small, as is the case with the little rooms joined to the King's library, there is no space for books and for papers, particularly for large books; then if they are too large, and if you are sitting in the library itself, first of all, people when they are benumbed with cold do not work so well, and next there are too many persons in the room; then again you cannot be denied, everybody intrudes upon you, and you do not know how to get rid of them. Add to this the continual interruption you are subject to by attendants coming backwards and forwards for books; all these things together will certainly render that part of the building not so convenient as it ought to have been if the rooms for the officers had been better chosen and better arranged.

4956. Have you ever heard of the officers of your department being consulted by the Trustees upon the plan since you have been in the Museum?—I think Mr. Baber was asked after the thing was decided; he certainly was not asked before, nor so much as he ought; but he will state that himself better.

4957. Sir *Robert Inglis.*] Are you aware of all the details of the proposed plan in the new buildings?—No, I have only seen the rooms.

4958. Mr. *Hawes.*] Do you disapprove of the forming a classed catalogue?—I do.

4959. Entirely?—Entirely.

4960. You think a classed catalogue would not furnish the student the same advantages in reference to books, that an alphabetical catalogue would with an index of matter?—Certainly not.

4961. Will an alphabetical catalogue with an index of matter, inform the students what books there are upon a particular subject in the Museum?—Certainly; much better than the classed catalogue.

4962. Is there such an index forming to your alphabetical catalogue?—No; it is not yet decided what we are to have; it has been suggested to the Trustees, and the papers I have mentioned will show that.

4963. Has any index of that sort been begun?—No.

4964. You

A. Panizzi, Esq.

7 June 1836.

4964. You are aware that a classed catalogue was begun?—It was.

4965. And a considerable sum expended upon it?—I know it; and it may be a matter of consideration whether after having spent so much, and having gone so far, it might not be better to complete it. But I contend that it will not prove so useful as index of matters, and that this index added to a good alphabetical catalogue, is a much more important work than a classed catalogue. This point also was touched upon in my report to the Trustees, which I have had the honour to mention so often.

4966. Sir *Philip Egerton.*] Could not the slips which have been prepared for the formation of the classed catalogue, be made use of in the formation of the alphabetical catalogue?—It has been done to a great extent since we began to correct the alphabetical catalogues.

4967. Then the labour which has been expended upon the classed catalogue will not be entirely thrown away?—Not entirely; but the correction of the alphabetical catalogue was not proceeded with upon the plan which Mr. Baber suggested at first; it was a correction which I did not much approve of, as I have had the honour of saying before.

4968. Mr. *Colborne.*] Under the present system, if it occurred to you that some improvement could be made in your own department, could you have any difficulty in having it submitted to the Trustees, either by submitting it to Mr. Baber, or by asking an interview with the Trustees?—It is a matter of delicacy; I should not like to push myself forward.

4969. Have you heard any complaints upon this head from the other officers upon the establishment?—No; I never have had occasion to speak with anybody upon the subject.

4970. Have you ever felt the pressure of that difficulty?—Certainly I have very often; because upon that very occasion of the catalogues it was by the merest chance that I could get at a Trustee to let the others know how much I disapproved of their departing from Mr. Baber's plan. I did no good; but I had the pleasure of feeling I had done my duty.

4971. Have the Trustees of the British Museum ever got the plates of Audubon's birds?—Yes, with General Hardwicke's library they have got such plates as were in that library; but I have seen Mr. Audubon since, and he said that we should not have the continuation, because the former numbers were badly bound by General Hardwicke, and broken; and that he (Mr. Audubon) would never allow such a copy of his book to be in the British Museum as a specimen of what his work is.

Henry Petrie, Esq., called in; and Examined.

Henry Petrie, Esq.

4971*. Sir *Robert Inglis.*] YOU are Keeper of the Records in the Tower, and are Fellow of several learned Societies?—I am.

4972. Have you been acquainted with the library of the British Museum, and with the reading-rooms there, for many years?—For many years.

4973. Are you acquainted with several public libraries on the continent?—At Paris particularly; but I am also acquainted with the public library at Rouen and at Brussels.

4974. Will you state to the Committee whether you found greater facilities in the reading-room of the British Museum than you found in the library at Paris, or in the library at Rouen, or in the library at Brussels, or the reverse?—I should say infinitely greater; but at the same time I ought to observe, that it is some years since I was on the continent: but making a comparison of the then state of the British Museum, with what I found upon the continent, I should repeat, infinitely greater facility at the British Museum.

4975. Were the facilities to which you refer facilities arising from the increased time allowed to students in the British Museum, as compared with that in the other libraries, or from the increased number of books open to students, or from both?—I should say from both. At the time I am speaking of the royal library at Paris was open only four hours a day, and this time was interrupted by many holidays; and, during the autumn, by a very inconvenient and long vacation of, I believe, six or eight weeks. With respect to the facility of obtaining books it is vastly greater in the British Museum. Perhaps I may be allowed to mention a circumstance which I have observed more than once in the royal library at Paris, arising, I presume, either from the want of a sufficient number of assistants, or from defective

419

Henry Petrie, Esq.

7 June 1836.

defective arrangement. I have known Van Praet, with the proverbial attention there shown to strangers, leave his seat and be absent for a very considerable time in search of a book wanted by a foreigner; and, in the meantime, his table was beset by a crowd of persons waiting for their several turns. Now, at the British Museum, you have only to give your ticket to the attendants, and the book comes to you, as it were, by magic.

4976. Will you state what facilities you have derived at Paris from the use of the catalogue, as compared with the facilities in the British Museum?—What I have just stated in a great measure answers that question; it must apparently have arisen from defective catalogues, that the keeper of the library was under the necessity of quitting his place in order to hunt for a book in some distant part of the library. If I were to confine myself strictly to the question, I should say, that the advantage of the catalogues in the British Museum is very great over that which I experienced from the catalogues at Paris.

4977. Do you feel satisfied with the hours and with the time at which the British Museum reading-room is open?—I should say abundantly, so far as my own observation or experience has gone.

4978. That is to say, that the six hours are sufficient, generally speaking, and that the six hours actually chosen are the six hours which you would prefer to be chosen in a public institution?—Certainly.

4979. What is your opinion as to the expediency of opening the British Museum by candle-light, so far as the question is not already answered by your last answer?—I should tremble at the thought of such a measure; if I were one of the persons in charge of the Museum, I should never go to bed without trembling.

Robert Huish, Esq., called in; and Examined.

Robert Huish, Esq.

4980. Sir *Robert Inglis*.] YOU are the author of a number of publications?—I am.

4981. Whilst writing your different works, have you had occasion to attend the British Museum reading-room pretty constantly?—Regularly.

4982. For how many years?—About 10.

4983. Have you felt satisfied with the facilities afforded you in the prosecution of your studies there?—Most unquestionably; I have no fault to find.

4984. Have you had occasion to consult foreign libraries; and can you state the comparative facilities that you have experienced in the one and in the other?—I consider that no comparison can be drawn between the library of the British Museum and foreign Libraries in regard to the facility of communication, particularly the library of St. Petersburg.

4985. Have you had occasion to read in the library of St. Petersburg?—It is not accessible scarcely to Englishmen.

4986. When did you first attempt to become acquainted with the library?—The first time that I was in St. Petersburg was in 1802.

4987. When did you last visit that library?—In 1830.

4988. Are you acquainted with the origin and history of that library?—It is rather of a singular origin, for it arose in a great part from the celebrated fête that every person conversant with the history of Russia knows was given by Prince Potemkin to the Empress Catherine. When he gave that fête, she remarked that in his palace there was only one thing wanted, which was a library. That wish of hers was tantamount to a command in those times; and, on the very next day, Potemkin sent for a celebrated bookseller at Petersburg to furnish him with a library. The bookseller questioned the Prince as to the kind of books he would wish to have it composed of: Potemkin replied it mattered not; little books at the top and great books at the bottom. It remained so from that time, and is actually the regulation at present on which the library at St. Petersburg is formed. That library of Potemkin's then became almost the foundation of the Imperial Library of St. Petersburg, and it accounts for the singular mass of trash which is there got together; for though it is a voluminous library, yet in point of worthless books it is not paralleled in Europe.

4989. What is the extent of the library?—About 200,000 volumes.

4990. Is it classed?—It is, but in a way that no other library is classed; being classed in reference to the size of the books, not in reference to the subjects. The quartoes are ranged together, the octavos together, and the duodecimos together; works of all kinds and subjects are mingled; you will find Mrs. Glass on the Art

Robert Huish, Esq.

7 June 1836.

of making Syllabubs placed next to Beattie on the Immutability of Truth, and you will find Fanny Hill supported on one side by Hudibras, and on the other side by St. Augustine.

4991. Have you had occasion to use the catalogue of the library?—I can hardly call it a catalogue; the books are mentioned in the pages, and that is all.

4992. Are you acquainted with the papers relative to the library at St. Petersburg, which have been published by the Committee of the House of Commons on the subject of the British Museum, in their Appendix, No. 32, to the Report of last year?—I have not seen them.

4993. In the answer immediately preceding the last, you referred to a catalogue of the library at St. Petersburg; though you hardly call it a catalogue: is it alphabetical, or is it classed?—It is alphabetical.

4994. What are the hours at which the library at St. Petersburg is open, if it can be called open, to the general student?—You can hardly call it open; it is by particular interest that you obtain admission; and at the time I was there, in 1802, an Englishman was not all admitted but by very great interest.

4995. Do you not refer to the time when the Emperor Paul was reigning, and a war was breaking out with this country?—No, we were at peace at that time. Paul was dead; but his hatred to the English was such that he passed a law not to admit an Englishman into the library, nor an English book, if he knew it; that law was not repealed in 1802. He interdicted all English books of a particular character.

4996. The last question referred to the northern alliance. At that time of course an Englishman was the subject of suspicion and jealousy?—Yes.

4997. Have you reason to think that any such facilities would have been given to any other foreigner or to any Russian subject as those which you enjoy in the British Museum, or which a Russian would enjoy here?—No such thing.

4998. You do not then wish the Committee to understand that the peculiar restriction of which you have complained originated in the fact of yourself being an Englishman, or that it would have been greatly relaxed to other foreigners?—It would not have been greatly relaxed to other foreigners.

4999. Therefore the facilities experienced by any students at St. Petersburg were greatly less than the facilities experienced by any student, native or foreign, in the British Museum?—Certainly.

5000. When you were at St. Petersburg in 1830, were the facilities greatly increased?—Very little indeed.

5001. In what way did you obtain admission to the library?—In the first instance through the introduction of Sir Charles Gascoigne, our celebrated outlaw, who was there at the time. You must have a permission, as it is called, of a privy councillor for admission to the library.

5002. Was any caution required?—No, an introduction is sufficient.

5003. What are the hours of admission?—From ten to two, and from six to eight.

5004. Does that period apply only to the summer, or to the winter also?—To the summer only; it is not open in the winter evenings.

5005. Artificial light, then, is never admitted?—Never admitted.

5006. Have you visited any and what other foreign libraries besides that of St. Petersburg?—I have visited the library of Vienna.

5007. Did you find any facilities in that library, or in any other foreign library, which you do not find in the British Museum, or which you would recommend for adoption in the British Museum?—None whatever; for I do not see that the plan of the British Museum can be amended with reference to facilities.

5008. In the evidence which you have given of the facilities which you have enjoyed in the British Museum, do you speak the experience of one who has had special personal recommendations to the officers of the Museum; or are the Committee to understand that you came to the institution, as any other gentleman might come, looking for your reception there only to the general courtesy of the officers and the general regulations of the institution?—I came there merely upon the regular introduction, the recommendation of a person well known, and since that time, the chief works of which I am the author have been compiled in that room.

5009. When you say the regular introduction of a person well known, do you wish the Committee to understand that you came there with any other recommendation than the formal recommendation required of everybody?—No other whatever.

5010. Therefore the facilities which you have enjoyed are such as any other gentleman

tleman carrying with him that formal introduction would equally have enjoyed?—Most assuredly; they would not be withheld from him, I am sure.

5011. In reference to the library at Vienna, have you any special observations to make?—Nothing particular, any further than that the facilities, when compared with the reading-room of the British Museum, are not to be put in comparison. There is a jealousy existing always in those foreign institutions that is not to be found in ours.

5012. Was the catalogue of the library at Vienna open to your inspection?—Certainly it was. One of the greatest defects in the library of the British Museum is the want of certain books which ought to be there, and which are not to be found in it.

5013. What class of books do you refer to?—I mean a general class of books which ought to be there as belonging to the literature of the country; for I mean to say that the British Museum is, in that respect, rather a disgrace to the country. It proceeds entirely from the niggardly disposition of the Government, which will not supply the means for the purchase of those books, and by which means the student is actually deprived of the very means of research which he ought to have.

5014. Will you state what class of books you specially designate as so deficient?—I will mention a particular circumstance. I am at present engaged upon a voluminous life of Cobbett, and it was necessary for me to have recourse to his Registers. In the course of the investigation I have found that there are 12 volumes wanting of that. Mr. Cates, in the reading-room, with that urbanity and kindness which he shows to every person, mentioned it to Mr. Baber, and he also, with that attention which he pays to the wants of the students, sent to the parties to know for what they would let him have those volumes that were wanting. The price that was fixed upon them was the enormous price of two guineas a volume, of course beyond the power of these parties to purchase them, so as to make up the 12 volumes. The gap is from 1812 to 1820. In consequence of that, a few days after, in my researches among the book-shops, I found 25 volumes of the Register at the price of 2 *s.* a volume, which it would have been advisable for the British Museum to have purchased; but there were no funds sufficient for the purchase of so small a thing as that.

5015. Did you represent the means of supplying the defect to the proper officer?—I did; but there are no funds. From the niggardly way in which those funds are administered by Government, those deficiencies cannot be supplied; books of minor importance, still, as matter of research, become important to the student. Now I will venture to say, that in the generality of the libraries abroad you will not find those deficiencies which you will find in the British Museum.

5016. You have stated that you made the recommendation of the purchase of that work to the proper authority; will you state the gentleman to whom you made it?—I made it to Mr. Cates, in the reading-room.

5017. You did not make it then on paper, and submit it to the librarian?—Certainly I did not.

5018. Have you reason to think that that representation ever went beyond the individual to whom you communicated it?—I think it went further than that. I have reason to believe that they had at that time no funds for the purchase of books.

5019. In point of fact, however, you have no direct and personal knowledge that the representation made by you ever came before the officer in charge of the department?—I have every reason to suppose it did.

5020. Is it not understood, generally speaking, in the establishment, and particularly in the reading-room, that representations of deficiencies in the Museum library will always be received if entered on paper, and regularly transmitted?—We do not wish to be thought troublesome in noticing these things, and we consider that the officers may know the deficiencies, and that they will fill them up as the opportunity presents itself.

5021. Is there any other instance in which you have discovered a deficiency, and have made on paper a representation of such deficiency to the chief of the department?—I have never made a representation to the chief of the department; I have confined my representation to Mr. Cates. For instance, I had occasion to refer to a book that ought to have been in the library long ago, the simple book of Fleetwood's Life of Christ; it was not in the library. The following day I told

Robert Huish, Esq.
7 June 1836.

Mr. Cates where that book was to be had, and he very handsomely sent and purchased it for the use of the library.

5022. When you say that Mr. Cates sent and purchased it, do you assume that he purchased it on his own authority, or rather that he made a representation to the chief of the department, and received his directions?—I should think he made a representation to the chief of the department. Upon the same principle it was with regard to my Life of George the Third; that book was not in the library, and he made a representation that he wished it should be in the library, and requested me to find a copy of it; I did so, and he paid me for it.

Jovis, 9° die Junii, 1836.

MEMBERS PRESENT.

Mr. T. G. B. Estcourt.	Sir Philip Egerton.
Sir Robert Inglis.	Mr. Compton.
Mr. Hawes.	Mr. Ridley Colborne.
Lord Stanley.	Mr. Bingham Baring.

MR. T. G. B. ESTCOURT, IN THE CHAIR.

John Gage, Esq., called in; and Examined.

John Gage, Esq.
9 June 1836.

5023. Sir *Robert Inglis.*] YOU are Director of the Society of Antiquaries and author of the History of Hengrave; and it is understood that you have formed large collections with a view to the history of your own county of Suffolk?—Yes, I am; and I have now got a volume in the press upon the county of Suffolk.

5024. Have you been in the habit of visiting the British Museum with a view to your several works, and to your general studies as a man of literature?—I have been in the habit of consulting and attending the Museum for more than 20 years.

5025. During that period have you experienced at all times such facilities as you desired?—I have always experienced every facility to the utmost.

5026. Do you attribute such facilities to your own personal acquaintance with individual officers of the Museum, or to their general courtesy, or to the regulations of the institution, or to all these causes?—I should attribute it to all. At first when I went there I was little acquainted with the gentlemen, and I think that I received the same facilities when I first went as I do now.

5027. In other words, you received as a stranger the facilities which you now enjoy?—I did as a stranger receive every facility whatever that I could wish; but perhaps in the situation in which I stand I have since been allowed greater privileges.

5028. Mr. *Hawes.*] Sir Henry Ellis is the secretary of the Antiquarian Society, is not he?—He is secretary to the Society of Antiquaries.

5029. Sir *Robert Inglis.*] When you first visited the Museum you were not the Director of the Antiquarian Society?—I was not Director till 1829.

5030. Mr. *Hawes.*] Were you a member then?—I was admitted a fellow of the society in 1818, but was a frequenter of the reading-room of the Museum at a much earlier time.

5031. Sir *Robert Inglis.*] In short, the facilities which you experienced were not, to the best of your belief, facilities extended to you as a fellow of the Society of Antiquaries, but as a literary man and a stranger in the Museum?—Yes.

5032. Mr. *Hawes.*] Were you acquainted with Sir Henry Ellis at the time you speak of?—I cannot say when my acquaintance first began with Sir Henry Ellis. I was admitted a reader of the British Museum for the first time, in 1810, on the recommendation of Mr. Charles Butler, and this was, I think, some years before I knew Sir Henry Ellis, or before I was acquainted with any gentlemen of the Museum.

5033. Sir

John Gage, Esq

9 June 1836.

5033. Sir *Robert Inglis.*] Are you acquainted with any public institutions on the continent, in which there may be great collections of manuscripts or of printed books, either as distinct libraries or as attached to other institutions?—I am more particularly acquainted with the library at Rouen than with any other library on the continent, though I have occasionally consulted the library at the Vatican, and I have also seen something of the library at Paris. But I have not seen sufficient either of the Vatican or of the Paris library, to form a comparison between our own and theirs; but with respect to Rouen, I am better informed in some respects. At the same time the Rouen collection is not so great as to be put in comparison in any respect with our own.

5034. The institution of Rouen is, however, a public institution, supported by the government?—By the government; it contains some most valuable manuscripts.

5035. Mr. *Hawes.*] Is it supported by any public grant from the government?—It is supported in the ordinary way. There is, I believe, a certain allowance from the government, and some from the department, or city.

5036. Sir *Robert Inglis.*] The object of the question as to its being a public institution, was to show its contradistinction from a private institution supported by voluntary annual subscriptions?—It is public in every respect.

5037. Mr. *Hawes.*] As to the facilities of access to the library at Rouen, are they great?—I went there, of course, under particular circumstances, and therefore the facilities to myself were very great, for I was there at all hours, from an early hour to a late one; but with respect to other persons, as far as I understood, there was a limited time. It happened that in the different years I was at Rouen, I was always there during the vacation, and consequently the public were precluded from coming there.

5038. Is there a good catalogue of the library?—The catalogues, as far as I remember, are not very remarkable, and the manuscripts themselves are not, some of them, in a very good state.

5039. What is the kind of catalogue?—I have had the catalogue occasionally in my hands, but I could not say the order in which it is done.

5040. Is there a good synopsis?—I do not think there is.

5041. Sir *Robert Inglis.*] What are the hours of opening and closing the library at Rouen; do they vary according to the season?—I do not now remember.

5042. With respect to the knowledge which you possess of the Vatican library, will you state how far the facilities there enjoyed by literary strangers equal or exceed those in the British Museum or fall short of them?—I never was much at the Vatican; I have gone there with friends, and have merely occasionally seen a few manuscripts, but not so as to occupy me in any research to enable me at all to judge. I beg however to refer the Committee for information in regard to attendance at that library, to a letter which I received in 1830, from bishop Gradwell:—

Copy of a Letter from Dr. *Gradwell*, V.A., to Mr. *Gage*.

Dear Sir, Castle-street, 11 March 1830.

Not having the elenchus of the days and hours when the Vatican library is open to readers, I cannot give you the information you desire with all the exactness I could wish; but will give it to the best of my recollection. In the first place, it is shut to the public from before Christmas-eve till about the middle of January; about a week or 10 days at the Carnival; during Holy week and Easter week; a few days, perhaps the whole week, at Whitsuntide; from about the middle of September till Martinmas; all great festival days; the anniversaries of the Pope's election and coronation, and a few others; and on all Sundays. In all other days the library is open from nine o'clock till noon.

I have, &c.

John Gage, Esq., Lincoln's Inn. (signed) *Robert Goodwell.*

5043. Practically speaking, do you understand that the collection at the Vatican is open to strangers in the sense in which the library at the British Museum is?—Certainly not; from conversations that I have had with persons who have been occupied there, I believe that it would take time to find the manuscript required; for I have understood that generally, on asking for manuscripts at the Vatican, you have to wait a day or two before they are produced; but I do not say this of my own knowledge.

5044. Does any such delay occur to the student or general visitor in obtaining a sight of a manuscript in the British Museum?—Never.

John Gage, Esq

9 June 1836.

5045. Mr. *Hawes.*] Does not that depend upon whether he knows the manuscript he wishes to see?—If a person is not capable of distinguishing what book he wants, of course the assistant cannot bring it to him; for myself, I may have sometimes mistaken the reference, but generally speaking I never have had to wait; never, certainly, for a day to find anything.

5046. Supposing the title of a manuscript to be forgotten, but the subject remembered, is there any means in the British Museum of finding the manuscript in question by the subject of it?—I think in such a case as that, I have gone to gentlemen in the Museum in whose departments the particular works might be, and their information has very often led to my finding the thing which I either did not perfectly understand, or had some difficulty in distinguishing.

5047. In that case it depended upon the memory of the keeper or keepers of the manuscripts?—In that case I have had the advantage of their assistance.

5048. Sir *Robert Inglis.*] In the Vatican is there any catalogue of the manuscripts at all accessible to the general reader or casual visitor?—I never saw any.

5049. Is there any catalogue of the printed books accessible to the general reader or casual visitor?—I never saw one at the Vatican.

5050. In other words, a stranger going to the Vatican, even if admitted (and from the preceding answer it appears that he is not admitted with the facilities which exist in the British Museum), would have no facility whatever for ascertaining the extent of the collection, either of printed books or of manuscripts, or of knowing the presence of a particular book, unless he were personally acquainted with the librarian?—Yes, I apprehend, so far as I have understood from individuals, that it would be attended with considerable difficulty to come at many manuscripts and works.

5051. Upon a general view of all the catalogues of manuscripts, and the catalogues of printed books existing in the British Museum, do you consider that they furnish a mass of information and a facility of reference exceeding any which you know to exist in any library, foreign or domestic, public or private?—Certainly.

5052. Mr. *Hawes.*] Do you know any other library or any other similar institution existing in any country whose means are so great, or for the benefit of a people so active as that of Great Britain?—I am not acquainted with the Paris library. None that I am acquainted with are to be put in comparison with the British Museum.

5053. Do you know any country so wealthy as Great Britain?—No.

5054. Do you know any people whose interest in popular literature is so great and so general as that of the English people?—The French of course are a very literary nation.

5055. Would you compare the cheap publications of France, in point of extent, with the cheap publications in England?—No.

5056. In proportion to the means of the country, and the interest taken by the people in the British Museum, do you think the institution corresponds with that interest, and with the means at the disposal of the Government?—I know of none to be compared with the British Museum.

5057–5058. Do you think the British Museum in point of extent corresponds with the wealth of the country?—Yes, perfectly so.

5059. You are satisfied with its present state in reference to the means at the disposal of the Government for improving it?—I am perfectly satisfied; but if more money were allowed for printed books, they might be bought with advantage; for there are branches of literature in which printed books are wanting. Altogether, the British Museum must be considered as a very great institution, and as far as I have seen, I am perfectly satisfied in every respect with the management of it.

5060. Sir *Robert Inglis.*] You are aware that the Paris library has existed about two centuries, and that the Vatican library has existed from the revival of learning, and that the British Museum has not existed a century?—Yes.

5061. And therefore though the collections in the British Museum should be found to be inferior in manuscripts and in the Printed Book department to those of the Vatican or of Paris, some part of such inferiority might be attributed fairly to the comparatively short duration of the establishment?—Certainly.

5062. Mr. *Hawes.*] Are you aware of the sums annually spent on printed books in the British Museum?—No, I do not know the precise amount; but I think that more money might be spent on printed books, particularly foreign works.

5063. Sir *Robert Inglis.*] Have you found considerable facilities in consulting in

in one and the same room at the British Museum printed books and manuscripts; in other words, have you found any difficulty in getting in the reading-room printed books and manuscripts at one and the same time?—I have not found any difficulty in getting either the one or the other in the same room. Perhaps in the examination of some of the manuscripts they might be better examined in a separate room.

5064. Are you aware that there exists a regulation in Paris that a manuscript is not to be brought into the printed book room?—Yes.

5065. A printed book, however, may be brought into the manuscript room at Paris?—Yes.

5066. But practically in the British Museum you have found complete facility in consulting any printed books or manuscripts, together or separately?—Certainly.

5067. Do you feel satisfied with the hours and the time during which the British Museum is open?—I do not myself see any objection to the hours; I think that the hour of 10 o'clock is quite as early as one can very well attend.

5068. Can you state from recollection how many books at a time were allowed to you in the Vatican?—No, I cannot.

5069. Have you found any facilities in any foreign library which you have not found in the British Museum, and which you could recommend for adoption here?—No, I have not found any facility which I have not found here.

5070. Mr. *R. Colborne.*] You say 10 o'clock is early enough to attend; do not you think it might be advantageous to the public if it was open later than four in the summer months?—In the summer months certainly; if it remained open till five o'clock it might be an advantage to many persons.

5071. And during the holidays, when there are so many people at liberty, would it not be advantageous to the public that it should be open then?—I should think that the officers of the Museum require some relaxation as well as other persons. In the libraries abroad they have vacations.

5072. But supposing the staff were increased, do not you then think it would be advantageous to the public, so as not to deprive the officers of a certain portion of relaxation, and yet give the public the advantage of greater facility of visiting the Museum?—Of course the more opportunity you give to the public the greater the advantage; but I still think the liberty is now great.

5073. Sir *Robert Inglis.*] As an antiquary as well as a man of general literature, have you had occasion to consult the medals and the gems in the British Museum?—I have sometimes had occasion to consult the medals, and also some of the different gems, and other objects of antiquity in the British Museum.

5074. Have you found such facilities as you had a reasonable right to expect in such consultation?—Certainly.

5075. The same, in fact, in respect to the department of antiquities which you have enjoyed in respect to the departments of manuscripts and printed books?—Yes; and always I have found the object directly.

5076. In the departments of arts and antiquities have you experienced such facilities owing to your personal acquaintance with the individual gentlemen at the head of such department, or from the general regulations of the Museum, or from both?—I should think from both; but as I have very often been in the medal-room when strangers have come there, and I have seen the same facilities shown to them as to myself, I should think it is general.

5077. Have you experienced any equal facilities, or have you reason to believe that a native would experience equal facilities, in consulting the medals or the gems, or the coins, or any works of art in the library at Paris, or in any other foreign library with which you may happen to be acquainted?—I should very much doubt it.

5078. At any rate, do you believe that they could experience greater facilities?—It is impossible.

5079. Mr. *Colborne.*] Are there many British antiquities in the British Museum now?—There is not so large a collection of British antiquities as one would wish to see there, and that is a department I should like to see greatly increased.

5080. Do you think it would be a desirable thing that a separate department should be made?—I do not know as to a separate department; but I think that a separate room might, with great advantage, be entirely appropriated to objects of British antiquity.

John Gage, Esq.

9 June 1836.

5081. Do you think there should be a classed catalogue relative to those antiquities?—I should think so.

5082. Do you think that could be made with facility?—It would require, of course, some time and judgment to do it; but I think it might be done.

5083. Mr. *Baring*.] Are you acquainted with the medals in the British Museum?—I have occasionally consulted some coins for the Society of Antiquaries.

5084. Do you think that 5,000 *l.* would be well laid out in giving to the public engravings of the medals in the British Museum?—I should certainly say, that if you could give to the public a fine series of engravings of medals, it would be a national work that would do you great credit. I could not speak as to the sum required; but I should say that whatever was wanted to do it, if you could afford it, even in a series of years, that a work on medals would be highly creditable to us.

5085. Mr. *Colborne*.] You do not think that is a work that could be carried on by private speculation without some public aid?—I think it would require public aid.

5086. The question of course refers to its being done in a superior way, such as the Napoleon medals?—Just so.

5087. Sir *Robert Inglis*.] In reference to the collection of British antiquities, can you state whether any considerable accessions have recently been made, within the last few years, to that department in the British Museum?—Yes.

5088. You consider such additions to be intrinsically valuable as well as large?—Highly so; there is one which has just occurred, and I have myself been occupied in writing a paper upon it for the Society of Antiquaries, and the purchase of which, I think, has done the Trustees credit; and that is the gold British corselet, which, from correspondence with other countries, appears to be unique.

Robert Hannay, Esq., called in; and Examined.

R. Hannay, Esq.

5089. Sir *Robert Inglis*.] YOU, for some years, studied in the Reading-room of the British Museum?—For several years.

5090. You have also had, in the course of your experience, considerable opportunities of knowing foreign libraries?—Very great.

5091. Do you feel satisfied with the hours and the time at which the British Museum is open?—I feel not only satisfied with the time, but I am persuaded that it will be found eventually impracticable to extend the hours.

5092. Do you compare the British Museum in this respect with any foreign museum or library, or, generally speaking, with what you believe to be the habits of literary men, and the conduct of public institutions?—I beg leave to explain the reasons why I think it impracticable eventually to extend the hours. By the experience of the libraries of Europe all are limited within six hours, under one exception, that of the public library at Naples. Now what has produced this rule must have been one pervading necessity; and that necessity is the difficulty, I should rather say the impossibility, of keeping a great library in order, unless certain hours be reserved daily for replacing and re-arranging the volumes returned; and in practice such is the fact. At present the number of books in daily use by the readers requires from two hours and a half to three hours for re-arrangement, so that they can be found on the following day.

5093. Have you ever made use of the Vatican library?—I have.

5094. In the answer which you gave with reference to the number of hours for which other public institutions are open on the continent, are the Committee to understand that the number of six hours is the universal extent, except in the Neapolitan library, or that it is the maximum?—It is the greatest length of time that is admitted in any; but very few of them are open so long. The French library is from ten until three.

5095. In the French library is a book given to the reader after half-past two?—No, you cannot get any book within the last half hour.

5096. By the rules of the institution no book is given out to the student within 30 minutes of the close of the library?—No; they say they cannot do it.

5097. What are the facilities which you have experienced in the Vatican library as to the days and hours of admission, and the number of books or of manuscripts which you could obtain?—I have read manuscripts and books there, but I soon found that the difficulty of obtaining either was so great that I was compelled to abandon study,

L27

study, though I had peculiar advantages, my private tutor in Italian, Signior Sozzi, being the under-librarian of the Vatican, a respectable and learned man; such, however, was its disorder from want of catalogues, and so little is it the desire or the design of the Papal government to make it useful, that hardly anybody resorts to the Vatican library for study.

5098. Then whatever may be the actual extent of the riches of the Vatican, either in printed books or in manuscripts, [as such extent of riches might be displayed in catalogues, if such catalogues existed,] there is practically no such facility to the student in the Vatican as you have enjoyed in the British Museum?—None. The extent and riches of the Vatican library have been much over-rated. I was assured by Signor Sozzi, under-librarian, and in 1826 employed in forming a better catalogue, that the utmost number of printed books in the Vatican library could not be reckoned above 72,000. The number of manuscripts can only be conjectured; they are very numerous, and for ancient literature doubtless very valuable. But in numbers the manuscripts in the Vatican fall far short of the collection in the Bibliothèque du Roi at Paris; and for public utility the Parisian manuscripts are accessible to all; those of the Vatican to few, I ought rather to say none but favourites of the Papal government.

5099. You are aware of the great difficulty of ascertaining in any public library the actual number of books?—Yes, all is vague; no two librarians will give you the same answer, and it is impossible they should, for they have no settled nor general principles of numeration.

5100. Variations arise from one collector or librarian enumerating every article in a collection of pamphlets as a distinct work, and from another collector considering all the volumes of a great literary journal as also one work? —That is one source of error in reckoning printed books; but in numbering the manuscripts of a library this is felt still more; manuscripts being usually catalogued by works or by volumes, and frequently in the same volume 10, 20, 40, aye, 50 distinct tracts are bound up together and described by one name. This practice pervades all libraries.

5101. You have possessed individually considerable facilities in the access which you enjoyed to the Vatican; have you reason to think that a native of Rome would have possessed any corresponding facilities to those which you as a stranger enjoyed?—To such a question I can only answer, that if the Romans did possess access to the Vatican library they did not exercise it. The reading-room there is small, inconvenient, and rarely frequented by above a dozen students; and this is the more remarkable in a city where about every 14th inhabitant is a priest, consequently about every seventh male, and, deducting boys, about a fourth of the men of mature age. But who with common sense would believe that the Vatican library can be designed for public instruction and the advancement of knowledge, while the Papal government forbids its subjects to possess or to read the best and wisest works of man, as those of Bacon, of Newton, of Locke, of Leibnitz, while, I say, it forbids them even to read the writings of Machiavelli and Galileo?

5102. Is there what can be considered a catalogue of the printed books of the Vatican to which the world have access?—None; when I was at Rome they had no accurate catalogues for their own use.

5103. Was there any other library in Rome, beside the Vatican, to which you had access?—There are several libraries at Rome; the first is the Minerva, which is well frequented: but in Rome some of the nobility open their libraries to students; that of the Prince Corsini is valuable and extensive, and, highly to his honour, librarians are kept for the service of the public. This is one of the munificent acts of that ancient and illustrious family.

5104. In the Minerva library is there a catalogue?—There is, but I am not so well acquainted with it as to answer respecting it.

5105. Did you find the facilities in that library, so long as you had occasion to seek access to it, greater or less than you have found in the British Museum?—Much less than I have found in the British Museum.

5106. Do you know how many hours the library of the Minerva was kept open? —I forget.

5107. Are you well acquainted with the Bibliothèque du Roi, at Paris?—Yes, with the departments of the manuscripts and with that of the printed books.

5108. Have you studied there since the last ordinance for the regulation of the library, issued by the present King of the French?—I have.

5109. Will you state what facilities you enjoyed there, and whether you consider them equal to those which you enjoy, or which a Frenchman could enjoy here in the

R. Hannay, Esq.
9 June 1836.

the British Museum?—In the manuscript department the facilities are as great as can be found in any library; they are, however, subjected to the evil of bad catalogues. In 1831 I devoted some hours daily in investigating what manuscripts were to be found in the Bibliothèque du Roi regarding English history, constitution and laws. I found the catalogues in the greatest confusion; sometimes the age of the manuscript was erroneously entered, sometimes its subject, sometimes 20 different treatises were bound up in one volume and only one of them noticed in the catalogue. These are, however, difficulties attending the catalogues of the library, and not obstacles by any existing regulations. Nothing could exceed the polite attentions of the gentlemen who have the care of the manuscript department to myself and to all present.

5110. The number of hours during which the manuscript department of the Bibliothèque du Roi at Paris is open, is less than that in the British Museum?—It is one hour less, and practically, it is an hour and a half less. There the utmost length of vacation allowed in the British Museum is three weeks and three days; but in the Bibliothèque du Roi it is shut for two months; 15 days at Pâques, and from the 1st of September to the 15th of October.

5111. It is shut also during the fêtes?—Yes, which are very numerous; probably for two months and a half the Bibliothèque du Roi is closed against the public.

5112. You have referred to the incorrectness of the catalogues of the manuscripts so far as they exist; have you ever had occasion to compare the catalogues of the Harleian Manuscripts, for example, with the catalogue of the manuscripts in the Bibliothèque du Roi; can you state what proportion the accuracy and extent of the description in the new Harleian catalogue bears to the accuracy and extent of the description in the catalogue of the Bibliothèque du Roi?—The catalogue of the Harleian manuscripts, though subject to some errors, is in general accurate; I have seldom found any manuscripts incorrectly described.

5113. Is it considerably more full as well as more correct than the catalogue in Paris?—That is beyond all doubt.

5114. Are you acquainted with any printed catalogue of the printed books in the library at Paris, of a later date than that which was printed in the year 1741?—To what year the catalogue of printed books comes down, I cannot positively answer, because access to the catalogue itself is denied to strangers. In the manuscripts the regulations are good, but in the printed books, the whole plan and practice is extremely bad.

5115. In fact, no stranger is permitted to have a sight of the catalogue in Paris?—No, by the rules and practice, none are allowed to use the catalogues of printed books.

5116. Are you aware whether the catalogues of manuscripts are exhibited every day in the reading-room of the British Museum, and are accessible to every reader, however humble?—All catalogues whatsoever are open, and in constant use by the students in the British Museum.

5117. Can you state what catalogues are there?— All the catalogues of the printed books and of the manuscripts, both of the British Museum and of the King's library, are accessible to the public at all times, and it is one of the great advantages that the British Museum possesses over the Bibliothèque du Roi.

5118. Did you obtain your books as easily in Paris as in the library at the British Museum?—No.

5119. What length of time intervened between your asking for a book and your receiving it, upon the average?—I should say from half an hour to an entire day, but frequently I could not procure books after having waited several days, and been promised them.

5120. What length of time intervenes, taking the average between the time of your asking for a book or a manuscript in the British Museum, and the time of your receiving it?—I should think it rarely exceeds from five or seven to 10 minutes.

5121. Are you aware of the length of way which it is occasionally necessary to traverse in the British Museum, in order to procure for a reader in the reading-room a work which he may desire, and which may be found at the extremest point?—From the extreme point, with all the turns and windings, it may be a quarter of a mile nearly; in short, books are brought as soon as you could expect them.

5122. How many books at a time were allowed you in the Bibliothèque du Roi?—I have never put this to the test, I have had two or three at once.

5123. Are you limited in the British Museum?—Unlimited.

5124. Both with respect to manuscripts and with respect to printed books?—Both.

5125. Can you state to the Committee any instances of the want of completeness of sets of books in the Bibliothèque du Roi?—It is impossible to make such a statement, for the catalogues are denied, and if they are accessible, yet they are so imperfect that no reliance could be placed upon them; the losses are very great. By their own admissions, if I rightly understand the "résumé" of their affairs, one volume in 28 has been lost.

5126. That is to say, that supposing the library consisted of 280,000 volumes, 10,000 would be missing?—Yes, such appears from the "résumé" delivered to their government.

5127. Are you aware whether this defalcation arises from the practice of lending books out, or do you attribute it to any act of spoliation on the part of the persons admitted to the reading-room?—I apprehend there have been many causes for loss: first, from carelessness and negligence in preserving accurate receipts of the delivery and return of books lent out of the library, as is done in all other great libraries that lend out their books; second, from thefts committed within its walls, where all are admitted who present themselves, and some unworthy of confidence.

5128. Are you aware whether any restriction at all exists at Paris to the admission of any one to the library?—None that I know of by the regulations; but I apprehend they are now beginning in practice to be somewhat more strict. But is this being wise behindhand. When I was first in Paris in 1824, I used to frequent the reading-room of printed books, and I have seen persons there who came evidently from other motives than for study. For example, a man sat down by me; a book was placed before him; he opened the book with the wrong side upwards and affected to be reading. His dress, manner and expression betokened the lowest state of wretchedness, leading me to conclude, either that he sought the shelter of a roof, or a momentary refuge from the pursuit of justice. Such miserable objects were not unfrequent in the reading-rooms of the Bibliothèque du Roi, before the late regulations.

5129. Are you aware of the restriction at the British Museum to the admission of persons?—Yes, and it ought to be strictly adhered to.

5130. You regard that as sufficient, and not more than sufficient?—Experience has shown that it is barely sufficient; even the existing regulations have not been able to preserve both books and manuscripts from occasional injury.

5131. You would not recommend any alteration in that?—Certainly not, unless greater strictness as to manuscripts and records.

5132. The regulation being that every person is admitted to read in the Museum who can produce a recommendation from a housekeeper resident in London, or who is personally known to one of the officers?—Such I understand it to be.

5133. In the case of the British Museum, the person recommending being supposed either to be respectable in point of station, if not personally known to some one officer of the Museum?—Such a precaution I hold to be indispensable, where public property of great value should be entrusted to a stranger's hand. No day passes over, no, not an hour, in which records and documents of great value in proof of public and private rights, are not delivered to readers in the library; which, if lost, could never be restored. The Parliament and the Trustees of the British Museum have two duties to perform; the one to preserve its treasures, the other to offer them to the public so far as safety will admit. But let it never be forgotten that upon their security depends their use.

5134. Mr. *Colborne.*] Are you aware of its ever happening that any students have found a difficulty in getting this recommendation. Has any student ever complained to you of the difficulty he has experienced in getting this recommendation?—None; but I am not much in the way of hearing those complaints, being but little acquainted with those who resort to the British Museum.

5135. It may have happened without your knowing it?—It may.

5136. Sir *Robert Inglis.*] But as a general proposition, and comparing the state of the Paris library with that of the British Museum, you do not recommend that any relaxation of the existing regulations should be made by the Trustees?—None as to admission.

5137. Are you acquainted with the library at Dresden?—I am, intimately; I spent

R. Hannay, Esq.

9 June 1836.

I spent a winter at Dresden, and in that time I became acquainted with the librarian, Mr. Falcenstein.

5138. What was the accommodation afforded to you in the library?—Everything I could desire. It is one of the greatest and most valuable collections in the world; perhaps, for selected books, it is the very best. It consisted then of better than 400,000 volumes, and, if I do not mistake, of about 15,000 manuscripts; but I see them stated in the returns at 2,500, which I take to be an error. The library of Dresden is the great library of the kingdom of Saxony, and, like the public libraries of northern Germany, it lends its books out. I never read in the library, and very few ever do. Readers are entrusted with four volumes at the same time at their homes. Exact books are kept of the delivery and return of all books. They are lent out for a limited time, and no loss or inconvenience has been felt by the practice.

5139. Does the administrator of the library require any caution or security on the part of the person to whom the book is lent that he will restore it?—A foreigner must have the introduction of the ambassador or minister, whatever rank he may hold. With respect to natives, they must be either personally known, or they must have a responsible person to become surety for them. It was my banker that became responsible for me. On this introduction I got out any books I would within the number fixed by the regulation.

5140. What number of persons enjoy this privilege, so far as you are aware of the fact?—All respectable persons.

5141. Mr. *Baring.*] Is there any limitation as to the time that the books may be kept?—The precise limitation as to time I do not remember.

5142. Suppose any one were writing upon a particular subject, and were to withdraw from the library all the books upon that subject, could not he by so doing prevent any person from undertaking a work of a similar kind?—To prevent this inconvenience, in all libraries that lend out books the classes of books are restricted, the number of volumes and the term of their return. Besides, whether they are read in a public library or out of it, no two persons can conveniently pursue the precise studies from the same volumes at the same time.

5143. May not an individual, by retaining those books in his own possession for a considerable period, though he may not be using them every hour in the day, by that means prevent another person from taking up that subject, and in that manner monopolize it, as it were, to himself?—Books lent out are read with despatch, because they must be returned soon, and if not returned at the appointed time they are demanded. Besides, experience is the great master; that has shown that on lending out books the inconveniences are few and the advantages great, both to libraries and readers.

5144. Sir *Robert Inglis.*] Were any manuscripts lent out at Dresden? There were.

5145. Was there any limitation in the class of manuscripts lent out?—Rare manuscripts are not lent, or only upon occasions which required indulgence. There are likewise many classes of books which are never permitted to be taken from the library. Other libraries have established a similar rule.

5146. Did you ever make use of the library of Munich?—I did.

5147. Will you give the Committee any information which you possess respecting that library?—It is a very valuable and extensive library; it is equal in extent, I believe, to any of the German libraries; but the exact number of volumes was not precisely known, for it consists of three collections, the ancient ducal library, the royal library, and that part of the royal library collected from suppressed convents; the latter part was, in 1826, uncatalogued. The manuscripts are numerous and of very great value. The regulations are very liberal. There also, as at the library at Dresden, they in practice lend out books, and without loss or inconvenience.

5148. Did you possess in the hours of attendance there, or in the number of books which you could receive in the reading-room, greater facilities than you enjoyed in the British Museum?—In no library are so many facilities enjoyed as in the British Museum.

5149. Can you state to the Committee the comparative rank of the library of the British Museum among the libraries of Europe in point of extent?—That is a question that cannot be answered with precision, not, I believe, if all the librarians of Europe were present. There are so many different ways of computing the number of volumes in a library, that it is impossible to give any distinct

431

distinct answer to it. As an approach, however, towards a comparison, I believe that the Bibliothèque du Roi is admitted to contain, of all libraries, the greatest number of MSS.; it claims also the first rank in the number of printed books; but this pretension is very doubtful.

Next to the Bibliothèque du Roi the British Museum does, I am very sure, possess the greatest collection of books and MSS. in the world. The libraries of Dresden and Munich follow next in rank, but which should have the precedence I shall not venture to say.

The library of the King of Denmark may be ranked after them. Then follows the library of Göttingen. I see in the official returns that the imperial library of St. Petersburg is estimated at 400,000 volumes; if so, then the British Museum may be fairly held to contain a million.

None of the libraries of Italy can be compared in extent to those of England, France, and Germany.

The Magliabeccian at Florence and the royal library at Naples, are both the most numerous and useful collections in Italy. The Ambrosian at Milan is of great riches in MSS.; but then there is no catalogue, even in writing, and none by the founder's will allowed to be made. The Vatican has long stood pre-eminent among Italian libraries, and in MSS. it still maintains the first rank; but in printed books it never did possess either a numerous or well chosen collection.

The imperial library at Vienna is also a vast and most valuable collection, both of MSS. and books, and no library on the Continent is so generously supplied with funds for the purchase of books.

But let us not suppose that the intrinsic value of a library can be ascertained by the number of its volumes, still less that numbers form any test of its utility to the world.

The MSS. certainly and perhaps the books in the French library exceed those in the British Museum; but in utility to their respective nations there cannot be a doubt that the British Museum stands pre-eminent above the French, and above all other libraries in Europe.

The British Museum is becoming every day more and more the common reservoir of learning, wherein are composed those periodical works which are diffusing knowledge through society; the reservoir, I repeat, whence those publications conduct as pipes the stream of knowledge to individual minds.

5150. Mr. *Colborne.*] By your account, though there is more facility in the British Museum than in the Vatican, Dresden, Paris, and Munich libraries, yet still do you not think an extension of facilities to the public might be afforded in the British Museum?—I do think so; and not only think that additional facilities may be granted, but that they must be granted, to fit the Museum to the growing wants of society, but under the existing guards upon admission, without which no library can be preserved, as experience proves.

5151. Have you any suggestions to make as improvements upon the present system?—I shall now state to the Committee what might be wisely, safely, and advantageously introduced into the management of the British Museum. In the first place, regarding the government of the British Museum. The first consideration as to its government is this. The British Museum is not solely merely a library, as the public suppose it to be; it is one of the great archives of the state, for the preservation of the records and evidences of our history, our constitution, our laws, and of the private rights of families; and it is the daily resort of persons employed in the investigation of public and private rights. It is an archive of state because it contains a vast collection of the records of state, deposited there by the legislature for preservation and national use. It is an archive of state by the intention of the statute of its foundation. By the 12 William and Mary, "the titles of manuscripts, parchments, papers, records, and and other memorials, and also the number of the pages and folios thereunto belonging, shall be enrolled in the High Court of Chancery."

5152. Sir *Robert Inglis.*] Does this refer to the Cotton?—This refers to the Cotton library, which is the foundation of the British Museum. It is the nucleus, the kernel of the whole, and still the most valuable part. Then, in conjunction with the Cotton, the Harleian family founded their vast collection of records and documents, to be preserved in the same place and for the same purposes as the Cotton library, and therefore both are, by the statute 5 Queen Anne, declared to be united and deposited together for perpetual preservation and public use. Secondly, certain families have reserved to themselves, as the Cotton family, the Harleian family, and the family of Sir Hans Sloane, a perpetual right of visitation,

R. Hannay, Esq.

9 June 1836.

inspection and share in the government of the Museum. These are reserved rights of property, just as much as the original manuscripts and records were their property. Under any change of government those gentlemen must retain their rights. Thirdly, the Cotton family bestowed this noble gift upon the nation upon condition that it should be placed under the care and custody of the nation, represented by the chief of the law, the Lord Chancellor, the chief of the church, the Archbishop of Canterbury, and the chief of the Commons, its Speaker.

So that by the will and conditions of the founders, and by the intention and authority of those statutes, the British Museum is one of the great archives of state, placed by Parliament under the care and custody of those officers of state.

So far I hold the government of the Museum to be fixed.

Still the internal government of the Museum, with the distribution and exercise of the powers, may be changed, and, if I mistake not, changed with advantage for the institution.

The change I should suggest is, that the heads of the several departments of the Museum be formed into a board of administration, for the ordinary business and management of the whole Museum; and that the Trustees preserve superintending powers, to be exercised as a board of control.

5153. Mr. *Colborne.*] Do you mean that they should select a committee from themselves, and meet only once in six weeks or three months, to inspect what their own committee have done?—My meaning is that the heads of the several departments should form a board of management for the ordinary affairs of the Museum, subject on all important affairs to the control of the Trustees.

Secondly, I beg leave to suggest the introduction of certain changes in the departments of MSS. and of books.

As to manuscripts, the great object of the Cotton library was the preservation and collection of memorials in proof of the laws and constitution.

This original design has been wisely pursued by the addition of the Harleian, the Lansdowne and the Hargrave collections. It may be still farther advanced by the three following plans:

First, by obtaining from the public archives either the originals or copies of many important historical documents; as, for example, in the State Paper Office, there is a collection of transactions between England, Scotland and Ireland and the Roman See, transcribed at Rome, bound up and ready for the press, beginning the first year of William the Second's reign, and continued down to the present times.

This collection I have seen; it is invaluable for the historian.

Secondly, by obtaining copies of the most important records and historical documents in private libraries, exchanging something of equal value in return.

Thirdly, in obtaining from foreign libraries and archives whatever may illustrate the laws, institutions and history of our country. And I should more particularly point out the libraries of France, and those of Denmark and Sweden, as possessed of materials most valuable for us.

Sweden, above all other countries, can furnish us the richest sources for investigating with success our ancient laws and institutions.

And this I can safely say, that no other government in Europe will so cheerfully, so ardently second the design.

Regarding printed books: There is found a constantly increasing influx of readers; their numbers begin already to crowd the present reading-rooms. Whole classes of persons now demand admittance, whose occupations during the day leave them only their evenings for study.

We have already seen that, were the hours of admittance extended much farther, no time would be left for the re-arrangement of the books in use. In truth, were the library opened for the evenings it must be shut for the day.

Without arrangement constantly preserved, no library can continue to be of use, simply because no book can be found.

Again, the library is an archive of state, a great national property. Is this property of Great Britain to be endangered by fire, or rendered useless by confusion, to accommodate the neighbouring parishes of Marylebone, Bloomsbury, and St. Pancras-in-the-Vale? This were indeed to verify the adage "of being wise in the hundred and foolish in the shire."

What then is to be done? I answer, do wisely and consult experience.

We see the German libraries find no such inconveniences where education and reading is universal. Why? They follow the simple plan of lending out books and leave the readers to study at their own fire-sides.

The

The Germans think they do enough to provide books, without providing mansions to read in.

The libraries of Denmark follow the same practice. The libraries of Scotland have always done so. The Advocates' library has lent out books to readers since its foundation in 1682.

Some of the great libraries of England, and almost all the provincial libraries, are in the practice of lending out books.

Great advantages arise; economy in buildings, fewer librarians are required, more readers enjoy the use of the library, and for longer time, and fitter leisure for study.

5154. Is not that the plan which you describe as being so fatal to the Paris library?—No. The French library has no catalogues that can be depended upon; the losses cannot be ascertained; besides, the librarians have never kept exact books of the delivery and return of volumes lent, which is indispensable for their preservation, and which is strictly observed in all the German libraries. In France the books lent circulated from hand to hand, because no precise term was fixed for their return.

In lending out books certain rules have been established, and found by experience to be effectual against loss or inconvenience.

No manuscript ought to be, nor in the British Museum can be lent out, because it is an archive; no books of engravings, or book where the engravings are of much value; no atlas nor chart; no book of reference; no rare work, nor work of which the Museum contains but the requisite copies for students within its walls.

After these deductions, a large collection would still remain that ought to be set apart from the rest of the library, and destined to be lent to readers, upon such conditions as experience has fully shown to be sufficient for their preservation; these are, that the reader be known and responsible; that the number of volumes be limited; that the time of their return be short.

Another change I beg leave to suggest in the reading-rooms of the Museum, in favour of those persons employed in the copying of maps and charts: the present tables, lights, and space in the rooms, afford no conveniences for operations so difficult and delicate. Yet it is by charts there drawn that frequently fleets sail, and the lives of our seamen depend; I suggest that map and chart makers have a room apart for themselves fitted for their task.

I suggest also, that a rule ought to be established in the reading-rooms, that the recent and lighter works in literature, as novels, plays and the like, should not be given. This is designed to exclude many, who, of late, have frequented the Museum to read such books as Tom Jones, or Scott's novels; they are generally lads, and are a great annoyance to the studious.

5155. Sir *Robert Inglis*.] You wish the library to be a library of consultation and study, not a library of light reading or of lounging?—Such is its object. Lastly, I have to propose to the Committee an increase of salary for the officers in the reading-rooms of the Museum. At present they are inadequately paid; their labours affect their health, aud several are suffering; I propose that the salary of Mr. Cates, the chief officer in the rooms, be increased to 200 *l.*, and each of the assistants to 100 *l.* a year.

5156. *Chairman*.] Do you propose that, merely for the purpose of giving those gentlemen that are now placed there, better remuneration for their services, or with the view of placing in the reading-room persons of a superior cast to those that are now employed there?—I cannot conceive that any men could be superior to them in attention and knowledge of their respective duties. I do not think that in Europe, search it through, you could find a man fitter for his duty than Mr. Cates.

5157. Does that same observation apply to the other officers in attendance in the reading-room?—To all of them; all are competent to discharge their respective duties, all uniformly obliging.

I have mentioned more particularly the officers of the reading-rooms, because they are most frequently under my observation, and their duties are the most severe.

But to every officer in the Museum I feel grateful, and consider that I do but an act of justice, thus to declare my opinion of their ability and uniform attention to the interests and service of the public.

In proof of this I may be allowed to state, that Sir Henry Ellis has on more

R. Hannay, Esq.

9 June 1836.

occasions than one adopted suggestions made by myself, the moment he was convinced they would prove of advantage to the library and the students.

No national library in Europe is so universally beneficial to its country as the British Museum; none affords to the students within its walls so many facilities for study; none where their health, comfort and tranquillity, have been so much the public care.

It is a noble monument of the wisdom, learning and industry of past times, and its influence upon the present is felt throughout society. And this is invariably found, that this great institution is esteemed the more, the better it is known.

5158. Sir *Robert Inglis.*] Without entering into the questions which you have raised about the legal value and authenticity of those documents which might be tendered in a court of law from the British Museum, or about the transfer of documents from the old offices, where at present they are legal evidence, or about the transfer from the State Paper-office of papers which at present are considered as emphatically in an office of state, or about the transfer of collections from the houses of private individuals to the British Museum, and without entering into the question of the expediency of lending books, all which questions you have raised, have you any other observations to offer to the Committee in respect to the general condition of the Museum?—None.

5159. Among the suggestions which you have offered to the Committee, you have not stated anything with respect to opening the Museum by artificial light. Is it your opinion that that ought to be done?—I have answered that in saying that it is an archive of state. That must never be lost sight of; nothing must be done with this library which endangers the general purposes for which it was founded.

5160. Is artificial light admitted in any public libraries on the Continent with which you are acquainted?—Not one in Europe.

The Rev. *George Griffin Stonestreet*, L.L.B., Prebendary of Lincoln, called in; and Examined.

Rev. *G. G. Stonestreet*, L.L.B.

5161. YOU have frequently availed yourself of the facilities which the British Museum offers to literary men?—Very frequently. I have constantly resorted to the British Museum since the year 1819.

5162. During that time have you experienced such facilities as you reasonably thought you could desire to find in consulting the printed books and the manuscripts in that depository?—I never had anything to wish for, still less to complain of. I certainly experienced a very considerable difficulty originally in obtaining admission to the Museum. It was half a year before I could obtain entrance to it; although I applied both by letter to the principal librarian, and by letter jointly to the Trustees, the interval being from December 1818 to June 1819, before I could obtain the admission. I finally received it from Sir Joseph Banks.

5163. At that time the old rule prevailed of the Trustees only giving the permission?—The Trustees personally.

5164. At present you are aware that no such difficulty exists?—No such difficulty now exists. I would contrast that difficulty with an instance of recent occurrence. A few weeks since a friend of mine, a young officer of the navy, wished to be admitted. I applied for a ticket for him, and it was instantly given to me.

5165. Mr. *Colborne.*] Could that young officer have got it without your aid?—He could not have got it without the recommendation of some person known or accredited by the librarians of the Museum. I tendered a written recommendation.

5166. Would he have found a difficulty without that?—I apprehend that the officers of the Museum would, as in other cases, have required the condition to be fulfilled, of having a recommendation, not only because it is a printed regulation, but because it would be very delicate for them to say when it should be complied with, and when not.

5167. Sir *Robert Inglis.*] You consider that some such security as the recommendation of a responsible and known party is essential to the safe preservation of the library?—Certainly.

5168. Do you apprehend that there would be any difficulty in the individual to whom you have referred having obtained from some other gentleman equally well known as yourself in London, a recommendation sufficient to introduce him to the Museum?—None whatever, upon these grounds: judging from the appearance

of

Rev. G. G. Stonestreet, L.L.B.

9 June 1836.

of persons whom I see there, I suppose there are many in very humble spheres of life, and that there can be no such difficulty to contend with.

5169. Then there was nothing special in the recommendation signed by yourself, which procured that facility for your friend?—Not at all.

5170. This facility did not exist some 30 years ago, in consequence of the then state of the regulation?—On the contrary. Although I had a brother-in-law residing in Bedford-square, and I was myself residing in Gower-street, although a clergyman, a graduate of the University of Cambridge, and resident upon the spot, still all those circumstances did not prevail against the rule of the Museum, namely, that I should privately qualify myself with a special recommendation from some particular Trustee; after finding unnecessary difficulty, I declined to accept admission but as a matter of public right, and I put the claim at length in such a position as I believe tended very much to create the present facilities; and the facilities are now everything that the public can possibly wish.

5171. What has been the average time that has elapsed between your asking for a printed book or manuscript, and your receiving it?—Exceedingly fair, I think; it is very seldom that a book required is not brought to me, and it comes soon, allowing for the pressure of demand from the increased number of visitors, and perhaps not a proportionate increase of officers and messengers; a printed book or manuscript is not brought quite so soon, I think, as formerly, but there is great order and great diligence in the establishment.

5172. The number of readers has increased from 4,300 in 1815, to 70,266 in 1834. Does not that statement itself render it probable that a much increased delay must take place in supplying the demands of the readers for a particular book or manuscript, if such delay should be found to exist?—I apprehend that it is a necessary consequence of the increase of the visitors, to retard the issue of books, unless there is a proportionate increase of officers and servants. There is also another circumstance which creates a difficulty by the increased number of visitors. It will so happen that you will have several persons applying for and waiting for the same book, and therefore a disappointment and delay sometimes occurs. I have occasionally had to wait for a book which has been said to be in such a gentleman's possession, and whose name the messenger usually signifies. With respect to the difficulty of admission to the Museum, there is still a particular restraint which I think might be properly brought under consideration; it is as to the age of the parties; the rule of the Museum is, not to admit any persons till they have attained 18 years of age. There are youths of studious habits, to whom the access would be valuable before that time.

5173. Do you consider that the library of the British Museum ought to be a library for reference, consultation and study, or a library in which parties may read generally, either for their own amusement or for their education?—I conceive that it is desirable that it should be as general as possible.

5174. Supposing you found a limited space necessarily existing, and you were to make a choice between admitting different classes, would you recommend that the favoured class should be the class of those who desire to use the library for reference, consultation and study, or the class of those who desire the use of the Museum as a reading-room?—This distinction would be attended with difficulty. A reader may be presumed to be principally occupied with his own particular studies or inquiries; and therefore I shall be extremely sorry, at a hazard, to give an opinion upon such a subject; but it has always appeared to me that the great class of readers there, are very creditably and very anxiously engaged in their several pursuits. You now and then see something in the character of a lounging man; but as far as my own observation goes, I think it is of rare occurrence.

5175. The question is, not as to the exclusion of any one class, but simply this: supposing the space were not adequate to the reception of all classes, whether the regulations ought to be rather in favour of those who resort to the British Museum as a great depository of works of reference, rare works and manuscripts, or that it should be open to those who come there for the purpose of reading mere works of amusement?—I have sometimes thought that the rooms might be classed with advantage, and by such means be more or less privileged. There are two rooms at present, as there were two latterly in the old building; there are cases where, both for the convenience of privacy and space, such arrangement might be desired.

5176. You are aware that the actual reading-rooms are rooms merely appropriated to their present purpose in the transition state of the Museum?—I am so informed.

Rev. *G. G. Stonestreet*, L.L.B.

9 June 1836.

5177. Have you had occasion to use the catalogues of the Museum library frequently?—Frequently.

5178. Does that answer refer to the catalogues of manuscripts, as well as to the catalogues of printed books?—To the catalogues of manuscripts and to the catalogue of printed books.

5179. What is your estimate of the sufficiency of the catalogues of the manuscripts?—So far as my observation has gone, they are generally very correct and sufficiently ample. An interleaved copy in the reading-room, for the immediate insertion by the proper officers, of any errors of description, and for notice, with date, of any articles missing, as they may be pointed out, is I conceive to be desired. As respects the catalogues of printed books, I think there is an insufficiency in the reading-rooms. A considerable delay is sometimes occasioned there from the want of duplicate catalogues of the printed books, with the accumulated manuscript additions; there is now only one such catalogue between the two reading-rooms. Great increase to the library having taken place since this catalogue was printed, the works described only in manuscript are constantly in demand, while there is only one record in which they are enumerated, and certainly great delay arises from the want of at least one duplicate copy, with these manuscript additions.

5180. Are you aware of any library, public or private, at home or abroad, where there is more than one copy of the catalogue for the use of the readers?—No: at home I have not seen any library that is so much frequented, or where the demand would be likely to arise.

5181. Do you know any public library where there is a second catalogue?—With such manuscript additions I do not. A new catalogue for a time will obviate this inconvenience; but it must recur soon, when it appears to me that the remedy is always in the hands of the Trustees; because it is only interleaving the volumes and setting a copying clerk at stated intervals to work, and then to determine in what part of the rooms to place the several duplicate catalogues so extended, for easier reference. This would be attended with particular advantage, because there is a great deal of unnecessary bustle in going backward and forward to consult the one particular catalogue with manuscript additions, so long as readers are obliged to make a detour of the two rooms, to the shelf upon which it is placed.

5182. Are you aware of the space actually occupied by the desk containing the single copy?—I think the additional convenience would be well worth the space so required. Duplicates of the Harleian and other collections of course would remain in the same state, because there are no additions to be made to them, neither are they so much in request. With respect to the catalogue of the printed books, of whatever number of volumes it may be, it would not occupy a space, as I conceive, amounting to inconvenience, especially as the shelves of the reading-room are now occupied by many volumes little in demand. There is some occasional confusion with the catalogues, which I think might by that means be profitably avoided.

5183. The actual catalogue is 25 folio volumes; the catalogue now in course of preparation will be 50 folio volumes. Considering the space which the desks to contain those volumes would occupy, do you consider that it is more desirable that such desks should be introduced, and duplicates of the catalogues placed thereon, than that the space should be allotted, as it is allotted at this time, to the reception and accommodation of readers?—In the case of duplicate catalogues with the MSS. additions, I know of no necessity for putting the whole alphabet, if leading to inconvenience, on the same shelf. It is easy for persons who become a little conversant with the reading-room, to know whether it is on one side or the other side that they are to look for letter F or letter M.

5184. You are aware that the existing reading-rooms are under a temporary arrangement; can you state whether those rooms, such as they are, are very full?—They appear to be constantly full; I have occasionally some difficulty in getting a seat, especially one which may require room for any research, in which many volumes are wanted.

L37

Martis, 21° die Junii, 1836.

MEMBERS PRESENT.

Mr. T. G. B. Estcourt.	Lord Stanley.
Mr. Hawes.	Sir Robert Inglis.
Mr. Thornely.	Mr. Ridley Colborne.
Mr. Bingham Baring.	Lord Sandon.
Sir Philip Egerton.	Mr. Marshall.

MR. T. G. B. ESTCOURT, IN THE CHAIR.

Mr. *Henry Josi*, called in; and Examined.

Mr. *Henry Josi.*

21 June 1836.

5185. Mr. *Hawes.*] WHAT appointment do you hold in the British Museum?—I hold the appointment of one of the assistant keepers in the department of Antiquities and Arts, and am particularly charged with the care of the prints.

5186. Practically you are responsible for the contents of the print-room?—I am responsible for the contents of the print-room; and give security for my situation there, for the due discharge of the duty, and taking care of the contents of the print-room.

5187. Will you describe your duties?—My duties are to attend in the print-room during the usual business hours of the Museum, and to take care of the works of art committed to my trust; to see that they are given out to persons who come to inspect them, or to artists who come to study from them; and to take care that they are not injured in any way; and likewise from time to time, as the Trustees think fit, to make certain additions to the collection, as they may be required.

5188. Will you state what is the salary of your situation, and whether there are any emoluments besides?—Having been very lately appointed to the situation, I believe it is 275 *l.* a year: there are no emoluments that I am aware of, except an allowance of about 5 *l.* worth of stationery per annum.

5189. Is there any catalogue of the prints or drawings?—There is a catalogue of the contents of the collection; or rather perhaps an index, which is used for reference. If any master is inquired for, by looking into that list you will find in what portfolio such works are placed.

5190. Will you describe the nature of the index?—It is written in pages, bound together: it mentions the name of the master, with reference to the case in which it is found; but there is not a particular description of any print which the portfolio may contain. There is a catalogue at present in progress, in which every print is separately described, together with its accurate place in the Museum. It is done upon the principle of the work by the well-known Bartsch, of Vienna, who has written the most complete catalogue of all these works of art known; and this catalogue of the contents of the print room is going on upon the same principle, leaving all numbers blank which do not exist in the collection, and filling-in those which do exist.

5191. By whom was that catalogue prepared?—It was commenced by myself; I began the catalogue upon that basis.

5192. Was it commenced before Mr. Ottley's time?—No, it was commenced by myself. Before I received my appointment as keeper of the prin ts, I as there as an assistant during Mr. Ottley's illness.

5193. How long have you been in the print-room?—Since the middle of February.

5194. Is the room in which you have to discharge your duty convenient for the purpose?—Yes, it is very convenient for the purpose; though I do not believe it is the room in which finally the prints will be kept: there is another situation intended for the print-room, in one of the new buildings.

5195. At present do you consider it well lighted?—Yes; I have no fault to find with the light.

5596. Is there any separate room for any occupation which may require your attention?—No.

5197. With regard to the ventilation and warming, is it satisfactory?—With

Mr. *Henry Josi.*

21 June 1836.

regard to the ventilation it is very satisfactory; and there are two round lights, which admit an excellent current of air. With regard to firing, having been there in the coldest part of the winter, the middle of the month of February, I know from experience it can be heated to any degree that can be required. During Mr. Ottley's illness I have understood that it was heated sometimes as hot as 75°; but I think it would be very injurious to keep it hotter than 60 to 65 degrees.

5198. Lord *Sandon.*] Have you need of a separate room?—I do not see that there is any necessity for a separate room, as the collection is at present.

5199. Have you any assistant?—I have an attendant, who attends to take out the portfolios under my direction.

5200. Mr. *Hawes.*] Under what restriction are visitors admitted to the print-room?—The admission is generally by bringing respectable and satisfactory references either from Royal academicians, or gentlemen connected with the British Museum, or else persons of known respectability.

5201. Sir *Robert Inglis.*] Have you ever heard any estimate of the money-value of the collection of prints in the room?—No, I have never heard what is the estimated value; but the value is very great.

5202. Lord *Sandon.*] Is it said to be 100,000*l.*?—I should think it might amount to that.

5203. Can you state what number of prints there are in the collection?—I cannot state the number; but I should think about 300,000 or 400,000.

5204. Is it complete with reference to English artists?—No, it is not.

5205. With reference to the works of Sir Joshua Reynolds, for instance?—Sir Joshua Reynolds's works are nearly complete.

5206. Has the Museum a right by the Copyright Act to each engraving published?—No, there is no Copyright Act in reference to engravers' works; such a regulation would be highly beneficial to the print-room, and particularly to it as a school of art.

5207. Lord *Stanley.*] Has there been a very valuable addition made to the collection since you entered the Museum?—Yes, a collection of a complete assemblage of the etchings by the Dutch masters, consisting of etchings of their own invention, not copies after other works. It had belonged to Mr. Sheepshanks, who devoted many years to forming that collection; and he had greater facilities than anybody can easily have again, on account of the many large collections sold during the time; it is probably the most complete collection of that school which could have been put together. It is more perfect than any similar collection existing at Vienna, or at Paris, or Amsterdam.

5208. You mentioned Bartsch's work as being the most complete that exists upon the subject; are there any etchings in that collection which have been recently purchased for the Museum, which are so rare as not to be known even to Bartsch?—Yes, there may be perhaps 300.

5209. Of those which were known to Bartsch, how many do you suppose are not to be found in that collection?—About 40.

5210. The Museum did not purchase the whole of Mr. Sheepshanks's collection; for example, the Rembrandts?—No, the Trustees did not, for we had got a very extensive assemblage of Rembrandts; but the offer was made for a complete collection of the Dutch school, or in other words, of the etchings in the first five volumes of Bartsch.

5211. Do you happen to know that of the Rembrandts which were not offered to the Museum, the Museum itself possessed a very rich and perfect collection?—Not perfect, but very rich; it is impossible to have a perfect collection of Rembrandt, for there are so many extremely rare, and even unique, different states in the etchings of Rembrandt, some of which are dispersed in various national or otherwise permanent collections.

5212. Sir *Robert Inglis.*] Will you state the number of volumes, and the number of engravings contained in them, in the Sheepshanks' collection recently added?—There are about 8,450

5213. Does that include the drawings?—That includes the drawings and engravings.

5214. How many drawings are there?—About 800.

5215. Original drawings by the same masters?—Yes.

5216. How many volumes?—Twenty-one volumes bound in red-morocco, and 10 or 11 volumes which are not bound yet.

5217. Mr.

5217. Mr. *Hawes.*] When is the catalogue likely to be completed?—It will take some time to complete it in the way in which it ought to be done.

5218. Assuming that you have no other assistance than that which you now have, in what period is it likely to be completed?—I should think it might be much advanced in about a couple of years, at least as regards the principal schools of the classed catalogue; at present I am engaged upon a regular inventory of the collection. I have formed nearly a complete catalogue of our early German school; the making a catalogue of the Sheepshanks' collection will take a long time, but in the course of a couple of years great progress may be made in the classed catalogue.

5219. Do you attach great importance to the making of a catalogue?—Very great importance indeed; in a collection of prints, I consider it of infinite consequence.

5220. Do you look to the publication when complete?—I do not look to the publication of the catalogue of the Museum; I have been some years engaged in writing a supplement to the work of Bartsch.

5221. Would the catalogue, when you have completed it, be fit for publication, and would it be useful to publish it?—I think it might; but in the way in which I make the catalogue, it would always leave an hiatus for those prints we do not possess at present, which I hope will be filled up in the course of time; I take all the works of the masters, and leave a place open for any print that we have not got, so that we may be able to write the print in its proper order.

5222. You have stated that you are making an inventory; was there no inventory when you were appointed?—There was an inventory made by Mr. Alexander many years ago, which I found very defective.

5223. The list of the prints has not been continued as additions have been made?—No, not in that inventory.

5224. With reference to the exhibition of prints and drawings, is the mode in which they are now exhibited such as to prevent their being injured?—As much as it is possible to secure that point. Of course drawings which are mounted upon boards and drawing-paper, cannot be bound into books. In the books, the perfect preservation depends much upon a careful turning of the leaves, which is not done in quite so satisfactory a manner as it is in other countries. If you go to Paris, you see the middle classes or the lower classes sitting with the books before them, and they will turn the leaves with the greatest possible caution, whereas with us even artists and collectors will turn over the books with very great carelessness; and I believe most printsellers would say the same in reference to their portfolios.

5225. Is there any suggestion you can make to prevent the effect of that carelessness?—I do not know any, except requesting them to be as careful as possible.

5226. Would an additional attendant be any additional security?—No, I do not think it would be of any service.

5227. Lord *Sandon.*] Unless an attendant were allowed to turn the leaves?—It would be impossible; we should be obliged to have an attendant for every volume in use.

5228. Is the collection much consulted?—Very much so; especially by artists and young rising students. A great number come there for good engravings; they study the different prints there, and apply to take parts to assist them in their compositions.

5229. About what number of persons in a day frequent the print-room?—Sometimes six or seven artists or students work, besides parties that come to view the prints cursorily as amateurs.

5230. *Chairman.*] Is the study and examination of the prints carried on in the room in which they are kept?—It is; the room is a closed room.

5231. Have you heard complaints on the part of the public in reference to the admission to the print-room?—There have been complaints made during the last two years, which arose principally through Mr. Ottley's ill state of health, because he was not able to attend; from the immense value of the collection, it would not be proper to entrust the keys into the hands of a common assistant.

5232. Then those complaints arose entirely from the indisposition of the then keeper of the prints?—I believe so.

5233. And such will no longer exist now you are appointed to the room?—

Mr. *Henry Josi.*

21 June 1836.

Certainly not; in fact, since I have been there, there has been a great addition of students and visitors.

5234. The falling-off in the number of visitors is mainly to be accounted for by the illness of the late keeper, Mr. Ottley?—Yes.

5235. Lord *Sandon.*] Are you acquainted with the Vienna collection of prints?—I have seen it.

5236. What is its value and condition, compared with that of the British Museum?—It is more perfect than our collection.

5237. It is even more perfect in regard to English prints than the British Museum?—Perhaps it is; but I cannot speak upon that point.

5238. Are you acquainted with the number of the prints in the Vienna collection?—No; but it is very extensive.

5239. Much more extensive than ours?—A great deal more so.

5240. Are you acquainted with the regulations under which the print-room is shown to visitors?—Not at Vienna; whenever I have visited foreign museums, I have not made it my business to inquire, having always had admission by merely going into the print-rooms; but at Paris I know the regulations are nearly similar to what they are with us, that is, in the inner print-room, where the precious prints are kept. There are two or three rooms where the more common prints are kept. Anybody can see those; but to examine the collection critically, in its more valuable details, requires special permission. The mode of admission there is through an introduction from some respectable person to the keeper of the print-room.

5241. Mr. *Hawes.*] With reference to the Paris collection, what should you say of it compared with the British Museum?—It is considerably more numerous and rich; but you have to consider that that collection was largely formed in the time of Louis XIV.; and in the early part of the 18th century there were more opportunities of buying prints than at any other time that has occurred since. Their collection of Rembrandt was formed, I believe, in the early part of the 18th century.

5242. Lord *Sandon.*] Do you know the circumstances under which the Vienna collection was formed; was not a great part of the collection Prince Eugene's?—A great proportion of it was.

5243. Mr. *Hawes.*] The head of your department is Mr. Hawkins, the keeper of antiquities and arts; can you assign any good reason for placing the prints under the nominal care of the head of the keeper of antiquities and arts?—I do not see any particular reason why it should be so, except that the fine arts and prints are closely associated together; the head of that department can have the minor department under his superintendence.

5244. Does Mr. Hawkins exercise any superintendence over the collection of prints?—Yes, he does; I look upon him as my superior officer.

5245. What does he do in reference to the collection of prints, either as to their care or custody?—I consider myself responsible to Mr. Hawkins for the due taking care of the prints under his regulations. When I first came to the Museum there were certain keys of Mr. Ottley's sent, and I considered myself bound to go and receive Mr. Hawkins' directions upon the subject.

5246. What directions did you receive?—To deliver the keys back into his hand.

5247. That was the whole?—Upon that occasion.

5248. Then, practically, that is the amount of the superintendence exercised by Mr. Hawkins over the collection of prints; and Mr. Hawkins does not interfere either with their custody or their exhibition?—No, not generally, being in his own medal-room.

5249. Then it is a mere nominal superintendence?—It is a practical superintendence, for he has a right to come and look over the cases and see that they are properly kept.

5250. A right which he does not exercise?—Since I have been there he came and spoke to me on the subject, when the Sheepshanks' collection was purchased.

5251. That was a new collection?—Yes; I had been there so short a time that I can not say what may have taken place previous to my appointment.

5252. Lord *Stanley.*] Can you suggest any means by which greater facility could be afforded to the public, with safety to the prints, than is afforded at present?—I do not think it is desirable to afford greater facility to see the

prints critically than is afforded at present, because as many as wish to see the prints have an easy mode of getting an introduction; and, when they come, every facility is given to every applicant to see what he wants.

5253. Lord *Sandon.*] Every foreig ner would have access through the means of his consul or ambassador?—Yes.

5254. Lord *Stanley*] Do you conceive that the facilities afforded in the British Museum are equal to those afforded by most foreign collections?—I should think so, as to the precious part of those collections.

5255. Lord *Sandon.*] Do you think that some of the common prints might be shown with greater facility?—Perhaps they might; but we have not many common prints.

5256. In foreign countries, is there any copyright regulation as to prints, which ensures to the public collections a copy of each print?—I am not sure whether such a regulation has not been made in Paris lately; but it does not exist in Holland, I know. Foreigners have every facility with us; and I have always observed when they come to the print-room they take very great care of the prints, and are more particular in the turning over the leaves than any of our own visitors.

5257. Have you any annual allowance allotted for the improvement of the collection?—There is an allowance allotted, I believe, from 250 *l.* to 300 *l.* a-year.

5258. Will that annual allowance, constantly going on, enable you in time to perfect the collection?—Having that to lay out at my own discretion will considerably improve the collection; but there are many opportunities when small collections might be bought at 400 *l.* or 500 *l.*, which would considerably increase the present cabinet, for which the money ordinarily allowed would not be sufficient.

5259. You would think it your province, in such a case, to make a special report to the Trustees?—Yes; as in the case of the Sheepshanks collection. When I understood that Mr. Sheepshanks had sold it; that it was going out of the country, and that there was a foreign offer made for it, larger than it was afterwards offered for to the Museum, I immediately represented the matter to the Trustees, and they called a special meeting upon the occasion, and promoted the purchase as much as possible.

5260. The Trustees have no means of making a purchase on the Continent, have they?—Not that I am aware of; but of all large collections that are sold on the Continent, the catalogues always come over to England.

5261. Have you occasionally made, or have the Trustees occasionally made purchases upon the Continent from those catalogues?—I cannot say, from my own experience; since I have been there, no opportunity has offered.

5262. Lord *Stanley.*] You are acquainted with many of the principal collections upon the Continent?—I am. I have been initiated into the study of prints from my earliest youth.

5263. The only recommendation you have made to the Trustees was at once complied with?—It was.

5264. Mr. *Hawes.*] Is there any collection of drawings of the old masters under your care?—A very excellent collection; the collections of Mr. Cracherode and of Mr. Payne Knight.

5265. What is the number of which they consist?—The Payne Knight collection consists of 15 portfolios, and in each portfolio there may be about 100 drawings; the Cracherode collection consists of seven portfolios.

5266. Are you aware of the value of those two collections?—No; but I could, in a few days, make a hasty valuation of them.

5267. Lord *Stanley.*] Is the collection which has been recently purchased accessible to the public?—Not at present; it is sealed up by the direction of the Trustees, on account of the money not having being paid.

5268. In point of fact, it is not at present the property of the Museum, although the prints are left there upon the understanding that they will be paid for?—No; I believe it may be considered the property of the Museum, for I have got a minute directing me to place it under my own seal and the seal of the seller, until the money is paid.

5269. Sir *Robert Inglis.*] But till the money is paid, the seal of the seller cannot be removed?—No; but the seller did not wish to have his seal placed on.

5270. Mr. *Hawes.*] What was the date of your appointment as keeper of the prints?—The 8th of June.

Jovis, 23° die Junii, 1836.

MEMBERS PRESENT.

Mr. T. G. B. Estcourt.	Sir Robert Inglis.
Lord Stanley.	Lord Sandon.
Mr. Compton.	Mr. Ridley Colborne.
Mr. Thornely.	Mr. Bingham Baring.
Mr. Hawes.	Sir Philip Egerton.

MR. T. G. B. ESTCOURT, IN THE CHAIR.

Sir *Robert Smirke*, called in; and Examined.

Sir *Robert Smirke.*

23 June 1836.

5271. Mr. *Hawes.*] YOU are the architect of the new buildings of the British Museum?—I am.

5272. Have you been so from their commencement?—I was appointed architect to the Museum in 1815, before their commencement.

5273. By whom were you called upon to furnish plans for the new building in the first instance?—I received a letter, early in the year 1821, from the Surveyor-general of the Office of Works, stating that he was authorized by the Lords of the Treasury to employ me to prepare those plans, and referring me to the Trustees for my instructions for that purpose.

5274. Before you began to prepare those plans did you seek instructions from the Trustees?—Certainly; there was a committee of the Trustees appointed to communicate with me upon the subject of the plans.

5275. Who were the members of that committee?—Lord Farnborough, then Sir Charles Long, Lord Aberdeen, Lord Spencer, Mr. Payne Knight, and Mr. Bankes.

5276. Will you state the nature of the instructions which you received?—The object of the Trustees, in the first instance, was to erect buildings upon the eastern side of the quadrangle, for the purpose of receiving a part of the collections, which were very inconveniently preserved in the old building; but before the plans were completed, a question arose about the right of building upon the ground north of the old building, by which the progress with them was suspended for a considerable time, till the case had been heard before the Court of Chancery, and it was decided that they had the right.

5277. When was that decision pronounced?—It must have been about the latter end of 1822. Shortly after that, an intimation was given of the intention of his late Majesty to present to the Museum the great collection of books made by George the Third. That altered the views of the Trustees as to the extent of the building then required, and plans were made to show in what manner this collection of books could be received, together with the other objects which had been specified, and also to show to what extent the buildings might eventually be carried upon the whole ground, adopting a uniform design for their exterior. About the same time there was a Committee of the House of Commons appointed to inquire into the subject and to sanction the proposed arrangements for receiving the King's Library. The plans were laid before them and were examined, but they were then in a very imperfect state. Subsequently the Trustees approved of the general arrangement described upon these drawings now before the Committee, and they were then submitted to the Lords of the Treasury, by whom the general design and arrangement were sanctioned, and directions given for the erection of the east wing, for which an estimate was made. The remaining parts of the building were to be the subject of future reports and estimates, whenever it was decided in what manner they should be appropriated and finished.

5278. Did the trustees give you any instructions as to the amount of accommodation, or the peculiarity of the accommodation, required for the collection of the Museum?—No detailed instructions were given for the general collection of the Museum, the object at that time being to provide only for certain collections in an eastern wing. The remainder of the plan showed in a general manner the extent and arrangements proposed for the buildings.

5279. But

Sir *Robert Smirke.*

23 June 1836.

5279. But confining the inquiry at present to the east wing, the plan of which you submitted to the Trustees, and was adopted by the Treasury, and from which the estimate was formed, did the Trustees give you any special instructions as to the internal arrangement, or give you any general ideas as to the accommodation that might be required?—Certainly.

5280. Will you state the instructions you received?—To provide a room capable of containing the whole number of books presented by the King, on the ground-floor. In addition to which, I was to provide for the manuscripts, and for readers frequenting the library. Upon the first floor it was proposed that the national collection of pictures should be placed, and my instructions were to prepare that, and construct the roof so that the pictures should be lighted from it, in a manner described by the Trustees, but capable of being altered afterwards, if the pictures should be removed at a future time to any other part of the buildings.

5281. Was the room now called the King's Library then built for the purpose of containing the national collection of pictures, or for the reception of the books of the Royal Library?—It was built for the Royal Library, and the room over it was proposed to receive the collection of pictures, and it now contains the mineralogical collection.

5282. Then the east wing was built for the purpose of receiving the Royal Library, and the national collection of pictures and of manuscripts; and a plan for that purpose was submitted to, and approved of, by the Trustees?—Yes.

5283. Was an estimate made of that wing?—There was.

5284. Were the works undertaken by contract?—They were.

5285. Was it by tender?—It was.

5286. By public advertisement?—Not by public advertisement, but by tenders received from a number of tradesmen selected to give them. These arrangements, and everything connected with the valuation of the works and making up of the accounts, were under the management of the Board of Works.

5287. But of which you are a member?—I was attached to that office; but it does not exist at this time.

5288. Did the Board of Works in any way interfere with you as the architect of the British Museum?—I was employed by that office, under the appointment of the Lords of the Treasury, to prepare plans for the buildings which were proposed to be erected at the Museum, and to direct the execution of them; but the management of the accounts, and of everything connected with the expenditure, was entirely under the control of that office.

5289. Who is to be considered responsible for the due execution of the works?—For the due execution of the work I am responsible. I directed the construction of the work; but I had nothing to do with the accounts.

5290. Who prepared the specifications for the contractors?—I did; and my specification was delivered to the Office of Works to be contracted for.

5291. Will you explain how they made contracts?—They selected a certain number of the most respectable tradesmen of different branches of work, and received tenders from them.

5292. It is not done, therefore, by public advertisement, but by competition amongst individuals selected by the Board of Works?—Yes.

5293. Who is the contractor for the buildings now executed?—There have been many contracts made: the first were for the east wing. Different branches of work were contracted for by different tradesmen connected with those branches of work.

5294. Will you state them?—Messrs. Baker were contractors for part of the work, with Messrs. Foster and Rastrick, Palmer, Dixon and others.

5295. Were Messrs. Baker the principal contractors?—They contracted for all the masons', carpenters' and brickwork. The north wing has been built by Messrs. Lee, who had the contract for the whole of the carcass of that building. Perhaps I should state to the Committee, that the arrangement now in regard to the superintendence of the public buildings rather differs from that of the late Office of Works. Since the year 1832, when that office was abolished, they have been placed under the Commissioners of Woods, by whom I am employed to conduct the works at the Museum; and now I have to make up the accounts and to superintend that part of the work, as well as the construction of the building; but the Commissioners of Woods make the contracts as before, and give me the names of the parties whose tenders they accept.

Sir *Robert Smirke.*

23 June 1836.

5296. Lord *Stanley.*] Over the execution of the work, in the manner in which you have described, the Trustees of the British Museum exercise no control whatever?—None whatever.

5297. The duties which were assigned to them were limited to a previous approbation of the general plan upon which you propose to proceed?—Yes.

5298. Of course, in the progress of the work, you from time to time consulted with the committee of Trustees whom you have mentioned, with regard to any of the details which struck either you or them in the progress of the work?—Yes. In the year 1829 the Trustees applied to the Lords of the Treasury to be authorized to communicate with me directly with regard to the details of the work as it proceeded, finding some inconvenience in sending to the Surveyor-general of the Office of Works for me, when they required to communicate with me; the Lords of the Treasury gave them that authority, and desired that I should attend to their instructions; but, at the same time, desired that it might be distinctly understood no order should be given by the Trustees which would increase the expense of the work, or which would alter the character of the design for the exterior, that had been sanctioned by their Lordships.

5299. Then, previous to 1829, the Trustees had not even the power of communicating directly with you with reference to details?—Not officially, after the plans had been sanctioned, except through the Office of Works.

5300. And inconvenience was found to result from the want of such power in the hands of the Trustees?—So I understood.

5301. Even when the power was given to the Trustees, they were still limited so as to make no alteration which should entail increased expense, or alter the original design of the exterior?—Yes.

5302. By the direction of the Treasury, then, the accommodation of the interior was made secondary and subservient to the general arrangement of the architectural design?—So far only as regarded the part of the exterior which was to be presented to public view, the south front, and the interior of the quadrangle.

5303. At that time had any detailed plans been submitted for finishing the north and the west wing?—No detailed plans.

5304. Consequently, when the Trustees had to make their arrangements with regard to the north and the west wing, they had to make them entirely with reference to the pre-arranged plan, from which they were not at liberty to depart?—It was so.

5305. Mr. *Hawes.*] Are the Committee to understand that the interior arrangement was made subservient to the external design?—The interior arrangements of every part of the building, except the east wing, were made only to show the general extent and arrangement proposed for the buildings: the appropriation and subdivision of them into the different departments, and all the more detailed arrangements, were to be made whenever those buildings were to be erected.

5306. In fact, having built up the walls, and determined the design, the arrangement of the interior was left for subsequent consideration?—No part of the building, nor any walls, were erected till the interior of that part had been fully considered in detail.

5307. Lord *Stanley.*] Not erected, but designed?—Designed.

5308. And from that design, by the special direction of the Lords of the Treasury, the Trustees were not at liberty to depart, for the greater convenience of internal arrangement?—Not without submitting their opinion to the Lords of the Treasury, if increased expense would be incurred.

5309. Could any material alteration have been made in the arrangement of that north and west wing, after the east wing was finished, without altogether destroying the architectural effect of the whole original design?—Yes; there was a material alteration made in the north wing, and for which special application was made to the Lords of the Treasury.

5310. But the question refers to the arrangement for the lighting; no alteration could have been made without entirely affecting the whole architectural character of the building?—Certainly not.

5311. The east wing having been built upon a plan, the exterior of which was to be accommodated to the purpose for which the interior was destined, the remaining buildings were formed in conformity with that architectural plan,

plan, and their internal arrangements had to be accommodated to the architecture of the exterior?—Not entirely; because, at the time the original plans were under consideration, there was a general arrangement considered and sanctioned for those buildings: the west wing was proposed to have the galleries which are now built; the north wing also was proposed to have galleries in the same manner nearly as they are now built; but each part successively, as it was ordered, underwent a detailed consideration. That detailed consideration was not given, nor thought necessary, when the plans were originally made.

5312. Mr. *Hawes.*] But you have stated that the interior was fully considered before the plan and the design were agreed upon?—No part of the interior received detailed consideration at that time, except the east wing. The plan only showed the practicable extent of the buildings, and the general arrangement which might be adopted when it should be found desirable to erect them.

5313. Then are the Committee to understand that the particular accommodation required for collections like those contained in the British Museum generally, was not considered in the first instance, before any design was matured in your mind?—These plans now upon the table show how far they were considered. They were considered as to the general arrangement and the practicability which the site afforded of providing for such an establishment. At the time when these plans were made there was no distinct idea as to the extent to which the buildings would be carried. Their ultimate extent, and the provision to be made for the several departments, depended upon the disposition of the Government, and the interest that might be taken by the public in the collections as they were formed or increased, which no one connected with the establishment could then foresee. This interest has increased in a degree far beyond the expectation of the Trustees and officers in every department. At the time when these buildings were first under consideration it was stated to me by one of the principal officers of the Museum that the average number of readers daily attending the rooms was 30. He stated, at the same time, that he thought it probable, if more convenient arrangements were made for their reception, they might be increased to 80, or even perhaps 100. There are now frequently 200, and yet more accommodation is wanted. I mention this to show how imperfectly we could foresee the extent to which the establishment would be increased, and that the plans therefore could only be made to show the Government that there was a capability of extending it very considerably.

5314. The object of the question was to ascertain whether you maturely considered the extent of the collections, and the peculiarity of those collections, before you determined on your plan and design?—There were no complete collections formed, nor could any one state to what extent any of the collections might increase.

5315. But the plan of the east wing was intended to be a portion of the whole plan?—It was.

5316. Now supposing an extensive alteration were to take place in the architectural design of the east wing, will you state in what way that would be injurious to the building, keeping in mind that the only portion of the east wing which is visible to the public is the outside, which is merely a high brick wall?—I must know what species of alteration would be required, before I can answer that inquiry.

5317. Is any portion of the interior quadrangle intended to be visible to the public?—It is.

5318. The plan before the Committee is a plan of the proposed buildings. Now when that plan is completed, from whence will the public have a view of the architecture of the interior quadrangle?—When they are in the quadrangle.

5319. Will they be admitted into the quadrangle?—I conclude that they will.

5320. For what purpose?—There are entrances in the quadrang e each end.

5321. Were those entrances part of your original plan?—Not in the situation in which they are here, but under the portico.

5322. It was always intended that the public should have free access to the interior

Sir *Robert Smirke.*

23 June 1836.

interior of the quadrangle?—Yes; a great flight of steps ascended to the centre portico, on the north side of the quadrangle.

5323. According to the present plan, which has been altered in reference to the portico in question, what portion of the public will have access to the interior quadrangle, and for what purpose?—All those who desire to have access to the departments in the north wing without passing through the other departments.

5324. That access is still continued in the present plan, but no longer under the portico, as originally intended, but by side doorways, made subsequently?—Yes.

5325. Where will be the principal entrance to the collection of the Museum?—In the centre of the south front.

5326. From that centre will there be given to the public the principal entrance to all the collections?—There will.

5327. Then for what purpose is the resort to the second entrance by this small door?—They may desire to go to a department contained in the north wing, without going circuitously through the other departments.

5328. Sir *Robert Inglis.*] May not there also be persons desirous of reading, and of reading only?—There may, and others may desire to go to the King's Library without passing through the department of manuscripts.

5329. Mr. *Hawes.*] Then do you propose to have several public entrances to the different collections?—Only one general entrance, and two internal entrances from the quadrangle. It is also proposed that the readers should have access to the reading-room from Montague-place, on the north.

5330. By the readers, you mean those that have regular tickets to the reading-room?—Yes.

5331. Do you propose to give the public access at three different points?—All, except the readers, must pass through the entrance hall before they can go to the secondary entrances.

5332. Do you think practically that that system will be adopted by the trustees of allowing three points of access to the public to go to the collections?—The persons entering the great hall will there give their names, and do that which all are required to do upon entering the Museum: they may then go to any part of the building, either through the quadrangle or through the other rooms.

5333. At present these small doorways, being part of your subsequent plan, are somewhat smaller than the windows above them, are they not?—There is a trifling difference; but it is very little.

5334. Those being the access for the public, do you think it desirable that the doorway should be so inferior to the windows above?—I made them as I thought best for the design of the building.

5335. Lord *Sandon.*] What would be the width of those doors?—Nearly six feet.

5336. Mr. *Hawes.*] In the preceding part of your examination you have used the phrase, that the interior was fully considered; by whom was it considered, and what was the nature of the consideration given to it?—I do not recollect using the words fully considered, except as it applied to the east wing: that part was fully considered. The officer in charge of the manuscripts gave his opinion as to the accommodation required for them; and I will mention the opinion he gave me, in order to show how imperfectly he could foresee what might be required. That officer, who had then been many years in the Museum, gave me a very accurate account of all the manuscripts, and the space they occupied: he told me at the same time that two rooms would be required, one a study for himself, and the other for his colleague, and that there was only one attendant. He added at the same time, (and I speak from notes that I made of the information he gave me at the time, in 1821); he added, it was not likely that the additions to the department would be great, but that I should provide some additional room. That department is, however, now already increased one-fourth, and instead of one attendant, there are three attendants and six gentlemen (assistant officers) constantly employed there; so that it must be seen how very imperfectly even the principal officers attached to the departments could foresee the increased extent of accommodation that might be required.

447

Sir *Robert Smirke.*

23 June 1836.

5337. Who was the principal officer at that time?—The gentleman who is now the principal librarian, Sir Henry Ellis.

5338. When were you first applied to to give in plans for the remainder of the buildings, or any portion of them?—It was in the year 1826 that the detailed plans and estimates for the west wing were formed. When it became necessary to remove the Athenian marbles from the temporary room which had been built for them, and to provide room for the Egyptian antiquities, the Trustees applied to the Lords of the Treasury for permission to proceed with the erection of the west wing, and accordingly that plan was then made.

5339. That is to say, the detailed plan?—Yes; and in the latter end of the year 1831 the Trustees again addressed a memorial to the Lords of the Treasury, describing the extreme inconvenience felt in the old buildings with regard to the collection of printed books, and the impossibility of receiving any additional collections, as well as the insecurity of the building; and desiring, for these reasons, to have the north wing built. The plans of the north wing were then made, and underwent that detailed consideration which I have described with reference to the other parts of the building.

5340. The detailed plans you speak of in 1826 were those for containing the Egyptian antiquities?—The Egyptian antiquities and Greek marbles.

5341. What were the plans for, that were made in 1832?—For the printed books.

5342. Did you give in detailed estimates in 1826 to the Board of Works?—I did; and an estimate was given, either in 1832 or 1833, to the Commissioners of Woods, for the north wing.

5343. Was there no general estimate delivered in?—None. The original minute of the Lords of the Treasury sanctioned only the estimate for the east wing, and required, that before any other parts were built, the detailed plans and estimates of those parts should be submitted to them.

5344. Then the estimates have been only formed from time to time of portions of the buildings, as they have been required?—Yes.

5345. What was the estimate of the north wing?—£. 70,000. This estimate included the fitting up of the interior of the north wing with the bookcases to receive the books; but as the appropriation of the upper floor was not decided, it was stated in the estimate that the expense of the cases and the fittings required for those upper rooms was not included.

5346. The east and west wings were more expensive than the north wing?—They were.

5347. What was the cause of that?—It was a much larger building.

5348. But not necessarily more expensive because larger?—The expense would be increased nearly in proportion to the greater extent of building.

5349. But the north wing involved the portico?—The estimate was given for the building without the portico: there was no portico in the plan as finally adopted.

5350. When the contracts were made for the subsequent portions were any means taken to give publicity to them, so as to obtain them on the most advantageous terms?—Those arrangements were wholly under the control of the Commissioners: I had nothing to do with them, farther than to give specifications of what was to be contracted for. At the same time, I may state that I recommended to them to adopt the same course as that which had been adopted upon former occasions, and that a certain number of respectable tradesmen should be sent to for the purpose; and I know that that course was adopted.

5351. Can you state the expense of the granite columns in the library?—I cannot.

5352. Can you give any rough calculation as an approximation to the cost?—I am quite unable to state it; I have no recollection of it; but they were very expensive.

5353. Are they intended merely for ornamental purposes?—No; they support the floor of the gallery above, and the walls rising to the roof are built upon them.

5354. On account of the widening of the library in this part, and merely on that account?—On that account.

5355. *Chairman.*] Supposing there had been no granite columns there, would it have been necessary to have placed pillars of iron, or some other supports, in the situation in which those granite columns are?—Certainly. I had esti-

Sir *Robert Smirke.*

23 June 1836.

mates made of iron columns, but I found the expense of them would be great; and, considering the very inferior quality of that material for such a situation, I decided upon the granite columns, knowing that they could be provided without causing any excess in my original estimate.

5356. Mr. *Hawes.*] Can you give any idea of the difference of expense between the iron columns and the granite columns?—The difference was very great, but I have no recollection of it.

5357. Is it intended to apply the lower parts, or basement of the building, to any purposes connected with the Museum?—In some part of the building it is.

5358. Are they constructed particularly for any useful purpose?—Particularly so in the north wing; and part of the west wing is already applied to very useful purposes: the bookbinders are there, and there is a gallery fitted up for those Egyptian antiquities which are not to be placed in the upper rooms.

5359. And care has been taken therefore to keep them in a perfectly dry state?—I have taken the greatest care I can.

5360. Are you acquainted with the plans of any foreign libraries or museums?—I am.

5361. Did you consider them previously to laying down your own plan?—I did; but there are none of the same description as the Museum in regard to the proposed extent and variety of the collections in them, and some of the best were not then built. The great buildings at Berlin and at Munich were not then erected.

5362. What public buildings do you refer to?—I refer to the great Museum, or Gallery of Arts, at Berlin, which is built to contain sculpture and pictures. The only library I had seen possessing any character of architectural importance was the Imperial Library at Vienna, which is a room about 230 feet long, and infinitely more expensive and magnificent in its decoration than any room in the Museum here.

5363. Is there not a mode in your profession of cubing the contents of a building, and giving the cost per solid cube, so as to form a comparison with other buildings?—It would be a very fallacious mode of making a comparison. I have heard that it is done, but have never relied on it myself.

5364. You never cubed the contents of the buildings of the British Museum, and estimated the cost per cube?—No; nor would it be possible to form any fair opinion whatever by that means: the expense of a building depends upon the manner in which a building is constructed, and the purposes for which it is built.

5365. Have you ever consulted the officers of the Museum in regard to the accommodation they might require for their respective collections?—Frequently.

5366. Can you name the officers whom you have so consulted at any period since the commencement of the buildings?—I have been at different times in communication with all the principal officers. When the building was first under consideration, in 1821, I was personally acquainted, and had frequent intercourse with them, and received from several of them the best opinions and information they could give, and quite sufficient for the purpose then in view, which was the general arrangement of the buildings. It has also been the practice of the Trustees, when the plan of any part of the building has been submitted to them, to refer it to the officers for their opinions upon it; and those opinions were communicated to me, if the Trustees thought that they required any alteration or reconsideration of the plan.

5367. Was it made a matter of business between yourself and the officers?—Not officially.

5368. Then voluntarily on your own part, did you consult the officers, and ascertain what was required for the collections under their care?—I have been in frequent communication with them for that express purpose, but not officially; therefore I could have only that information which they were disposed to give me, and, generally speaking, they were disposed to give me the utmost.

5369. Who were the officers whom you more frequently consulted?—In the early part of the work, with the gentleman who was then the chief librarian, whom I had known for many years (Mr. Planta), and also with Sir Henry Ellis

449

Sir *Robert Smirke.*

23 June 1836.

Ellis and Mr. Baber, and with Mr. Combe also, who had charge of the department of antiquities.

5370. Have you consulted Mr. Hawkins, for instance, the present keeper of antiquities?—Repeatedly.

5371. Has not he suggested alterations in your plan after it has been executed, and have not those alterations been made?—I do not recollect any instance.

5372. Did you consult Mr. Children, in the natural history department?—He was not attached to the natural history department at the time these plans were made.

5373. Have you consulted him at all?—I have on several occasions.

5374. Has he suggested alterations which were made after the plan was executed?—I recollect none; I recollect his opinion being taken upon the appropriation of the upper rooms of the east wing, and his expressing a strong wish that the Trustees would place the collections of zoology, which were under his particular department, in that room. The principal officer had made objection on account of the skylights. Mr. Children stated to me that he had put up cases containing those objects in his department, in a temporary manner, and found the light exceedingly well adapted for them.

5375. Then was not that an alteration made after the plan was executed?—There was no alteration made; the rooms were not finished and appropriated until after it was determined that the National Gallery for pictures should not be in the Museum.

5376. Mr. Hawkins was asked in his examination of last year, in question 3540, whether the original plan had been altered at all, to accommodate it to the exhibition of the antiquities of the department. He says, "Yes; the rooms that are at this moment fitting up were originally intended to have been one room, and it was to have been lighted in a different manner; the lighting and division of the room have been since made, partly at my suggestion, or at least after consultation with the secretary and others"?—That answer refers to the upper room of the west wing, which had been left unfinished. It was left as one room, to be subdivided or otherwise, as might be found necessary. The skylights were not made, the openings for them in the roof being covered in a temporary manner; and when he suggested the arrangement which is now made, it was adopted, but there was no change; nothing had been done in the rooms till he suggested that arrangement of them which has been adopted.

5377. Lord *Stanley.*] There was a change from the original design, but no change after the room had been built?—In the original design it was left as one open room, to be divided or appropriated as might be found desirable, and so it remained till Mr. Hawkins, about two years ago, suggested the present arrangement for finishing the room in three subdivisions.

5378. Then the plan was accommodated to the wishes of the officers of the department, but without any alteration in that which had been already constructed, without any undoing and doing again?—Without any.

5379. Sir *Robert Inglis.*] The carcass of the building having been formed upon the plan determined and sanctioned by the Lords of the Treasury, the subdivision into floors and the subdivision into rooms was a matter of subsequent consideration, and was determined upon consultation with those who were more particularly interested in the collections which were to occupy the rooms?—It was so; and in the case before referred to the arrangement was determined by the Trustees with Mr. Hawkins.

5380. Mr. *Hawes.*] Your attention is requested to the following questions put to Mr. Children, and his answers: "Do you not think it ought to be, in any future arrrangement, the object to make the collection of the animal kingdom in the British Museum coincide with these views?" The answer is, "Certainly." The next question is, "Can you anticipate that you will be able to realize these views without any knowledge of the arrangements making by the architect?" The answer is, "It would be more desirable to know them exactly. I cannot tell, from any information I at present possess, what space will be allotted to us. I believe that side windows have been determined on instead of skylights, in consequence of an opinion I once expressed to the secretary, Mr. Forshall, of the superiority of the former"?—I do not exactly know to what that refers, but I can state that the plans of the north side of the building, both the ground floor and the first floor plans, were directed by the

Sir *Robert Smirke.*

23 June 1836.

Trustees to be submitted to the chief librarian and the principal officers of the printed books and natural history departments, for their opinion. I know this was directed by the Trustees, because their minute to that effect was communicated to me, with an account of some of the opinions that had been given.

5381. At what date was that?—In 1833. Mr. Children has since reported to the Trustees to what extent he thinks his department could be extended as to the collections; this also has been communicated to me, and I am prepared to show that the buildings, as they are constructed, will provide considerably more than he anticipates will be required.

5382. When was that report of Mr. Children's made?—The latter end of last year.

5383. Subsequently to his examination before this Committee, which was on the 27th of July 1835?—Yes; the last report I allude to was made in December 1835. The first report was in March 1833.

5384. And subsequently to July last year, Mr. Children has been consulted by the Trustees or by the architect, for the purpose of making suggestions with reference to the arrangement of the building to receive the collection?—If by the question it is implied that he was not consulted before, I beg to remind the Committee that I have stated he was consulted by the Trustees in regard to the arrangements in 1827 and in 1833; for some of the opinions he gave were communicated to me, and I had also conferred with him myself upon the subject.

5385. The following answer was given by Mr. Children upon this very subject on the 27th of July 1835, in answer to the question 3384, in which he states, "I have seen the plans of Sir Robert Smirke in the secretary's hands, but I was not consulted by the Trustees nor by the architect as to any suggestions for the arrangement of the zoological collection." Must not there be some mistake on that point?—I can only repeat what was communicated to me by the minutes of the Trustees before referred to.

5386. Was any objection taken to it as a picture gallery on the score of its want of light?—No; the room was unfinished; its site was objected to, and the question remained for a long time undecided.

5387. Is not the lighting at present found insufficient by the keeper of the natural history collection?—He has complained of the direction of the light.

5388. And of the quantity of light?—I have never heard a complaint of the quantity of light, but of the direction of the light, which is certainly not satisfactory for table-cases.

5389. Is there provision made for the officers, in the way of private rooms, as part of the plan?—There is.

5390. In the plan now put in, which is the last plan adopted, what is the amount of accommodation proposed to be given to the officers for private study and research?—There are six rooms attached to the department of printed books and manuscripts, and four to the department of antiquities, and there are eight rooms on the first floor.

5391. That is upon the floor of the present King's Library?—There will be 10 upon the ground floor and eight on the first floor.

5392. What is the size of those rooms?—They differ in size.

5393. Sir *Robert Inglis.*] Will you state the size of the smallest?—The size of the smallest is rather larger than the one now occupied by the keeper of the manuscripts.

5394. Was it part of the original design to furnish each department with certain rooms for the purposes of study and research?—For the principal officer of each department it was.

5395. Has the officer, who has the charge of the print-room, any room in the new building?—He will have one.

5396. Where is his room to be?—Adjoining the print-room.

5397. Is it at present begun?—No; but he will have a room adjoining the print-room, when it is built.

5398. Are you aware of the present state of the room allotted to the keeper of the natural history collection?—I am.

5399. Are you aware that it is very imperfectly lighted?—I am; but it was not originally intended to be so lighted; when the plan was altered, instead of having a large window opening under the portico, there was no means of giving it light but by a skylight, which I considered not material then, having intended

451

tended to recommend that it should be added to the series of rooms thrown open to the public.

5400. Is it part of your plan to furnish him with another and better room?—It is, with another room lighted in a proper manner with a window.

5401. In which way it was intended that that very room should be lighted if the original plan had been adopted?—It was.

5402. Mr. *Hawes.*] What plan have you adopted for ventilating the buildings generally?—All those rooms which are open to the public are ventilated by large windows, the top of which are raised near to the ceiling. I have provided no artificial ventilation for those rooms.

5403. With reference to warming, have you decided upon any plan?—The rooms that are now finished are warmed by hot water, except in the east wing, which are warmed by a heating apparatus of warm air.

5404. Can you give the Committee any idea of the expense incurred for the warming apparatus?—I could inform the Committee of the expense of those fixed since 1832, by referring to the accounts, but I have not copies of the accounts made up previous to that time.

5405. Sir *Robert Inglis.*] How many furnaces are there actually in operation?—There are more provided than are in constant operation, because the number in use varies according to the weather, but I think at this time there are 16.

5406. How many do you propose to erect in the completion of the entire building?—I have never considered that.

5407. What is the average heat to which the rooms are brought during the six winter months?—It varies; in the King's Library, where some gentlemen are constantly employed, the temperature is seldom below 60; the same in the reading-rooms. In the upper room, where the public only pass through, I believe it is seldom more than 50.

5408. Lord *Stanley.*] In a work recently published by Mons. Von Raumer, great complaints are made of the manner in which the reading-room is warmed in winter, and he complains of having sustained great inconvenience. Have you any explanation to offer of that?—I was very much surprised on reading his account, because he states that he looked round in vain for fires, and felt so cold that flannel could not keep his feet warm. Now there are two stoves warming those rooms, and one of them is seldom used on account of the complaint frequently made of heat when they have been both lighted, so that we have hardly ever been required to use the power of heating which is provided; but had M. Von Raumer's complaint been that the air in the room was disagreable, I should have admitted the justice of his complaint; for not having provided any artificial means of ventilation, as the rooms are used only as temporary reading-rooms, and as they are much more frequented than was expected, the air in them is undoubtedly very bad when all the windows are kept closed.

5409. Sir *Robert Inglis.*] Are you aware of any means adopted in the Bibliothèque du Roi to maintain warmth?—There are none. Mons. Van Praet told me that they allowed none. I asked him how those persons were accommodated in this respect who went there to read. He said, they must keep themselves warm as well as they can.

5410. The average external temperature at Paris being considerably lower in winter than the average temperature in London?—So I understand.

5411. Mr. *Hawes.*] Is not the Elgin marble room warmed by hot air?—No, by hot water.

5412. It was warmed by hot air, was it not?—No.

5413. What portion of the building is warmed by hot air?—The Royal Library and the reading-rooms.

5414. Has the hot air and the air which has been vitiated by the public any means of escape?—It has. In the gallery of Athenian marbles there are openings above in the skylights, and it was difficult to counteract the effect which was produced by the rapid change of air when the weather is cold.

5415. It has been stated to another Committee that the Elgin marble room is warmed by an apparatus which takes its supply of air from the room itself, consequently from whence the air warmed and vitiated has no means of escape, and thereby produces a very unpleasant effect upon the visitors of that part of the building?—Whoever gave that evidence must have been mistaken or misinformed. The room is certainly warmed by the circulation of its own air, and that of the adjoining room, around vessels of warm water, but it is

Sir *Robert Smirke.*

23 June 1836.

open to the Egyptian gallery, in which there are 17 large windows, all of them being made to open; and there are, besides, the openings in the roof, which I have before alluded to.

5416. Lord *Stanley.*] You have stated that you were able to furnish the Committee with information as to the increased accommodation which would be afforded by the new buildings for the zoological collections, and that upon an inquiry of Mr. Children as to the amount of room that would be required, you found that you could afford him considerably more than that which he estimated as necessary. Will you have the goodness to furnish the Committee with the details of the area which is now available for the zoological collections, and that which it is proposed to make so available?—The present collection in that department of natural history which comprises zoology is contained in nearly 4,500 superficial feet of glazed cases against the walls, distributed in six rooms, and upon the staircase.

5417. Mr. *Hawes.*] That does not include the area of the floor?—No; the glazed cases against the walls.

5418. Calculating that the glass cases go up to the roof?—No, calculating the surface of the cases as they are in the existing collection, a part of which collection is in the new building. The height of these cases was fixed by the officer of the department. He has reported to the Trustees that he thinks it probable in the course of a few years the collection might be increased, as to many parts of it, nearly to three times the space it now occupies, making together an area required of glazed wall cases of 12,300 feet. In the rooms which I have proposed for this collection there is an area of 16,100 square feet, supposing the cases to be only eight feet high, though the cases at Paris are, I believe, none of them less than 10 feet high; we should then have a space of nearly twice the whole surface of wall-cases of the collection in the Museum of the Jardin des Plantes, and nearly four times the superficial area for table-cases on the floors.

5419. Lord *Stanley.*] Have frequent complaints been made to you with regard to the mode in which the light falls for the present mineralogical collection?—Complaints have often been made to me about it by the principal officer.

5420. The principal officer has frequently stated to you that it would be desirable to have a side light for the exhibition of the collection, instead of skylights?—He has stated that he considered it indispensable.

5421. Would it be possible in the arrangement of the new buildings to afford him that accommodation by means of side lights, at the same time giving an equal space for the exhibition of the collection?—The arrangement I have proposed will afford him a larger space for the collection than that which he now has, and will give side lights (windows) for the whole of it.

5422. You have stated that a very large increase of space will be obtained for the zoological collection, and that an increase of space will be obtained for the mineralogical collection, also affording side lights; what will be the provision for additional books and manuscripts?—With reference to the printed books, the arrangement which is shown upon this plan will provide for an increase of about the same number that there is now in the library: there are at this time about 240,000 volumes. I calculate that these plans will provide for an additional number nearly to that extent.

5423. What additional room for books and manuscripts will there be in the new buildings, as they now are, without any extension?—I can hardly say with regard to the manuscripts; probably one-fourth more than the present collection. With regard to the printed books, when they are removed from the old building into the new one, which is now finishing, there will remain a space in this new building of not quite one-fourth more (about two-ninths more) than the present collection, without any additions being made to the works now contracted for.

5424. No estimate or final plan has been yet agreed upon with regard to the south front?—No.

5425. Do you conceive it absolutely essential that the old south front should be removed, and a new building substituted?—It is quite indispensable; the building is in a very insecure state; most of the floors are supported by props concealed by the bookcases. In 1816, when I made the galleries which are now round those rooms, and the hangings were taken down from the surface of the walls

walls for that purpose, openings were found in several places into the flues; the apprehension of insecurity was then so great that it seemed likely to lead to an immediate removal of the whole collection. The danger consists in the chance of a fire taking place in the flues, and this is guarded against as much as possible by the practice of having the chimnies cleaned very frequently, and allowing no fires in them after four o'clock; by these precautions no accident has ever taken place, and the walls were made secure in every part where we could get at them.

5426. Has your attention been directed frequently, under the direction of the Trustees, to taking every possible precaution with regard to fire, and making provision in case such an accident should happen, in the new building? —Yes, certainly, and I have done it to the utmost extent that I could suggest.

5427. Do you conceive that the new buildings are as nearly protected from fire as it is possible that they should be?—Quite so; at the same time; if a fire took place in any room the collection in that room might be destroyed; and therefore I have provided, adjoining the rooms, in several places a supply of water, by which a discharge can be made instantly from a pipe attached to it, affording some chance of saving the collections in the rooms where such an accident might occur. A fire would not extend to the adjoining rooms unless there was very great negligence, as the only communication is at the doors, but in every other part the walls are made a complete separation, from the ground through the roof.

5428. The floors are in all cases made fire-proof?—They are all fire-proof.

5429. Mr. *Hawes.*] Have you not made some arrangement to prevent the spreading of fire in the room itself; so that provided a portion of a bookcase should take fire, you prevent the spreading of that fire by a little metallic or other separation, which would prevent the ascent of the cold air?—I have provided such a separation by slate: there is in each room a complete separation made at the galleries between the upper and lower bookcases, and another separation between the top of the cases upon the gallery and the finishings above them. I have also proved the reservoirs of water we have in the upper part of the buildings, and find that with the pipes that are fixed we can throw the water within any part of the building in an instant, discharging a jet of water nearly 45 feet in perpendicular height for more than half an hour, and during that time (or within 20 minutes) we can always ensure a farther supply from the New River Head. Engines are preparing also to be fixed upon the roofs.

5430. Lord *Stanley.*] Will that also tend to the security of the museum in case of there being a fire in any adjoining houses?—Very materially.

5431. Mr. *Hawes.*] Is there any provision made for the access of the firemen to the reservoirs in the Museum, in that case?—These engines being upon the roof, of course the firemen would have to pass through the building to get at them; but there are staircases for that purpose direct from the basement to the roof, and as the engines can be worked by two men, there may always be a command of that assistance without the admission of many strangers. The internal supplies require only one man to each, as the hose is fixed to a cock, through which when turned the water flows instantly.

5432. Lord *Stanley.*] In case it should within a limited period become necessary to make still further extensions, with a view to the library, would it be possible to extend the building without interfering with the architectural effect?—I have shown upon this plan the additions which I am extremely desirous should be adopted by the Trustees, because, comparatively at a very small expense, I can provide accommodation for very nearly 200,000 volumes.

5433. Would that accommodation be adjoining to and conveniently situated with reference to the present arrangement of the books and of the readers?—It is with reference to the convenience of the reading-rooms that the additions are placed, because if the books are remote, they will be of little service there.

5434. Where is it that you propose to make such addition?—Along the back or east side of the Royal Library.

5435. That is upon the outside of the east wing?—Upon the eastern side of the east wing.

5436. And on the same floor?—Yes. I wish also to state that, when first engaged upon the plans, perceiving how much uncertainty there was as to the arrangements that would be required, I have provided flues in the construction

Sir *Robert Smirke.*

23 June 1836.

of the walls, by which chimnies for these and many other additions can be given; there are in the present building 81 flues, 35 of which are unappropriated, and may be applied in different parts of the building to any additions not now foreseen.

5437. Now supposing it were desired still further, for any purpose, to extend the buildings of the Museum, is there any available space upon the west or upon the north sides?—Upon the west side there is a good deal of available space, but not upon the north.
